Further Transit Loan Urged in Philadelphia.—Mayor Blankenburg of Philadelphia, Pa., has sent a message to Councils urging that every expedient be used in passing the legislation necessary for a new permanent loan of \$1,250,000 toward the construction of the Frankford elevated and other rapid transit facilities so that the proposal may be submitted to a vote of the people at the November election. With it the Mayor transmitted a letter on the subject from Transit Director Taylor, in which the latter said that he did not believe the city would be justified, from a business standpoint, in awaiting a special election to be held subsequent to the proposed amendment to the constitution.

Third Annual Engineering Conference in Pennsylvania.—An exhibition is to be held on Nov. 15 to 19 inclusive in Harrisburg, Pa., in connection with the third annual Pennsylvania Industrial & Public Welfare & Engineering Conference. The first two exhibits have been representative of the very best products of the safe, economical and efficient industrial development and also indicative of what the industrial and public service companies are doing to promote the health and welfare of the people. The Department of Labor and Industry and the Public Service Commission will participate in the exhibition. J. W. Reynolds, vice-president of the Pennsylvania Steel Company, is chairman of the exhibit committee.

National Fire-Prevention Day.—Saturday, Oct. 9, the anniversary of the great Chicago fire, has been designated by the Safety First Federation of America as the national fire-prevention day and extensive plans have been formulated for observing this anniversary in a fitting manner in various cities throughout the country. An appeal has been made to the Governor of each State requesting that a proclamation be issued designating Oct. 9 as the national fire-prevention day. In his letters to the Governors, Frederick H. Elliott, executive secretary of the federation, calls attention to the necessity of impressing upon the minds of the people the need of their co-operation to prevent the unnecessary loss of life and property by fire.

New Commonwealth Edison Publication.—The Commonwealth Edison Company, Chicago, Ill., has just issued a booklet of eighty-six pages under the title "Rules and Information Pertaining to Electric Service, Meters, Wiring and Motors." This is issued for the purpose of acquainting customers, contractors, architects and engineers with the requirements of the Commonwealth Edison Company pertaining to the installation of service connections, meters, wiring, motors, and other appliances which are to be supplied with electricity from the company's main. The rules are supplementary to the electrical code of the city of Chicago, and they contain considerable information of technical value. One-half of the booklet is taken up with dimensioned and other diagrams of meter mountings.

Application for Franchise in Cincinnati.—The West End Rapid Transit Company has asked the City Council of Cincinnati, Ohio, for a franchise for the extension of its line from Anderson's Ferry to the corner of Third and Sycamore Streets in the city. The route is the same as mentioned in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11. All fares and charges of the company for carrying passengers and merchandise are to be so fixed that the net revenue shall be sufficient to pay not less than 10 per cent on the total amount invested in the property and equipment. After setting aside all charges for operating, a reasonable amount for depreciation and the 10 per cent return, the remainder of the surplus is to be divided equally between the company and the city. The books are to be open to the city from time to time, so that the amount invested may be ascertained, as well as the earnings and the disposition of the funds. C. E. Hooven is president of the company, and Stanley Shaffer is secretary.

Appeal in Toronto Case Unlikely.—North Toronto residents are not in favor of an appeal against the decision of the Ontario Railway Board, giving the Toronto (Ont.)

Railway running rights over that portion of Yonge Street north of the Canadian Pacific Railway tracks up to Farnham Avenue, on which the Toronto & York Radial Railway formerly operated. At a meeting of the Ratepayers' Association on Sept. 17 the recommendation of the Board of Control that the decision be appealed was strongly condemned, and the Aldermen of the Second Ward and Third Ward were urged to oppose the recommendation. One Alderman promised to do so, but the others stated that it was their intention to cast their votes in the interests of the city generally and not in the interests of a particular locality. They were willing to join a deputation to the Toronto Railway to request that company to lay tracks from its present terminus to Farnham Avenue, where passengers from the Toronto & York Radial Railway might transfer to the other system. A petition will be presented to the City Council on Sept. 20 praying against the plan to proceed with the appeal.

Obstacles to Construction of Line Under East River Removed.—The Public Service Commission for the First District of New York has received from Henry Breckenridge, Acting Secretary of War, the modification requested by the commission in the permit from the War Department for the right to construct a rapid transit railroad under the East River from Fourteenth Street, Manhattan, to North Seventh Street, Brooklyn. This is a part of the Fourteenth Street-Eastern line of the dual system. In the permit as originally issued by the War Department responsibility for all damage or loss during the work was laid upon the city of New York. The commission objected to this clause and the government has now modified it so as to make the city assume "all legal liability" for loss or damage due to construction or operation. The modified permit also gives the commission permission to construct a temporary ventilation chamber outside of the bulkhead line at the foot of North Seventh Street, Brooklyn, on condition that all such structures outside the bulkhead line shall be entirely removed when the work is completed. This removes the last obstacle to the beginning of work on the Fourteenth Street-Eastern line and in a few weeks the commission will advertise for bids for the construction of the tunnel section.

PROGRAMS OF ASSOCIATION MEETINGS

Mississippi Electric Association

Owing to objection on the part of some of the members to the dates of Nov. 10 and 11 as the meeting time of the Mississippi Electric Association it has been decided to change the dates to Nov. 12 and 13.

Annual Congress National Safety Council

The fourth annual congress of the National Safety Council will be held at Philadelphia, Pa., on Oct. 19, 20 and 21. Accident prevention in all its phases will be discussed and the particular problems of the various industries will be presented in separate meetings. Dr. E. B. Rosa, acting director bureau of standards, Department of Commerce, Washington, D. C., will be chairman of the public utilities sectional meetings, to be held on Oct. 20, 1915. The program for this session is as follows:

"Linemen and Their Operations," by C. B. Scott, manager bureau of safety, Middle West Utilities Company, Chicago, Ill.

"Danger of Low-Tension Shocks," by H. S. Warren, American Telephone & Telegraph Company, New York.

"Hazards of High-Tension Lines," by Bryce E. Morrow, chief engineer Utilities Mutual Insurance Company, New York.

"Hazards of Gas Works," by J. B. Douglas, manager claim department United Gas Improvement Company, Philadelphia, Pa.

"Hazards of Street Work," by Edward C. Spring, assistant to the president Lehigh Valley Transit Company, Allentown, Pa.

"Education of Street Car Platform Men," by Rex. D. Billings, general claim agent Reading Transit & Light Company, Reading, Pa.

Financial and Corporate

Manila Electric Railroad & Light Corporation

The statement of income, profit and loss of the Manila Electric Railroad & Light Corporation, Manila, P. I., for the calendar year 1914 follows:

Gross earnings	\$1,602,001
Operating expenses and taxes.....	818,415
Net earnings (After allowing for loss of \$9,324 in operating Union Truck Company).....	783,586
Fixed charges—interest on bonds.....	277,716
Surplus over fixed charges.....	\$505,870
Reserves:	
For sinking fund	\$28,250
For replacements and renewals.....	80,000
Total	\$108,250
Surplus	\$397,620
Dividends	350,000
Net surplus for the year.....	\$47,620
Surplus at beginning of year.....	1,253,337
Credits:	
Amount carried as reserve for sinking fund transferred to surplus	39,353
Earnings for prior period.....	2
	\$1,340,312
Charges:	
Expenses of ice plant investigation written off.....	\$6,228
Expenses prior period	850
Exposition fire loss	3,645
Surplus Dec. 31, 1914 (excluding reserves).....	\$1,329,589

The gross earnings for the year showed a decrease from the previous year of \$96,582, or 5.62 per cent. The operating expenses and taxes increased \$27,628, or 3.49 per cent, so that the net earnings from operation decreased \$124,220, or 13.68 per cent. Of the decrease of \$96,592 in the total gross earnings, \$82,000 occurred in the railway department. Up to June 30, 1914, the decrease was less than 1 per cent, the balance of the loss occurring during the latter part of the year. The electric department earnings fell behind a little more than \$9,000, or only a fraction over 1 per cent, the balance of the shrinkage being caused by the closing down of the trucking department.

During August heavy rains caused serious floods in Manila, and during September the city experienced the worst flood in its history. These floods caused a loss of considerable revenue and resulted in additional expense in repairing track, roadway, rolling stock and power plant. The increase in expenses was owing largely to the heavy growth in the number of electric customers, which necessitated an addition to the electric staff. This in itself created enlarged overhead expense, and the natural considerable increase in fuel consumption was emphasized by a larger average cost per ton of coal purchased. The company expended during the year for new construction \$129,015; for replacements and renewals, \$62,241, and for maintenance, which was included in operating expenses, \$158,466.

Business and financial conditions in the Philippine Islands during the year were far from satisfactory. In the beginning of the year the general world-wide depression began to be felt and after the commencement of the European war the situation became gradually worse. The last five months of the year were the dulllest period experienced in the history of the company.

Augusta-Aiken Railway & Electric Corporation

According to the annual report of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., for the year ended Dec. 31, 1914, the gross earnings amounted to \$738,372 and operating expenses and taxes to \$393,886, leaving income from operation of \$344,486. Interest and sinking fund charges were \$282,962, and the gross surplus for the year was \$61,523. The gross electric earnings increased \$19,265 or 6.6 per cent, with a decrease in expenses of \$11,733 or 10.1 per cent. The gross railway earnings decreased \$4,768 or 1.3 per cent, and expenses decreased \$46. The gross earnings from other departments decreased \$1,197 or 1.8 per cent and expenses decreased \$1,409 or 3.6 per cent.

For the first ten months the total gross earnings were approximately \$30,000 greater than for the same period of the preceding year; of this increase more than \$15,000 (\$14,000 in railway department) was lost during the last two months owing to the unprecedented business chaos. The operating expenses for the year showed a saving of \$14,225; taxes were \$6,000 higher, and the fixed charges increased by more than \$75,000. As a result surplus suffered a decrease during the year to the extent of more than \$55,000.

During the year \$120,000 of additional 5 per cent sinking fund gold bonds were placed in the treasury to cover cost of additions, betterments and extensions, made previous to Nov. 30, 1914. Of these \$20,000 were sold. A total of \$250,000 of first mortgage 5 per cent sinking fund gold bonds of the Georgia-Carolina Power Company was issued to cover the cost of completing that plant and sold. Two dividends of 1½ per cent each were paid on the cumulative preferred stock, but with the outbreak of the war in Europe and the consequent falling off in earnings, the directors suspended payment of dividends on the preferred stock from July 1, 1914.

A sum of \$96,903 was expended for additions and betterments and charged to capital accounts. Of this amount \$53,064 was expended for line extensions and the necessary apparatus for connecting new customers; \$13,675 was for a new substation at the city plant, and the balance for miscellaneous improvements, including a 2-mile extension of the railway lines to Aumond.

American Public Utilities Company

The combined statement of income, profit and loss of the subsidiaries of the American Public Utilities Company, Grand Rapids, Mich., for the year ended June 30, 1915, follows:

Gross earnings from operation.....	\$2,932,069
Operating expenses	1,618,239
Net earnings from operation.....	\$1,313,830
Miscellaneous income	25,930
Gross income	\$1,339,760
Less expenses	\$38,101
Net income	\$1,301,659
Interest charges	952,108
Remainder	\$349,551
Dividend on preferred stock.....	234,840
Balance	\$114,711

The gross earnings from operation increased during the year from \$2,319,955 to \$2,932,069, net earnings from operation increased from \$980,879 to \$1,313,830, and expenses decreased from \$51,485 to \$38,101. The comparative net income for the respective years was \$974,696 in 1914 and \$1,301,659 in 1915. The increase in fixed charges was from \$599,309 to \$952,108. These increases in gross and net earnings and in the fixed charges were caused by the acquisition and financing of the properties of the Chippewa Valley Railway, Light & Power Company (merged into the Wisconsin-Minnesota Light & Power Company) and by the large expenditures, approximately \$1,500,000, made by the Merchants Heat & Light Company and by the Wisconsin-Minnesota Light & Power Company for extensions and additions to their properties. The net income available for dividends decreased slightly because the fixed charges included interest on investments made during the last year, which did not become remunerative until late in the present fiscal period.

During the year the Capitol Light & Power Company, a competitor of the Jackson Light & Traction Company, Jackson, Miss., retired from business on account of unsatisfactory revenue conditions, and as a result a substantial increase of business accrued to the electric lighting department of this subsidiary. A movement to establish a municipal lighting plant was met by a publicity campaign which assisted in producing an adverse vote of the electors. The street railway income of this subsidiary was unfavorably affected by a jitney service which was established in Jackson during the year. According to the annual report of the holding company, this is a problem which still remains to be dealt with.

TAXES ASSESSED IN VIRGINIA

The total value of the tangible and physical property of electric railways operating in Virginia, as assessed by the State Corporation Commission for the calendar year 1914, was \$8,933,873. The State property tax upon this assessed value, the tax on money and the franchise tax assessed upon the annual gross transportation receipts amounted to \$83,225. The total State taxes assessed against electric carriers for the preceding year was \$81,002, an increase for 1914 of \$2,223. During 1914 the total value of the tangible and physical properties of the canals and steam railroads in the State was \$122,120,868, and the total State taxes imposed amounted to \$1,084,220, an increase for 1914 of \$48,903. The assessed property values of light, heat, power, gas and water companies operating in the State totaled \$10,114,941 for 1914, upon which the total taxes amounted to \$60,237, an increase over 1913 of \$4,449. The accompanying table shows the details of the taxable values

TABLE SHOWING THE 1914 TAXABLE VALUES OF ELECTRIC RAILWAY PROPERTIES IN VIRGINIA, AND THE TAXES ASSESSED THEREON, AND THE FRANCHISE TAX ASSESSED UPON THE GROSS TRANSPORTATION RECEIPTS FOR THE YEAR ENDED JUNE 30, 1914

Name of Company	Track Miles	Value	Value of Rolling Stock	Value of All Other Property	Total Property Value	Tax on Property	Franchise Tax	Total Tax

Grand total.....	435.89	\$5,514,498	\$1,577,495	\$1,841,800	\$8,933,873	\$31,268	\$51,188	\$83,225

of electric railway properties in Virginia for 1914 and the taxes assessed thereon, as well as the franchise tax assessed. The tax on money is omitted, the total for all companies for the year being only \$768.

SECURITIES LOST IN EUROPE

It is reported that the Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., probably will experience considerable difficulty in adjusting the matter of bearer share warrants lost during the European war. There are a large number of stockholders in Belgium who secreted their securities when the German invasion began. Many of these stockholders have been killed and no one knows the hiding place of the securities. The warrants, which bear coupons payable to bearer, are probably lost beyond all chances of recovery. Claims are being made on the company to have duplicate warrants issued, but it is expected that considerable difficulty will arise in proving claims to the lost stock. Other companies will have the same trouble, as substantially all securities held in Belgium and northern France were made to bearer and at the outbreak of war these were secreted for safe keeping. Many complications and much litigation is expected over these lost securities.

Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont.—J. S. Lovell has been elected a director of the Brazilian Traction, Light & Power Company, Ltd., to succeed the late Sir William Van Horne.

Camaguey (Cuba) Company, Ltd.—The Electric Bond & Share Company, New York, which some time ago took a ninety days' option on the \$1,000,000 stock of the Camaguey Company, Ltd., at \$50 a share, has decided not to exercise the option. Officials of the company state that bank obligations have been nearly all paid off and there is a probability that with the close of the current year there may be funds to pay a small dividend on the stock.

Chicago (Ill.) Surface Lines.—Complaints made to the Illinois Public Utilities Commission by J. B. Hogarth against the Chicago Railways and the Chicago Surface Lines were dismissed on Sept. 14 on motion of Mr. Hogarth. Among the complaints made by Mr. Hogarth were the following: As to the "unjust, unwarranted and unreasonable salary" paid John M. Roach as one of the members of the board of operation of the Chicago Surface Lines and as one of the directors of the Chicago Railways; as to the Chicago Railways carrying items of paving expenditures in the joint capital account with the city; as to the application of the Chicago Railways for authority to issue \$3,145,000 of first mortgage bonds, and as to the system of accounting of the Chicago Railways.

Columbus, Delaware & Marion Railway, Columbus, Ohio.—The Common Pleas Court has decided that the Columbus, Delaware & Marion Railway is not liable as guarantor on the \$500,000 of first mortgage bonds and the \$96,000

interest due thereon of the Columbus, Marion & Bucyrus Railroad. When these bonds were issued, the Columbus, Delaware & Marion Railway guaranteed them by endorsement as to principal and interest. On default by the Columbus, Marion & Bucyrus Railroad, the Troy (N. Y.) Trust Company, as trustee of the bonds, brought suit to enforce the guarantee.

Columbus Railway, Power & Light Company, Columbus, Ohio.—An initial quarterly dividend of 1 per cent has been declared on the prior preference stock of the Columbus Railway, Power & Light Company, in addition to the regular quarterly dividend of 1½ per cent on Series A preferred stock. Both of these dividends are payable on Oct. 1 to stockholders of record on Sept. 15.

Demerara Electric Company, Ltd., Halifax, N. S.—The directors of the Demerara Electric Company, Ltd., which does the entire lighting and tramway business in Demerara, British Guiana, have decided to omit the quarterly dividend of 1 per cent usually paid on Oct. 1. This omission is caused by conditions brought about mainly by the European war, resulting in an increase in the cost of fuel and a decrease in the general traffic.

Kansas City Railway & Light Company, Kansas City, Mo.—The Kansas City Railway & Light Company stockholders, it is stated, have accepted the plan formulated by Federal Judge Hook for the reorganization of the Metropolitan Street Railway and the Kansas City Electric Light Company, as described in the ELECTRIC RAILWAY JOURNAL of Aug. 21. A supplementary plan, not providing for any assessment on Kansas City Railway & Light Company stock, will soon be issued.

Long Island Railroad, New York, N. Y.—Earl T. Shaw, 30 Broad Street, New York, has offered to purchase at 60, less commission of 2½ per cent to be paid by the seller, a block of 25,000 shares of Long Island Railroad stock. The certificates must have been issued not later than 1910 and

proxies must not have been put out against the same in favor of control by the Pennsylvania Railroad management.

New Orleans Railway & Light Company, New Orleans, La.—The gross earnings of the New Orleans Railway & Light Company for the six months ended June 30, 1915, amounted to \$3,520,748 as compared to \$3,596,463 for the corresponding six months in 1914. Other statistics for the six months' periods follow: Net after taxes—1915, \$1,386,821; 1914, \$1,482,475; miscellaneous deductions—1915, \$18,184; 1914, \$14,253; bond and other interest—1915, \$870,198; 1914, \$854,185; renewals and replacements—1915, \$75,166; 1914, \$130,871; surplus—1915, \$423,273; 1914, \$483,166.

Providence & Fall River Street Railway, Swansea Center, Mass.—In the United States District Court in Boston Judge Morton on Sept. 22 declined at present to appoint a receiver for the Providence & Fall River Street Railway, after considering a petition for such appointment brought last week by the Industrial Trust Company, Providence, R. I. The trust company holds the road's bonds to the amount of \$165,000. Counsel for the railway opposed the receivership on the ground that no bonds have yet failed to receive interest, the next date when interest is due being Oct. 1. Conditions are beginning to improve on the road and the appointment of a receiver at this time would merely increase the cost of administering the property. This has been economically carried on during the last three years by a noteholders' committee. Several Massachusetts banks and the Rhode Island Company also opposed a receivership.

Public Service Corporation of New Jersey, Newark, N. J.—The monthly financial statement of the Public Service Corporation of New Jersey for August shows a gross increase of \$54,473 in total business over August of last year. The percentage of gain was 1.8 per cent. The total gross increase in all business for the eight months' period to Aug. 31 was \$806,282, the percentage of gain for the period being 3.5 per cent. The balance available—after payment of operating expenses, fixed charges, sinking fund requirement, etc.—for amortization, dividends and surplus, for August, 1915, was \$230,303, while the decrease in surplus available for dividends over the corresponding period of 1914 was \$41,363. For the eight months ended Aug. 31, 1915, the balance available for amortization, dividends and surplus was \$2,094,947, and the increase in surplus available for dividends was \$145,383.

Seattle (Wash.) Municipal Street Railway.—A. L. Valentine, superintendent of public utilities, states in his report to the City Council that Division "A" and Division "C" of the Seattle Municipal Street Railway were operated at a loss of \$2,167 during August. Division "C" cost \$2,416 to operate, and the revenues amounted to \$2,111, making a loss of \$305 on that line. Division "A" was operated at a cost of \$1,823 and its revenues amounted to \$1,554, or a loss of \$269. To this should be added an interest charge of \$1,593, bringing the total loss for Division "A" to \$1,862.

United Light & Railways Company, Grand Rapids, Mich.—N. W. Halsey & Company, New York, are offering at par and interest an additional \$750,000 of 6 per cent gold coupon notes of the United Light & Railways Company, dated Jan. 1, 1915, and due on Jan. 1, 1918 and 1920. The notes due on these dates are callable as a whole or in part upon four weeks' published notice at 100 and interest, and 101 and interest respectively. The proceeds of these notes will complete payments on property heretofore acquired and reimburse the treasury for improvement work. The present outstanding \$2,250,000 of these notes is secured by \$3,000,000 of first and refunding mortgage 5 per cent bonds on a 75 per cent basis.

DIVIDENDS DECLARED

Bangor Railway & Electric Company, Bangor, Me., quarterly, 1¼ per cent, preferred.

Cincinnati & Hamilton Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Columbus Railway, Power & Light Company, Columbus, Ohio, 1 per cent, prior preference; quarterly, 1½ per cent, preferred, Series A.

Halifax (N. S.) Electric Tramway, Ltd., quarterly, 2 per cent.

New Orleans Railway & Light Company, New Orleans, La., quarterly, 1¼ per cent, preferred.

New York State Railways, Rochester, N. Y., quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Northern Ohio Traction & Light Company, Akron, Ohio, quarterly, 1½ per cent, preferred.

Philadelphia Company, Pittsburgh, Pa., 3 per cent, cumulative preferred; quarterly, 1½ per cent, common.

Porto Rico Railways, Ltd., San Juan, P. R., quarterly, 1¼ per cent, preferred.

Republic Railway & Light Company, New York, N. Y., quarterly, 1½ per cent, preferred.

Ridge Avenue Passenger Railway, Philadelphia, Pa., quarterly, \$3.

Toronto (Ont.) Railway, quarterly, 2 per cent.

United Light & Railways Company, Grand Rapids, Mich., quarterly, 1½ per cent, preferred.

Washington Water Power Company, Spokane, Wash., quarterly, 1¼ per cent.

West India Electric Company, Ltd., Kingston, Jamaica, quarterly, 1¼ per cent.

Traffic and Transportation

JITNEY JOTTINGS

Further Action Before the Public Service Commission of New York—The Philadelphia Injunction Suits

The International Railway, Buffalo, N. Y., has filed a complaint with the Public Service Commission of the Second District, against Albert G. Gould alleging that he is operating a jitney bus line in Buffalo, known as the Silver Star Line or the Silver Sightseeing Line, in violation of the Thompson jitney bus law, and asking that he be restrained. The company alleges in the complaint that the line is run from East Masten and Utica Streets on Masten to Dodge Street, to Ellicott Street, to Goodrich Street, to Main Street and to Seneca Street in competition with the lines of the International Railway, without a certificate from the Public Service Commission, and carrying passengers for a fare of 5 cents—all of which operation the company alleges is in violation of the law as interpreted in the recent decision of the courts in the case of the commission against Burt C. Hurtgam, Lockport. With regard to the charge of a 5-cent fare the complaint says that the line is "carrying passengers without collecting fare until the fifth passage of such passengers is consummated when a fare of 25 cents is collected for the five passages upon said cars." This, the complaint alleges, is an evasion of the law, which applies specifically only to lines carrying passengers for 15 cents or less.

The first of the two hearings for injunctions against the jitney ordinance passed by the Councils of Philadelphia, Pa., came up recently before Judge Patterson in Common Pleas Court No. 1 and the Judge postponed consideration of the case until Sept. 28, when the original suit for a restraining order will be heard by all the judges of Common Pleas Court No. 1 sitting together. Judge Patterson said the jitneymen had failed to take advantage of an opportunity to get a temporary injunction, afforded to them by Judge Sulzberger, by not filing the \$2,500 bond required by the order of the court, and he declared that he saw no reason for reopening the case at this time. City Solicitor Ryan filed an answer to the suit of the jitney association in which they sought an injunction against Councils' ordinance. The answer was a general denial of the claims of the jitneymen that the ordinance was "confiscatory and discriminatory." When the application of the Auto Bus Company for an injunction against the jitney ordinance came before Judge Fineletter in Common Pleas Court No. 4, the judge took the same view as Judge Patterson. He stated that the merits and demerits of the jitney act would be fully threshed out at the final hearing, and declined to interfere at present.

The Mayor of Newark, N. J., has returned to the Board of Works of that city with his veto the jitney regulatory ordinance referred to in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11, page 467. The veto has been overridden.

A very interesting communication on the jitney appeared recently in one of the local papers at San Diego, Cal. It was signed "A Business Woman." It is understood that the letter to the editor was contributed by a member of the staff of the San Diego Electric Railway who has served the company for eleven years. The communication, some 1500 words in length, was concluded as follows:

"We are a queer people. We have spent time, thought and hundreds of thousands of dollars to create commissions to compel public utilities to have due regard for our rights. We are carrying a heavy tax to maintain these commissions. Every time we hear they have rendered a decision in our favor against a public utility, we are filled with complacency that in our great wisdom we have made this thing possible. And now along comes the jitney bus—a new transportation scheme, a common carrier—and because it appeals to a mood, or a sympathetic streak, or satisfies a grudge we have against corporations, we form another flashlight judgment and cheerfully set aside the expensive, extensive regulative machinery we have built and maintain to protect us. We render null the ability to insure reasonable fare, for instance, by encouraging an unregulated system which so cuts into the receipts of the established, governed system that it must increase rates, or decrease service, or do other un-

desirable things in order to live. Is it mere extravagance on our part? Or the gambling instinct which is always willing to take a chance? Or is it that we have regulated the railroads down to a fine point, got them just where we want them, produced a finished article of the regulated variety, and now we are looking to the future in developing something new in the way of the jitney bus business so that in a few years we shall have fresh material upon which to exercise our talents for minding the other fellow's business?"

The history of the attempt to regulate the jitney in Portland, Ore., is very interesting. The first jitney appeared in Portland in December, 1914. Commissioner Daly promptly prepared a drastic ordinance and presented it to the Council. Hearings were held and the measure was modified by Mr. Daly. After several months of delay the Council adopted the modified measure. The jitney interests then invoked the referendum on the measure as passed, thus submitting it to a vote of the people. The Council's measure was adopted by the voters at the city election on June 2. A jitney inspector was then appointed, and the city started to enforce the ordinance. The jitney interests promptly started litigation and secured a temporary restraining order in the Circuit Court. The State Supreme Court decided against the measure on a technicality. Mayor Albee then urged the Council to pass the measure over again in the identical form adopted by the voters. Commissioner Daly subsequently presented a modified measure, and the Council after killing the Mayor's measure passed Mr. Daly's measure with an emergency clause. The city then started to enforce the new measure, but the jitney interest on September 14 secured a ten-day restraining order from Circuit Judge Bagley.

No decision has been rendered yet on the application of the Public Service Commission of the Second District of New York to Supreme Court Justice Hasbrouck at Kingston for a permanent injunction restraining James E. Adams, Corning, and Elmer G. Booth, Rochester, from operating jitney lines without the consent of the local authorities or a certificate of public convenience and necessity from the commission. The petition was heard on Sept. 4 at Kingston. The bringing of the action was referred to in the *ELECTRIC RAILWAY JOURNAL* of Aug. 14, page 292.

SEEK TO RESTRAIN JITNEY IN TERRE HAUTE

Trustee for Bondholders Applies to the United States District Court for Injunction

A new feature in the jitney situation at Terre Haute, Ind., was introduced on Sept. 14 when a petition for a restraining order against the jitney drivers in that city was filed in the United States District Court at Indianapolis by the Fidelity Trust Company, Philadelphia, Pa., trustee under the mortgage of the Terre Haute Indianapolis & Eastern Traction Company. Sixty persons are named in the suit, which is in the form of a bill of equity, the petition stating that the jitney buses in Terre Haute are being operated by the persons named, and others unknown, instead of by organized companies.

The bill recites the history of the first franchise grants to the street railways in Terre Haute, and the further development of the property and extension of franchises prior to and following the lease to the Terre Haute, Indianapolis & Eastern Traction Company. It is shown that the grant or charter to the company provides that, during the time the privileges were granted to the company, the city of Terre Haute shall not "extend, grant to or confer upon any person or corporation any privilege which will impair or destroy the rights and privileges herein granted to the said company." It is also shown that under the public service commission law no license or franchise shall be granted to any person or corporation to operate any public utility where a similar utility is already engaged in similar service, without securing from the commission, after public hearing, a declaration that the public necessity requires such duplication of service. W. H. Latta, attorney for the company, stated that the company proposed to show that the jitney bus operators had received no grant from either the State or city to operate in Terre Haute, and that they were a menace to the community, operating on uncertain

schedules and, as shown by checkings made during the months of July and August, they have been operated on a losing basis, the latter feature emphasizing their inability to run on a regular schedule.

It is also cited in the appeal for the injunction that the jitney bus drivers of Terre Haute have organized what is known as the Jitney Bus Drivers' Union No. 168, which is a trades union recognized by the Central Labor Union of that city. It is then stated that the Central Labor Union started a boycott against the local street railway lines in Terre Haute in January, 1915, and that since that time the receipts from the operation of the Terre Haute city lines have been very seriously decreased. Mention is made in the bill of the manner in which the jitney bus drivers have been conducting their business, making it a practice to drive between the street cars and the curbs, appearing in crowds awaiting street cars, and being unusually active when transportation is in demand during the rush hours and on holidays, etc.

A hearing has been asked before Judge Arthur B. Anderson on Sept. 24.

SKIP STOPS SAVE TIME

Satisfactory Results Reported From Milwaukee in Experiment With Skip Stops on Three Short Lines

On Sept. 3 The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., gave out a statement showing the time saved on the three lines on which the experiment with skip stops is being made. Commenting on the figures the company said:

"Thus it will be seen that the average saving for each period of the day on the three lines being tested is 11 per cent, or seven minutes every hour. The lines under test are short runs, and but few stops are eliminated to accomplish this improvement in the service, as will be seen by the following:

"On the Farwell-Downer route twelve stops out of a total of fifty-two have been eliminated.

"On the Walnut-Pabst route twenty-three stops out of a total of seventy-one have been eliminated.

"On the Reed-Greenfield-Burnham route twenty-one stops out of a total of seventy-four have been eliminated.

"The report of our engineers shows that for an average day on the Farwell-Downer route formerly 33,198 persons, or 94.6 per cent of the total, boarded and alighted from the cars at designated stops, and 1895 persons, or 5.4 per cent, at the stops which have been cut out.

"On the Walnut-Pabst route formerly 25,367 persons, or 81 per cent of the total, boarded and alighted from the cars at designated stops and 5939 persons, or 19 per cent, at the stops which have been cut out.

"On the Reed-Greenfield-Burnham route formerly 25,895 persons, or 89 per cent of the total, boarded and alighted from the cars at designated stops and 3163 persons, or 11 per cent, at the stops which have been cut out.

"The conclusion, therefore, is:

"All persons using these three lines have been benefited by the improvement in the service to the extent of the saving of one-eighth of their time while riding on the cars. Only a relatively few passengers have been discommoded by being required to walk a short distance. Such inconvenience has been more than compensated for by the benefits derived from the improved service. The success and popularity of the plan so far prompts the belief that further improvement in the running time on these lines may be anticipated before the completion of the test. Similar results may be expected upon all other lines in the city when our patrons give their final approval to the plan."

WELFARE WORK OF THE INTERBOROUGH

In the annual pamphlet report of the Interborough Rapid Transit Company, New York, N. Y., for the year ended June 30, 1915, the following reference is made to the welfare work of the company:

"Considerable space was devoted in last years' report to a description of the efforts which your management is making to promote the welfare of its employees. That these efforts are appreciated is shown by the reduction in the

number of men leaving the service over a given period. This reduction is best illustrated by the following comparison for the six months ended June 30, 1912, with the same period for 1914:

	June 30, 1912, Per Cent	June 30, 1914, Per Cent
Number of employees leaving service.....	35	19.3
Number of motormen leaving service.....	16	1.1
Number of conductors leaving service.....	4	2.9
Number of guards leaving service.....	17.2	5.4

"Your company has had under consideration for some time a plan whereby the hours of ticket agents, gatemen, porters and platform men on the subway and elevated divisions could be reduced to ten hours a day without disarranging the present satisfactory schedule of service. Following a thorough investigation, a way has been found for placing all of the above service classifications on a ten hour a day basis so that approximately 80 per cent of the men will have straight ten-hour shifts. This classification went into effect on July 1, 1915."

Ordinance Against One-Man Cars.—The city of Belleville, Ill., has passed an ordinance requiring the East St. Louis & Suburban Railway to discontinue the one-man cars and to place both conductors and motormen on all street cars operating in that city.

Trial with New Cars in Toronto.—D. M. McIntyre, chairman of the Ontario Railway & Municipal Board, said on Sept. 7 that the new type of street car which the Toronto Railway has had on trial had met with the approval of the board. The new car is equipped partly with longitudinal seats and partly with cross seats, and has an inside aisle instead of an outside running-board.

The Joliet Arbitration.—John W. Downey, an attorney of Joliet, has been selected as the third member of the arbitration board of the Chicago & Joliet Electric Railway. Samuel J. Drew and E. Meers are the other two arbitrators. A new scale was demanded recently, and as the agreement between the company and the men provided for arbitration in case no decision could be reached the men selected Mr. Drew and the company selected Mr. Meers. The men want 33 to 36 cents an hour. The old scale provided for payment of 27 to 30 cents an hour.

First Aid in Brooklyn.—A system of first aid to the injured has been developed by the Brooklyn (N. Y.) Rapid Transit Company to a high state of efficiency. An improved portable first-aid case with equipment for use both by an instructed layman and by a physician has been developed by the physicians of the medical inspection bureau. Sixty-eight of these cases have been installed in the depots, terminals, shops and power houses of the company, and supplied to emergency and other crews required to work out on the lines. Wherever a first-aid case has been installed, a sufficient number of employees have been instructed in approved methods of first-aid to insure the presence of some qualified individual at all hours of the day or night when work is going on.

"Courthouse Advice."—More "courthouse advice" is being given to the trainmen of the Louisville (Ky.) Railway by N. F. Funk of the legal department. This last preaching is devoted to the matter of talking so that the jury can hear what the witness is saying. Mr. Funk said: "Talk loud on the witness stand. I wish we could engrave this sentence in letters of fire on every employee's brain. We have lost more cases through this apparently trivial neglect than because of any other reason. I have seen a man the size of Jess Willard take the witness stand and have a 100-lb. judge roar in fury at him for not talking loud, finally resulting in the judge losing his temper, the jury losing their patience, and the company losing the case. If there is anything more annoying than for a man to try to hear another man talk simply because the party of the second part will not raise his voice I have not discovered it."

Protecting Grade Crossings on the Pacific Electric Railway.—Thirty-two automatic wigwag warning signals will be installed at grade crossings of the Pacific Electric Railway in southern California. After a thorough investigation by the experts of the Railroad Commission, the railway has voluntarily agreed to protect thirty-two more

crossings by these automatic signal devices. This is the largest number of safety installations ever agreed upon at one time by any company in the State. The question of making crossings safer in Los Angeles County, either by departure from grades, over or underneath the tracks, or by flagmen or automatic signals, has been the subject of conferences in Los Angeles between the Railroad Commission, governmental and civic bodies, and the railroads in the last few weeks. The thirty-two crossings which are to be protected are in Los Angeles, Riverside, Orange and San Bernardino Counties, covering the entire territory in which the Pacific Electric Railway operates.

Passenger Traffic on Subway and Elevated in New York.—The Public Service Commission for the First District of New York has issued a statement of the number of passengers carried on the elevated and subway lines of the city in the year ended June 30, 1915. The total for the subway traffic reached 345,585,749, of which 117,585,390 were northbound and 119,080,397 were southbound. The remaining tickets were sold at the "island" stations and could not be separated into directions traveled. The greatest number of tickets was sold at the Atlantic Avenue station in Brooklyn, with a total of 23,000,000. Grand Central station was second with 20,000,000. The increase in the number of passengers for the year was 5,172,646. The statistics for the elevated roads showed a total number of passengers carried of 301,792,517, of which 120,738,879 were northbound and 114,118,237 southbound. The remainder were sold at "island" stations. The years' traffic showed a decrease of 9,681,051.

Boise Transfer Controversy Settled.—W. E. Pierce, president of the Boise (Idaho) Railroad, has announced the position of his company in the Boise transfer controversy, mentioned in *ELECTRIC RAILWAY JOURNAL* of Sept. 4. Mr. Pierce says his company is willing to enter into an agreement at any time for the exchange of transfers with the Idaho Traction Company. He has instructed his attorney to notify the Supreme Court and the Public Utilities Commission of the position his company has assumed, with a view to obtaining dismissal of the actions begun before these two bodies to compel the companies to enter into an agreement for a system of universal transfers. Since the property of the two concerns was separated on Aug. 2 transfers have been exchanged by the companies, except between the Soldiers' Home line of the Boise Railroad and the Nineteenth Street line of the Idaho Traction Company. The Idaho Traction Company filed answers before both the Supreme Court and the Utilities Commission expressing its willingness to exchange transfers, but neither action was answered by the Boise Railroad until Mr. Pierce made his announcement.

Brooklyn Rapid Transit Reduces the Amount of Time Lost by Employees.—The system of compulsory medical inspection and free attendance for employees excused on account of illness, which was established by the Brooklyn (N. Y.) Rapid Transit Company on Jan. 1, 1913, for approximately 10,000 men in the operating department, accomplished during the year ended June 30, 1915, a reduction in the amount of time lost by the operating employees on account of sickness of 13,485 days (or nearly 18 per cent) over the time lost in the year ended June 30, 1914. The milder winter of 1915 accounted for about 7000 days of the total reduction. Making due allowance for this, however, there still remains a saving of upwards of 6000 days' work for the year, or a reduction of 8.6 per cent over the sickness record of the year ended June 30, 1914. The system of compulsory medical inspection was accompanied in its first year by a reduction of 24 per cent in the number of days' work lost by operating employees on account of illness. This initial record is still being improved upon as the activities of the medical inspection bureau develop. These activities embrace not only the inspection and attendance of operating department employees reporting sick, but free medical attendance for members of the Employees' Benefit Association outside of the operating department; the care of all employees injured in the performance of their duties and entitled to medical attendance under the compensation act; the examination of candidates for employment and the periodic re-examination of all motormen.

Personal Mention

Mr. H. O. Marler has been appointed traveling passenger agent of the Pacific Electric Railway with headquarters at Los Angeles, Cal., vice Mr. E. L. Taylor, resigned.

Mr. Charles Pierce Burton, publicity director of the Gary & Interurban Railroad, Gary, Ind., has just published, through Henry Holt & Company, New York, his seventh volume, "Camp Bob's Hill," a book for boys, having its setting in the sand dunes of northern Indiana. Mr. Burton is the author of a volume of essays and six books for boys.

Mr. P. P. Crafts, formerly manager of the Mobile Light & Railroad Company, Mobile, Ala., has been appointed general manager of the Kanawha Traction & Electric Company, Parkersburg, W. Va. From 1904 to 1914 Mr. Crafts was connected with the Iowa & Illinois Railway, Davenport, Iowa, first as general manager and later as vice-president and general manager. During part of this time he was also in charge of the Davenport & Muscatine Railway. From 1902 to 1904 he was manager of the Saginaw Valley Traction Company. Mr. Crafts entered the public utility field when he was sixteen years old.

Mr. Percy Farrant, who has been appointed to succeed Mr. J. B. Russell as auditor, assistant secretary and assistant treasurer of the Manila Electric Railroad & Light Company, Manila, P. I., has been in the service of the company as assistant auditor continuously since the company began operations in 1905. Mr. Farrant was born in London in 1880, and was graduated from Ryde House College, Surrey, England, in 1896, at the age of sixteen. He immediately thereafter entered the service of John Henderson & Company, London, as a member of their general office staff, and remained in their employ until 1900, when he resigned to join the Colonial Forces. He proceeded to South Africa and served as staff sergeant until the close of the Boer War, at the conclusion of which he was transferred to the public works department, holding the position of chief clerk and accountant. He resigned from the last-named position in 1904 to enter the service of the Argentine Railways as a member of the administration staff and remained in that position until 1905. He then returned to London and was appointed assistant auditor of the Manila Electric Railroad & Light Company.

Mr. J. B. Russell has resigned as auditor, assistant secretary and assistant treasurer of the Manila Electric Railroad & Light Company, Manila, P. I., on account of ill health, and Mr. Percy Farrant, acting auditor, has been appointed to succeed him. Mr. Russell has been in poor health for some time. In May, 1914, he left Manila to seek rest and a change of climate in Japan, and in March, 1915, he left Manila for a six months' vacation trip, taking a long sea voyage to San Francisco, Panama, Trinidad and thence to New York, cabling his resignation from New York. Mr. Russell was born in Glasgow, Scotland, in 1872. At the age of eighteen he left his birthplace to accept a position as a commercial accountant in Trinidad, where he remained for ten years. He left Trinidad for the United States and entered the service of Stone & Webster, first in Boston and subsequently in Tacoma, Wash., with the Tacoma Railway & Power Company. In 1904 Mr. Russell became associated with The J. G. White Companies as auditor while the construction work of the Manila Electric Railroad & Light Company was in progress. Upon completion of the construction work he was appointed auditor, assistant secretary and assistant treasurer of the company. In the early days of the company at Manila Mr. Russell had a difficult task in organizing the forces of the Manila Electric Railroad & Light Company's accounting department, now numbering 143, only six of whom are not Filipinos.

Mr. David A. Belden, who was elected president of the Massachusetts Street Railway Association at the annual meeting on Sept. 8, was born in Aurora, Ill., in 1867. He was educated at Racine College, Racine, Wis., and from 1892 to 1901 was general manager of the Aurora Street Railway, the Aurora & Geneva Street Railway and the Aurora, Yorkville & Morris Street Railway. Mr. Belden then went to Atlanta, Ga., and was general manager of the Georgia Railway & Electric Company until March, 1903,

when he became general manager of the Birmingham Railway, Light & Power Company, Birmingham, Ala. After about four months service in this capacity Mr. Belden was called to the presidency of the railway and lighting properties occupying the districts centering about Haverhill, Mass., and Portsmouth, N. H., with intermediate lines. With headquarters at Haverhill, Mr. Belden is now president of the New Hampshire Electric Railways, the Massachusetts Northeastern Street Railway, the Dover, Somersworth & Rochester Street Railway, the Rockingham County Light & Power Company, and the Kittery (Me.) Electric Light Company. He has maintained unusually good relations with the public in the territory served by his companies, and his work in securing the establishment of a 6-cent fare unit on certain of these lines in proceedings before the Massachusetts Railroad Commission a few years ago was conspicuous for its clarity and set a new standard in the preparation of street railway rate briefs and exhibits at that time.

OBITUARY

John B. Mitchell, a pioneer street railway man of Louisville, Ky., died at his home in New Albany, Ind., recently at the age of eighty-three. He was superintendent of the Louisville Railway for a number of years before electricity was adopted as motive power.

William C. Dunning died at his home in Greenfield, Ind., on Sept. 16, at the age of fifty-three. With Mr. Francis G. Banker he procured a franchise for an interurban line through Rush, Henry, Hancock and Marion Counties, and constructed and operated the road for several years. The property is now a part of the system of the Terre Haute, Indianapolis & Eastern Traction Company.

Cornelius J. Field, who in recent years had been associated with Thomas A. Edison in the development of the Field-Beach battery-operated passenger bus, died at his home in Brooklyn, N. Y., Sept. 20, at the age of fifty-four. Mr. Field was in the early days general manager of the Edison Illuminating Company of Brooklyn, resigning in 1891 to go into electric-railway construction work. Later he went to Europe and the West Indies and built a number of railway lines and industrial plants.

CLEVELAND ELECTRIFICATION PROBLEM DISCUSSED

Following a statement by City Electrician Smith before a special committee of the Council of Cleveland, Ohio, on Sept. 17, to the effect that operation on electrified Eastern roads cost 5 cents per engine-mile, P. T. White, superintendent of the Cleveland division of the Big Four Railroad, declared that the roads would all substitute electric power for steam if this rate could be guaranteed. He said that the cost of operating switch engines is now 35 cents per engine-mile. Mr. White suggested that if the city would build power stations and overhead equipment and guarantee to operate locomotives at a cost not to exceed 5 cents per engine-mile, the railroads would be glad to purchase the locomotives and operate them. According to him the Big Four Railroad could afford to spend \$40,000,000 and pay the interest on the investment if it could secure that rate of cost for operation. Mr. White declared that the figures, of from \$26,000,000 to \$30,000,000, given by former Smoke Inspector E. P. Roberts as the cost of electrifying the roads within the city were wrong. He said that the expense would probably be more nearly double the amount. He proposed to furnish an estimate of the cost of electrifying the Big Four Railroad, and suggested that the city make an appropriation for a careful study of the question. S. D. Robertson, superintendent of the Pennsylvania Lines west of Pittsburgh, notified the committee that he is having estimates prepared.

The utilities committee of the City Council of Seattle, Wash., has voted to recommend the passage over Mayor Gill's veto of the ordinance for the city to enter into a contract with F. M. Petersen, granting him the right to operate a motor-bus line from the northern terminus of Division "A" of the Seattle Municipal Railway to the north limits of Ballard, on a transfer basis.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Cumberland County Electric Company, Bridgeton, N. J.**—Chartered in New Jersey to operate electric railways. Capital stock, \$100,000.

***Charleston-Southern Railway, Darlington, S. C.**—Chartered in South Carolina to construct either a steam or electric railway from Charleston to Hutchinson Island, 86 miles, to connect with the Seaboard Air Line. Headquarters, Darlington. Capital stock, \$43,000. Officers: Bright Williamson, president, and George E. Dargan, secretary, both of Darlington.

FRANCHISES

Anniston, Ala.—The Alabama Power Company has asked the Council for a franchise to construct an extension to the Anniston Country Club.

San Jose, Cal.—The San Jose Railroad has asked the Council for a franchise to construct an extension on Alum Rock Avenue. Bids for this franchise will be received until Oct. 4.

South San Francisco, Cal.—The South San Francisco Railroad & Power Company has received a franchise from the Council to operate a single or double-track electric line over the extension of Grand Avenue to the northeasterly line of the Mission Road, or State highway.

Rockford, Ill.—It is reported that the Elgin & Belvidere Electric Company may ask the Council for a franchise to construct an extension on State Street, Rockford.

Salem, N. J.—The Salem-Pennsgrove Traction Company has asked the Council of Salem for a franchise. It is planned to construct a line between Salem and Pennsgrove. [Sept. 4, '15.]

Kenmore, N. Y.—The International Railway has received a franchise from the Council of Kenmore to double-track part of its main line in Kenmore.

Lancaster, N. Y.—The Buffalo & Depew Railway has asked the Council for a franchise to extend its line, with an additional track, necessary switches, etc., from Ellicott Road and Central Avenue to the New York Central Railroad tracks.

Youngstown, Ohio.—It is reported that the Youngstown & Southern Railway will ask for a twenty-five-year extension of its franchise, with permission to double-track Front Street.

Chester, Pa.—The Council is said to be opposed to the ordinance prepared by the Southern Pennsylvania Traction Company for franchises over additional streets between Chester and Eddystone. One of the city commissioners submitted a plan whereby the company could double-track on certain streets it now uses and use single track over additional streets. The company argued that this method would not relieve the situation. The bill was laid over.

Dallas, Tex.—The Northern Texas Traction Company has filed a petition with the Board of Commissioners of Dallas through the union terminal committee of the Chamber of Commerce asking for a franchise to operate a double-track line on Jefferson Street between the Oak Cliff viaduct and Commerce Street. If the franchise is granted the company agrees to begin immediate construction of the new viaduct over the steam railway tracks entering the new union terminal.

Seattle, Wash.—The Seattle, Snohomish & Everett Railway has asked the Council for a two-year extension of time on its franchise to complete its line between Seattle, Snohomish and Everett. The franchise provides for a line beginning at the present terminus of the Ravenna Park line, extending on Thirty-fifth Avenue, N. E., East Fiftieth Street, East Fifty-fifth Street and other streets in that section of the city. David Swank, Seattle, is interested. (Oct. 18, '13.)

Steilacoom, Wash.—The Tacoma Railway & Power Company has asked the Council for a franchise to construct an extension along the Steilacoom Highway from the end of the present tracks of the Pacific Traction Company, near the Fort Steilacoom Asylum, to the city limits. Chairman Sladen, of the Pierce County Commissioners, states that there will be no opposition to the granting of a franchise and that the petition will be advertised at once and a public hearing held Oct. 1.

TRACK AND ROADWAY

Pacific Electric Railway, Los Angeles, Cal.—This company plans to install thirty-two automatic wigwag warning signals at grade crossings. One is to be installed on the Pasadena Short Line at Schützen Park, one on the Altadena line, one on the Alhambra line, eight on the San Bernardino line and the others on the southern and western divisions. It is expected that the city commission will ask this company to construct a line to Brookside Park, Pasadena.

Municipal Railways of San Francisco, San Francisco, Cal.—The Board of Supervisors have been asked to extend the Union Street line through the Presidio reservation to Fort Winfield Scott.

Tidewater Southern Railway, Stockton, Cal.—It is reported that completion of the line into Turlock is assured by Feb. 1. Material has been delivered and work will be begun at once on the construction of a bridge across the Tuolumne River and grading of the right-of-way will soon be begun from the Turlock end of the line.

Denver & Inter-Mountain Railroad, Denver, Col.—A report from this company states that it is in the market for thirty cattle guards.

Connecticut Company, New Haven, Conn.—Plans are being made by this company to extend its double track on Main Street, East Hartford, north from the corner of Linden Street to the corner of Main and King Streets.

Miami (Fla.) Traction Company.—This company's line in Miami is practically completed. Cars have been ordered and the machinery for generating power and charging the storage batteries has been received. It is expected that operation will be begun by October. B. B. Tatum, president. [May 8, '15.]

Jesup, Ga.—Thomas J. Arline reports that, owing to financial conditions, the project to construct a line between Jesup and Doctortown has been abandoned for the present. [Aug. 1, '14.]

Lula-Homer Railroad, Lula, Ga.—This company reports that 75 per cent of the grading on its proposed line from Belton to Homer has been completed. Surveys are also being made from Homer to Clinesville. The company intends to construct a line from Belton, Ga., to Anderson, S. C., 82 miles. The contract for the construction of track has been let to William J. Redmond, Atlanta, and construction will begin Oct. 1. C. J. Hood, Commerce, Ga., president. [March 20, '15.]

Bloomington & Normal Railway & Light Company, Bloomington, Ill.—New rails throughout will be used on Franklin Avenue, where the track is being removed from the west side to the center of the street.

East Side Electric Railway Company, Centralia, Ill.—S. A. Frazier reports that the project to build an electric railway between Centralia and Irvington has been abandoned. [April 12, '13.]

Mason City & Clear Lake Railroad, Mason City, Iowa.—A report from this company states that it expects to reconstruct 2 miles of track in Clear Lake.

Hutchinson (Kan.) Interurban Railway.—This company reports that it is laying new track on Second Avenue, East, leading from Main Street to Poplar Street, also a wye at Main Street and another entering the Arkansas Valley Interurban Railway's terminal station at Second Street, East. All special work is being supplied by the Elliott Frog & Switch Company and the steel ties by the Carnegie Steel Company.

Iola (Kan.) Electric Railroad.—Plans are being considered by this company for the extension of its lines from Iola to Humboldt.

***Newton, Kansas & Nebraska Railway, Newton, Kan.**—A stock and bond issue of \$1,500,000 for this company has

been approved by the Public Utilities Commission. The new road, which is to be a standard-gage line, will begin at Newton, Kan., and extend north to Albia, near the Nebraska line. The promoters of the road have not decided whether they will build a steam or electric line, but it is to be built through Harvey, Dickinson, Saline, Marion, McPherson, Clay and Washington counties.

Hagerstown & Frederick Railway, Frederick, Md.—Citizens of Emmitsburg have asked this company to build an extension of its lines from Thurmont to Emmitsburg, 7 miles.

Boston (Mass.) Elevated Railway.—A petition signed by West Roxbury citizens has been filed with the Public Service Commission asking for the restoration of the surface car line between Jamaica Plain and the North Station.

Springfield (Mass.) Street Railway.—This company plans to relocate its tracks in Springfield between the North End bridge and the Plainfield Street bridge. The relocation of tracks and removal of poles and wires will cost the company about \$20,000.

Armada, Mich.—Work has been begun on the construction of an electric line from Armada to Detroit via Ray, Davis, Macomb and Fraser. The line will enter Detroit on Mack Avenue. Mount Clemens, through which it was at first planned to extend the road, refused to grant the company a franchise for the use of its main streets. Peter Jacobson, Detroit, is interested. [Aug. 7, '15.]

Joplin & Pittsburgh Railway, Kansas City, Mo.—It is reported that J. J. Heim and associates of Kansas City, who own the Joplin & Pittsburgh Railway, are considering the purchase of the Joplin-Parsons line of the Missouri, Oklahoma & Texas Railroad, with the object of converting the road into an electric line. It is said negotiations have been opened and that the prospective purchasers are planning an early visit to Parsons to confer with officials of the Missouri, Oklahoma & Texas Railroad. The purchase seems to be contingent upon the willingness of the city of Parsons to help defray the expenses of building the railroad from Cherokee Junction to Parsons, 5 miles, in order that the line may enter the city of Parsons at a desirable point.

Metropolitan Street Railway, Kansas City, Mo.—The receivers of the Metropolitan Street Railway have awarded a contract to the Columbia Construction Company, Milwaukee, for the building of all new railway extensions required at this time by the terms of the new contract. Work will be begun at once by this company. There are 10 miles of these extensions.

***St. Louis Subway & Elevated Corporation, St. Louis, Mo.**—This company is being organized to construct 4.76 miles of elevated railway and 3.29 miles of subway in St. Louis. The road would connect with interurban railways at the city limits. James D. Houseman and F. E. Niesen, Bank of Commerce Building, St. Louis, are interested.

Manchester (N. H.) Street Railway.—Plans are being made for the construction of a bridge at South Elm Street, Manchester, at a cost of about \$76,000, of which \$40,000 will be paid by the city of Manchester, \$24,000 by the Boston & Maine Railroad and \$12,000 by the Manchester Street Railway.

Salem-Pennsgrove Traction Company, Salem, N. J.—This company has asked the county of Salem to construct a new bridge at Penn's Neck. The bridge will cost approximately \$30,000 and the company offers to pay half of this sum. It also offers to pay for strengthening the Lower Canal bridge. Rights-of-way have been received from three-fourths of the property owners along the route of this company's proposed line. [Sept. 4, '15.]

Brooklyn (N. Y.) Rapid Transit Company.—Official announcement has been made by the Brooklyn Rapid Transit Company that on Sept. 25 the company will begin operating trains over the Liberty Avenue extension of the new dual subway system improvements. The extension will carry the Fulton Street elevated road, which is being third-tracked to afford express service, from the borough line between Brooklyn and Queens to Lefferts Avenue, Richmond Hill, thus adding many miles of territory to the 5-cent-fare zone. Sections which the new route will serve include Woodhaven, Clarenceville, Morris Park and Richmond Hill.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The Public Service Commission for the First District of New York has authorized the New York Municipal Railway Corporation to award the contract for furnishing structural steel for the third-tracking of the Myrtle Avenue elevated railroad between Broadway and Wyckoff Avenue, Brooklyn, to the Phoenix Bridge Company, the lowest bidder, for \$40.50 per net ton.

International Railway, Buffalo, N. Y.—A comprehensive plan of this company for the construction of the new Bailey Avenue line is soon to be laid before the Council. It calls for the construction of a line between Sycamore and William Streets in 1916, between William and Seneca Streets in 1917, between Sycamore and Ferry Streets in 1918 and East Ferry Street and Kensington Avenue in 1919. Approval of the four-year period for the development of this new double-track line is asked by the company. The entire distance is 3 miles.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—Construction has been begun by this company on a loop line on Seventeenth Street from State Street to Peach Street, Erie. The company is completing a double-track system on East Sixth Street.

Cleveland (Ohio) Railway.—The double track on Euclid Avenue between East Twenty-second and East Fortieth Streets is now about complete and cars were scheduled to be in operation on it on Sept. 20. Residents of Prospect Avenue, between the same streets, where Euclid Avenue cars have always run before are to have a shuttle service until Wade Park Avenue cars, now routed over Superior Avenue because of sewer work on East Sixty-fifth Street, again begin operation over that line. A single track will shortly be constructed on Mumford Court between East Fifty-fifth Street and Broadway to make a loop for some of the Fifty-fifth Street cars. Because of much heavier traffic on the northern end of the line than the southern end it has become necessary to turn some of the cars at this point.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—Final surveys are being made of this company's proposed line to connect Columbus, Galena, Baxter Springs, Miami, Centralia, Collinsville and Tulsa. Construction will be begun as soon as several details of right-of-way are settled. John R. Rose, Oklahoma City, president. [Aug. 28, '15.]

Toronto (Ont.) Civic Railway.—Concrete is now being laid under the double tracks on Bloor Street, west of Dundas Street for the new civic car line. Excavation work was done, and two lines of track put down in the center of the roadway as far west as Indian Grove. This portion will be completed before any more track is laid. The present car line is operated on a temporary single track on the north side of the street. Ratepayers of the southern portion of the ward want the line extended north on Quebec Avenue or Pacific Avenue to Annette Street and Jane Street.

Philadelphia, Pa.—Bids will be opened on Oct. 19 for about 25,000 tons of steel for four sections of the proposed Frankford elevated line as follows: Contract 511, Front Street from Callowhill Street to south of Girard Avenue, about 4074 ft. of structure; contract 512, Front Street and Kensington Avenue from south of Girard Avenue to north of York Street, about 7128 ft.; contract 513, Kensington Avenue from north of York Street to North of Ontario Street, about 7769 ft.; contract 514, Kensington and Frankford Avenues from north of Ontario Street and south of Unity Street, Frankford, about 7653 ft. A subway will be built from League Island to Olney and Rising Sun Avenues and an elevated railway from Front and Arch Streets to Bridge Street, Frankford. A subway-elevated line to Roxborough and an elevated railway from Thirtieth and Market Streets to Darby will eventually be built. Work has been begun by James D. Dorney on the Frankford elevated line, and the Keystone Construction Company has begun the first excavation for the Broad Street subway. The total cost of the lines recommended for immediate construction has been approximated at \$46,000,000, with an additional \$12,000,000 for equipment. A. M. Taylor, director of city transit, is in charge of the work. [Aug. 28, '15.]

Stroudsburg (Pa.) Passenger Railway.—This company reports that it is rebuilding 1 mile of track on Main Street, Stroudsburg.

Rhode Island Company, Providence, R. I.—Work has been begun by this company reconstructing its tracks on Clinton Street, Woonsocket, with 9-in. grooved girder rails.

Greenville Railway & Light Company, Greenville, Tex.—Wesley College has acquired this company's line to the college with the right to operate over the railway from the intersection of the Mineral Heights track to the northwest corner of the square. A car has been purchased by the college and will be placed in operation at once. The track will be repaired and placed in good condition.

Houston, Richmond & Western Traction Company, Houston, Tex.—A meeting was held in Gonzales to consider the proposition of constructing this company's proposed railway between San Antonio and Houston through Gonzales. A committee was appointed to solicit subscriptions and right-of-way through the county. E. Kennedy, president. [Sept. 4, '15.]

Temple & Marlin Interurban Railway, Temple, Tex.—It is reported that construction will soon be begun on the proposed line from Temple to Marlin, about 30 miles. S. D. Hanna, Temple, chief engineer. [Feb. 7, '14.]

Salt Lake & Ogden Railway, Salt Lake City, Utah.—This company reports that it is laying 3 miles of second track between Orchard and Clinton, thus making double track from Ogden to Clinton.

Richmond, Rappahannock & Northern Railway, Richmond, Va.—Surveys have been completed for this company's proposed line from West Point to Urbanna and construction will soon be begun. Warner Moore, president. [Aug. 28, '15.]

Fayette, W. Va.—Surveys have been begun for the proposed electric railway from Fayette Station to Beckley, 35 miles. H. G. Scott, general manager Virginian Power Company, Charleston, W. Va., is interested. [June 12, '15.]

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—This company has presented plans to the Board of Public Utilities for remodeling Hill Street station and trackage. It is estimated that the cost will be about \$30,000.

Aurora, Elgin & Chicago Railroad, Wheaton, Ill.—The new terminal building of this company at Main Street and Broadway, Aurora, has been opened. The South Broadway transfer station will be discontinued and all transferring between interurban cars and between interurban and city cars will be done at the new station. The general offices of the company have been moved from Wheaton to the sixth floor of the building. The second, third, fourth and fifth floors have been sublet by the company as office suites.

Union Traction Company, Coffeyville, Kan.—This company has awarded a contract to Clements & Lavery for the construction of a terminal building in Coffeyville. The structure will be 96 ft. x 143 ft., two stories high. The building will be of brick and steel and will cost about \$40,000.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The Public Service Commission has approved this company's application for a rearrangement of stations on the Myrtle Avenue elevated line between Broadway and Wyckoff Avenue. The stations as rearranged will be Central Avenue, Knickerbocker Avenue and Wyckoff Avenue.

Ogden, Logan & Idaho Electric Railway, Ogden, Utah.—It is reported that this company plans to move its street railway and interurban carhouse and shops from their present location on Washington Avenue to a new site at the old fair grounds on West Seventeenth Street.

POWER HOUSES AND SUBSTATIONS

Bartlesville (Okla.) Interurban Railway.—This company reports that it is installing a new Westinghouse-Leblanc jet condenser with motor-driven pumps to replace a condenser with turbine-driven pumps. The company is also resetting three 400-hp. Babcock & Wilcox boilers and installing a complete new system of steam piping.

Manufactures and Supplies

ROLLING STOCK

Boise (Idaho) Railroad, W. E. Pierce, president, has made arrangements for the purchase of five new cars.

Wilmington & Philadelphia Traction Company, Wilmington, Del., is about to place an order for twenty-five new cars.

Florida-East Coast Railway, St. Augustine, Fla., has ordered a gasoline electric car from the General Electric Company.

Lula-Homer Railroad, Lula, Ga., a line under construction, is considering the purchase of storage-battery locomotives for operating its new road. D. G. Zeigler is chief engineer.

Brooklyn Rapid Transit Company, New York, N. Y., noted in the *ELECTRIC RAILWAY JOURNAL* of May 22 as preparing designs for an experimental articulated center-entrance car, has ordered the center section of this equipment from the Laconia Car Company. This railway company is now rebuilding two of its single-truck car bodies in its Fresh Pond shops preparatory to attaching them to the center section.

Toronto (Ont.) Civic Railway, noted in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11 as having ordered four semi-convertible prepayment cars from the Preston Car & Coach Company, has specified the following details for this equipment:

Length of body.....	21 ft.	Guards.....	H. B.
Length over vestibule,		Gears and pinions..	tool steel
34 ft. 8½ in.		Gongs	Preston
Width over sills..	8 ft. 5½ in.	Hand Brakes.....	Peacock
Width over all..	8 ft. 5¾ in.	Heaters,	
Height, rail to sills..	2 ft. 6 in.	Consol., coal burning	
Height, sill to trolley base,		Headlights,	
8 ft. 4 in.		Crouse-Hinds "Z"	
Body.....	wood, steel frame	Motors..	2 GE-80, inside hung
Interior trim.....	oak	Paint	Sherwin-Williams
Roof	arch	Sanders	Preston
Underframe	metal	Sash fixtures.....	Preston
Axles.....	Jones & Laughlin	Seats	Preston
Bumpers	Hedley	Seating material.....	wood
Buzzer system.....	Consol.	Springs	Brill
Control	K-10	Trolley-base	McRae
Curtain fixtures,		Trucks.....	Brill 21-E
Curtain Supply Co.		Varnish	Murphy
Curtain material..	Pantasote	Ventilators	Automatic
Destination signs,		Wheels,	
Keystone, four per car		Dominion Wheel & Foundry	
Fare boxes.....	Coleman		

TRADE NOTES

John P. Jay, Jr., vice-president of the Pennsylvania Steel Company, has resigned from that company to become chairman of the board of the Maxwell Motor Company.

United States Electric Signal Company, West Newton, Mass., has received an order from the Massachusetts Consolidated Railways, Greenfield, Mass., for two complete blocks of its Type K registering signals.

Pennsylvania Steel Company, Steelton, Pa., has appointed R. W. Gillespie as general sales manager, with headquarters in Philadelphia. Mr. Gillespie succeeds John C. Jay, Jr., recently resigned. Mr. Gillespie has been identified with this company for many years and for the past several years has been the company's district sales manager in New York.

Electric Service Supplies Company, Philadelphia, Pa., has received an order from the Chicago, Milwaukee & St. Paul Railway for 20,000 "protected" rail bonds, type P-4-P, 250,000 circ. mil capacity, 37 in. long. This is in addition to orders for 25,000 similar bonds placed with this company last May, thus making a total of 45,000 "protected" rail bonds that will be used in this important electrification.

C. L. Oechsner, publicity manager of the British Thomson-Houston Company, Ltd., Rugby, England, who was for many years with the Thomson-Houston Company at Lynn

and with the General Electric Company at Schenectady, is on an extended visit to this country. He is planning, before he leaves, to visit the San Francisco exposition. His address, while in this country, will be in care of the *Electrical World*, New York.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has declared a quarterly dividend of 1½ per cent on the common stock, an increase of half of 1 per cent quarterly. This places the stock on a 6 per cent basis. The regular 1¼ per cent quarterly dividend was declared on the preferred stock. The following statement regarding war orders was issued after the meeting of directors: "The company has received firm contracts for the manufacture of war munitions aggregating approximately \$60,000,000, the greater proportion of which is a contract for rifles which is to be executed at factories in New England especially acquired for that purpose."

William E. Keily, recently associate editor of the *Electrical World*, has opened an office in the Edison Building, 72 West Adams Street, Chicago. For nearly a year past Mr. Keily has been engaged in literary and consulting work having to do with public-utility problems and relations, and he will continue work of this character, with improved facilities, in his new office. An experienced writing man, Mr. Keily has done journalistic work in both daily newspaper and technical magazine fields. For a number of years he was managing editor of the old *Western Electrician* of Chicago. Mr. Keily is an associate of the American Institute of Electrical Engineers, a class B member of the National Electric Light Association, and a member of the Jovian Order, Electric Club-Jovian League of Chicago, National Geographic Society, and the City Club of Chicago.

ADVERTISING LITERATURE

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a list of its second-hand car equipment and railway supplies.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued sheets describing the operation of its Type C controllers for crane service.

NEW PUBLICATIONS

Single-Phase Electric Railways. By Edwin Austin, of the editorial staff of *The Engineer*, London, published by D. Van Nostrand Company, New York. 303 pages. Cloth, \$5 net.

This is a well-illustrated volume of careful descriptions of many single-phase railways, based for the most part upon articles which have appeared in the periodical with which the writer is associated. There are eleven chapters. The first contains a brief for the single-phase railway, which the author states "should be adopted whenever there is a possibility of running heavy electric trains long distances." Each of the other chapters is taken up with descriptions of one or more systems in one country. The list, which will be valuable for reference, is as follows: England, London, Brighton & South Coast Railway and Midland Railway; France, Midi Railway; Germany, Blankenese-Hamburg-Ohlsdorf Railway, Dessau-Bitterfeld Railway, Murnau-Oberammergau Railway, Mittenwald Railway; Austria, St. Polten-Mariazell Railway; Switzerland, Martigny-Orsières Railway, Valle-Maggia Railway, Rhaetian Railway and Lötschberg-Simplon Railway; Holland, Rotterdam-Scheveningen Railway; Norway, Thamshavn-Lokken Railway and Rjukan Railway; Sweden, Swedish State Railways; Italy, Parma Tramways; United States, New York, New Haven & Hartford Railway, New York, Westchester & Boston Railway, Spokane & Inland Empire Railway, Rock Island & Southern Railway, Hoosac Tunnel Railway and St. Clair Tunnel Railway.

Obviously the book contains a wealth of information of a general nature. It does not take up single-phase motors except as a part of the descriptions, and it does not summarize the essential features of the subject. As the author states, progress in this field has been so rapid that he had to stop at some point, and hence was unable to add a description of the new Norfolk & Western electrification in this country.

Vol. XLVI

NEW YORK, SATURDAY, OCTOBER 2, 1915

No. 14

STANDARDS IN CAR DESIGN

The communication signed by "Car Builder" which appears on another page of this issue, raises several interesting and logical points in connection with Mr. Gonzenbach's recent appeal for standardization as a means for reducing the cost of electric railway cars. All of the writer's comments contain food for thought, but it is, perhaps, unfortunate that he should have cited, as a reason for preventing the establishment of standards, the fact that a great number of radical innovations in car design have been introduced during the past three years. Certainly these widely different designs possess individual points of great merit, and certainly none of them will ever become a universal standard. But this is by no means an argument against standardization. Would the Hedley-Doyle car be any worse if its side-post spacing were changed by the fraction of an inch necessary to make it correspond with that of the Jones car or the Brinckerhoff car or any of the special types mentioned by our correspondent? And would the Birney design be fatally handicapped if a roof contour were imposed upon it similar to that on the car which proudly bears the name of "Peatwit"? We cannot conceive that it would. Of course, it is a long cry from standardization in details to a single universally-standard body. Yet the former is certainly possible to-day, and if the car builders really want uniformity, as our correspondent says, they can make an initial step toward it by the simple process of standardizing a few details and encouraging their establishment by charging less, even if it is only \$5 per car, whenever they are used.

PRESENTING DATA IN WAGE ARBITRATIONS

A noticeable feature of recent arbitration hearings has been the use of charts for impressing data upon the minds of the arbitrators. An example of such use was furnished by the Bay State Street Railway arbitration. Charts used in these hearings were reproduced on page 708 of the issue of the ELECTRIC RAILWAY JOURNAL for April 10, 1915. We have been fortunate in securing copies of a number of the exhibits used in connection with Prof. A. S. Richey's testimony, referred to on page 645 of last week's issue. These are reproduced herewith, on page 664. The charts are self-explanatory and they contain data well worthy of study. One chart which proved very effective at the hearing was that showing the rapid increase of wages of conductors and motormen with an actual decrease in the work of each man as indicated by the number of passengers carried per car-hour and the corresponding revenue. Another was that giving a comparison of the

wages paid on the Rhode Island system, expressed in various ways, with the union wages paid in other trades, using data for the latter taken from government bulletins. This chart also compared the above with the cost of living made up from components shown on a third chart. The use and publication of data like these must have a cumulative value and effect. If the general public and the employees are convinced of the accuracy of the data they can have no reasonable justification for obviously excessive demands. Professor Richey and other students of economic conditions who present the results of their investigations in such convincing fashion deserve the thanks of both parties concerned in wage controversies.

RAILWAY PAPERS AT INTERNA- TIONAL CONGRESS

The intimate relations of electric railroading to all branches of engineering is shown very conspicuously by the appearance of papers on electric railways in nearly all of the sections at the International Engineering Congress recently closed. Thus the important papers on London traffic by Sir Albert Stanley and on utilities by Dr. Humphreys, not to mention others, were assigned to the section of municipal engineering. The railway engineering section included the paper on track construction by George H. Pegram, chief engineer of the Interborough Rapid Transit Company of New York, and the papers on heavy electric traction by Messrs. McHenry and Hood. In the same way, the papers on motor vehicles and on power station design, with the exception of that by Dr. Parshall, were assigned to the mechanical engineering section, while that paper and the one by Mr. Eaton on the mechanical problems of the electric locomotive were put in the electrical engineering section. Finally, the electric railway engineer who is interested in the chemistry of rails and of special work must search for the matters which interest him in the metallurgy section. The consequence is that the papers on electric railway engineering, like the electric railway exhibits at the fair, are scattered by being placed in some half a dozen or more different places, and their value in a sense is somewhat lost by this plan. We hope that at the next International Engineering Congress the precedent established at the Turin International Engineering Congress will be followed by the establishment of a special electric traction section, and that at the next international exposition the importance of the electric traction industry will be recognized by the collection of the electric railway exhibits in one building instead of being distributed among several. Surely the industry is of sufficient importance to warrant this.

THE HEALING POWER OF PUBLICITY

Rousseau once made the pessimistic remark that the pain from the prick of the rose thorn more than counteracts the pleasures of a thousand rose smells. Unfortunately the same principle is applicable to the easily irritated patrons of the electric railway, but with care and good judgment the situation can often be met in a way to justify another remark that the removal of one thorn from the flesh often makes the other thorns seem like roses. This latter mental phenomenon was recently illustrated in Pennsylvania, where a certain local railway company was receiving from its riders an unusual number of criticisms of various kinds, but among them complaints about flat wheels and infrequent service were perhaps most pronounced. The manager realized it was important to do something, so he remedied the first complaint and turned or ground all of the flat wheels. As soon as this work was done the railway issued special announcements calling attention to the improvement in equipment effected. This frank publicity not only won ready appreciation from the public but such was its effect that frequent comments were now overheard regarding the general improvements which the company was providing, although no other betterment had actually been made at that time. Of course, if the character of service had continued to be poor the effect of the mental cocaine of satisfaction administered the public by the one improvement would soon have worn off. We do not recite the above illustration, therefore, in order to suggest a cloak for half-hearted or incomplete practices but to show an example of the general mental healing power of publicity when applied at the right psychological opportunity.

5000-VOLT DIRECT CURRENT

In this issue is recorded another step, one might almost say jump, in the climb of voltages for d.c. railway equipment. The Michigan United Traction Company, already famous for its pioneer work in electric railway engineering, stands sponsor for a 5000-volt installation on one of its lines. At present the equipment is considered to be hardly clear of the experimental stage, as emphasized by N. W. Storer in his description of the motors and control which we publish elsewhere. But judging from the astonishing results obtained on the 2400-volt Butte, Anaconda & Pacific installation which was regarded hardly two years ago with considerable trepidation on account of the high voltage, this qualification may perhaps be due to super-modesty on the part of those who have made such a notable advance. In so far as concerns the voltages impressed upon the motor commutators there is nothing startling to be found—a characterization that, however, by no means applies to the design—because the line emf. is split up by permanently coupling the four motors in pairs, and in addition, building each motor with twin armatures in series. Thus across each commutator there are normally but 1250 volts. As a whole the equipment is a marvel of ingenuity in the application of familiar principles. Among the most interesting elements are the double-break switches with

chilling pieces to kill the arcs, the storage battery charged from the ground side of the circuit which supplies the auxiliaries and thus eliminates the frequently-troublesome motor generator set, and last but by no means least the mercury vapor converter by means of which the three-phase power is transformed to the d.c. form. As the rectifier has unquestionably had considerable influence in making the 5000-volt equipment a commercially attractive proposition the disclosure of its remaining weaknesses and peculiarities, which must necessarily follow its use in such a conspicuous installation, will be awaited with interest.

METHODS OF CHECKING SERVICE

In close connection with the series of articles by F. W. Doolittle on the general subject of traffic surveys, recently appearing in this paper, lies the question of selecting the proper method for checking the measure of service. Obviously it is not easy to formulate a detailed plan applicable to all traffic checks, for in some cases the controlling factors can be easily located and sufficient information obtained from a single check to determine whether the transportation is satisfactory, while in others the question of the extent of service cannot be answered without an examination at many points determined by local conditions. In regard to the service checks for any particular city, however, the difficulty of establishing a general yet definite rule does not seem insuperable. It should be possible to determine the approximate number and general character of strategic points that would be adequate for checking the service as well as the duration of the checking operations. Any rule that is drafted along this line, however, should state definitely only the main provisions of the checking method, and latitude should be allowed for the accidental variations, both in service and in the location of strategic points, that are certain to be effected by the seasons and by changes in routes.

In general, there are three checking methods—by points, by routes, and by groups (the comparative efficiency of using stationary or riding observers not being herein considered). All are useful and sometimes all may be necessary, depending upon the character of the service rendered and the investigation to be made. Checks at points are made only at particular points where the traffic has seemed to be unusually congested. For such a study they are valuable, but obviously such checks are not a measure of the service of the whole street or route. Checks by routes are made at several controlling points, either on lines served by only one route or on a trunk line served by several routes, the purpose being to determine the adequacy of service on the one or on each separate route. The chief function of route checks is in connection with streets covered by only one route, and the real problem arises when one tries to adapt this method of checking to trunk-line service. In most cities of considerable size certain streets in the downtown districts are traversed by several lines, which enter the trunk line at one or various points and run on it for varying distances. Such a

service would seem to require the group plan of checking, which is also made at several controlling points but measures the number and loading of all cars, regardless of route, that run over the common track.

Those who favor a combination of route checks in measuring such composite service take the point of view that if the various routes operating over the trunk line are checked separately and are found to be furnishing satisfactory service on that line, it is a reasonable inference that all the routes together are furnishing sufficient trunk-line service. The existence of any short-haul traffic which both originates and terminates on the trunk line between the points where the lines branch is believed to be reflected in the ratio of seats to passengers on the several routes. It is true that in most cases not much traffic drops off the route lines, but to the extent that it does the amount of such purely trunk-line traffic is not shown by the route checks. Furthermore, the route checks on the trunk line fail to take into account the transfer of passengers between routes when the turn-off points are reached. On the other hand, if a group check is made on a trunk line, an accurate measure of the traffic, both long-haul and short-haul, on this line is secured, but no accurate data are obtained for dividing the trunk-line service among the several routes so as to satisfy the route services beyond the points of divergence.

For these reasons neither the route nor the group method seems self-sufficient in checking composite service. We believe that the logical plan is to check by the group method at the controlling points the combined loadings of all cars that serve the trunk line, irrespective of their routes. This gives a measure of the total trunk-line service needed. To determine the proper division of this service, however, route checks should be made on each route at its controlling points beyond its turn-off from the trunk line. When the trunk-line continues past the turn-off point of one route line instead of splitting up into several routes, a check should also be made on the trunk line beyond the point of divergence in order to ascertain whether the service offered has been decreased in the same proportion as the number of passengers. If the combined services of the routes, thus determined, fail to satisfy the trunk-line service as established by the group method, the existence of a short-haul trunk-line service is proved. In such a case a special shuttle service could be installed on the trunk line to handle this short-haul traffic, whereas without the route-method figures the service on one of the long contributing lines might be increased, at much greater cost, to make up the deficiency. In short, the combination of the two methods permits the recognition of transfer passengers at the points of divergence, a division of the service on a trunk line between it and a diverging route or among diverging routes so as not to lower the seat ratio on any line, and the ascertainment of the amount of short-haul trunk-line traffic, which, once known, can be handled efficiently.

The greatest difficulty in using the group method of checking composite service seems to be the deter-

mination of what part of any trunk-line street must be covered by a route before that route can be considered as supplying part of the trunk-line service. This question recently arose in Chicago, the objection being raised that some route cars would turn off the trunk line before they had passed all the checking points. Some argued that cars should be required to run over two-thirds of the trunk-line mileage checked before they would be considered as giving trunk-line service. It was asserted that this arbitrary provision was proper in the case of Chicago because most of the route lines in that city cover this distance before they branch off, but it would undoubtedly be an unwise precedent for other cities. In our opinion, if the distance which any car runs on the trunk line is greater than the distance which the average passenger will walk in preference to taking a car, say from a quarter to half a mile, that car unquestionably adds to the service on the street and should be considered in a group check.

THE BAY STATE EQUIPMENT DEPARTMENT

Elsewhere in this issue is described the organization of the equipment department of the 1000-mile Bay State Street Railway. This organization is represented graphically by an effective form of organization chart which is easy to produce and easy to read. A noticeable feature of this organization is the concentration into the hands of the superintendent of equipment of a variety of duties that are usually divided among subordinate or sub-department heads and the unusually high proportion of the working time of foremen to their supervising time. In studying this organization it should be remembered that the Bay State Street Railway not only spreads over an enormous area but that the city of Boston breaks it up into two physically unconnected groups of lines north and south of Boston. Therefore, to maintain efficient supervision, the superintendent of equipment must spend a large part of his time in traveling over the property. Fortunately, the automobile is available to bring such supervising time down to a minimum.

The physical separation of the Bay State lines explains in large measure the dual character of the departmental family tree, but over and above this, the organization is singularly flexible in its provision for the performance of special services by men peculiarly qualified for particular tasks. Here is no excessive adherence to symmetry of organization for its own sake, but rather an arrangement of staff responsibility which confers upon some subordinate officer duties which in some measure are his alone. At the same time a wide gap exists between the head of the department and his staff, for unlike other mechanical departments he has no sub-departmental heads like an engineer of car construction, of electrical equipment, of maintenance, of structures, etc., but must handle these duties alone. That such arrangement has worked out well on this large property is a compliment to the executive ability shown in directing the numerous activities of the equipment department from design to maintenance.

Operating with 5000-Volt Direct Current

The Michigan United Traction Company Has Placed in Service, on Its Jackson-Grass Lake Line, Motors with Two 2400-Volt Armatures Mounted in One Frame and Connected in Series, Power Being Drawn from a Trolley Supplied by Mercury-Arc Rectifiers

BY N. W. STORER, GENERAL ENGINEER WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

Ten years ago a proposal to equip an interurban car with motors and control apparatus to operate from a 5000-volt direct-current trolley would have fallen on deaf ears. No one would for one moment have considered such a proposition seriously. But to-day such a car is in daily service and as the equipment has experienced several months of actual service, it is permissible to give a description of the principal features. The equipment was designed and built by the Westinghouse Electric & Manufacturing Company primarily for the purpose of determining, if possible, the practicable limit to which voltages for direct-current railways could be carried. Five thousand volts was selected as the initial limit, as this is high enough to make easily possible the collection of current for the largest locomotive from an overhead wire. It is also high enough to lessen the amount of line copper and the number of substations, and to secure a good load factor and efficiency with reasonable cost.

The initial experiments involved the design and construction of two 2400-volt motors and the necessary control equipment, which were mounted on a car and tested on the interworks railway at East Pittsburgh in the spring of 1914. The equipment was first arranged for series-parallel control with voltages of from 2400 to 3000 on the trolley. Then the two motors were connected permanently in series and the equipment operated at a trolley voltage of 4000, which was gradually increased until the equipment was finally tested with 7000 volts on the trolley.

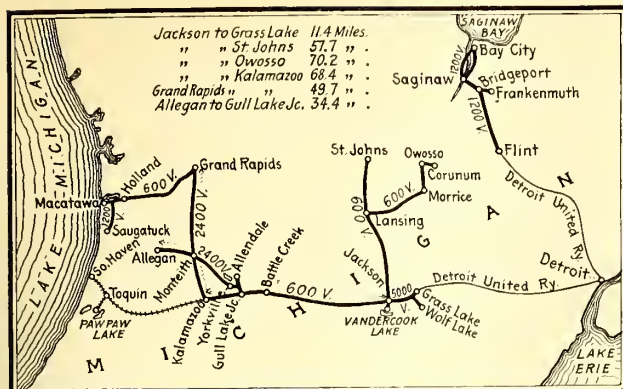

The results were such that the company decided to place a complete four-motor equipment in service. Through the influence of the late W. A. Foote and Frank Silliman, who are well-known pioneers in the

use of high voltages both for transmission and for traction purposes, J. F. Collins, vice-president of the Michigan United Traction Company, agreed to co-operate with the Westinghouse Company in the test, and he offered the use of a branch line extending from Jackson, Mich., to Grass Lake and Wolf Lake for the purpose of giving the equipment a test in service. This line is about 12 miles in length and the high-voltage section extends to Page Avenue, which is about 2 miles from the center of Jackson. The car must, therefore, operate over the 600-volt line within the city limits. The trolley line was reinsulated and space was allotted in the substation at Grass Lake for a mercury-arc rectifier equipment which was installed to furnish high-voltage current. A complete car equipment, consisting of four 100-hp. motors with control and auxiliaries, was installed under the direction of R. C. Taylor, superintendent of equipment, on one of the Michigan United cars, the completed car weighing approximately 40 tons.

On June 1 of this year preliminary tests were begun after the regular service had been completed for the day. They continued for a few nights until it was certain the equipment was in proper condition, and the car was then put in daily service for the last two or three round trips between Jackson and the Lakes, which could be handled by a single car. Since that time the operation has been fairly regular for these trips, and up to date it has continued without a single interruption to the service due to the car equipment. It has not been necessary to change any detail in the equipment since service began, and the car has always been ready for operation when line and power were available. Considering the radical increase in voltage over

5000-VOLT D.C. EQUIPMENT—CARS AND OVERHEAD CONSTRUCTION ON GRASS LAKE (MICH.) LINE

5000-VOLT D.C. EQUIPMENT—MAP SHOWING VOLTAGE AND MILEAGE OF MICHIGAN UNITED RAILROAD LINES

5000-VOLT D.C. EQUIPMENT—COMPARISON OF STANDARD MOTOR AND 5000-VOLT MOTOR

anything previously undertaken and the small size of the motors, this result is remarkable.

MOTORS

Of course, the most difficult part of the equipment would appear to be the motors. It is well understood that, in order to secure the maximum benefits from electrification, a railway must be able to operate not only locomotives but multiple-unit car service. Consequently, any system of electrification that hopes for recognition for heavy traction purposes must be suitable for operation on passenger cars. It is not so difficult to secure space for the necessary number of commutator bars and the creepage surface for insulating large locomotive motors for high voltages, but it has been a serious problem to secure these requisites for a motor of the size required for ordinary interurban cars without exceeding commercial limits for weight, cost and dimensions. For that reason the design of the motor was undertaken first as being the most difficult. One of the first of these is shown in the accompanying illustrations. This motor, it may be said, is on exhibition at the Panama-Pacific Exposition. The arrangement of parts is shown in section in the cut at the top of the next column.

The motor is known as the twin-armature bi-polar type and it has many advantageous features for high voltage work. A bi-polar design permits the use of double the voltage on a given commutator that is possible with a four-pole motor. The twin armatures make the weight but little more than that of a corresponding four-pole motor. Fewer field coils are required than

are used with the four-pole motor, and the two armatures, being geared to the same axle, act as one unit and cut the pressure on the gear teeth in half. The two armatures are connected in series, and consequently, the voltage on each is reduced to lower limits. The form of motor lends itself readily to a very effective type of insulation, and the mechanical construction is simple and rugged.

The performance of the motors has thus far been all that one could ask. There has yet to appear the first defect in any motor that has been built. The commutation is sparkless, and the stability of the motor, as shown by its absolute freedom from flashing, is perfect. Large creepage surfaces are supplied, both on armatures and brush-holders, in order to give immunity from grounds. One characteristic that will assist in the maintenance of the insulation is the fact that the current is small, being only 30 amp. for each 100-hp. motor, and that only a few small brushes are required. Thus with the excellent commutation, there is very little wear either on brushes or commutators, and consequently the amount of carbon and copper dust originating in the motor is small. It is fully recognized that upon the permanence of the insulation depends the success or failure of the experiment, and this is something that time alone can determine.

CONTROL

Next to the motors, the control is the most important feature of the equipment, since the switches must close and open the high-voltage circuits properly and must be insulated to stand continuously the maximum

5000-VOLT D.C. EQUIPMENT—FRONT AND REAR VIEWS OF TWIN MOTOR

voltage to ground in all kinds of weather. In order to secure a relatively large number of breaks in series without increasing the number of switches unduly, each switch is made with two breaks in series.

High-Voltage Switches—The switches are very similar to the standard Westinghouse electro-pneumatic switches, but have some special features, due to the small current and high voltage. The main ideas governing the design of the switch group were safety and reliability in opening the high-voltage circuits and most effective distribution of insulation. The design adopted has both of these desirable features and, in addition, is extremely simple and rugged. The frames of the switch group are grounded and the interlock wiring is thoroughly protected, in order to isolate the high-voltage current from the control wiring and master controller. One of the novel features in the switch is the use of an "arc splitter," consisting of a piece of soapstone placed in front of the switch jaws in the path of the arc. The effect of the magnetic field is to blow the arc against this along its entire length until the arc is broken. This greatly increases the length and at the same time chills the arc, and the result is highly satisfactory. The operation of the switch groups has been fully as reliable as that of the motors. The circuits are opened

5000-VOLT D.C. EQUIPMENT—SWITCH GROUP WITH COVER REMOVED

with ease and the appearance of the switches shows scarcely a trace of their having been in service.

Starting Resistance—Practically the only other part of the control equipment that is subject to the line voltage is the starting rheostat. This is composed of cast alloy grids in a number of frames. These frames are insulated from ground by triple insulation and from each other by double or quadruple insulation. This insulation has thus far proved entirely adequate.

Changeover Apparatus—Inasmuch as the equipment is required to operate through the city of Jackson on 600 volts, a changeover switch is provided which connects the four sets of armatures in parallel. This apparatus consists of two triple-pole, double-throw disconnecting switches with the contacts mounted on porcelain insulators immersed in oil. They are connected together so that they are operated by a single lever, which also operates a small drum that changes a few of the contactor magnet connections.

Low Voltage Switch Group—One group of switches is provided to effect the necessary changes on the ground side of the equipment and the auxiliaries. This is a standard group which is used ordinarily for small 600-volt car equipments, and it needs no description.

Reverser—A standard type of electro-pneumatically

operated two-motor reverser is used to reverse the connections of the motor fields, the fields being always connected on the ground side of the armatures so that no extra insulation is required.

AUXILIARY EQUIPMENT

Not of least importance is the apparatus needed for furnishing current for control, lights and air-compressor motor. It is well known that the small high-voltage machine known as the dynamotor which is used for this purpose on 1200-volt and 1500-volt equipments is the least reliable part of the equipment. This is necessarily the case, since the usual compound winding on the field makes it far more susceptible to flashing troubles, and its small size makes the insulation problem and the armature winding much more difficult. While these 1200-volt and 1500-volt equipments are giving excellent results, it was felt that it would be not only very desirable, but necessary, to eliminate the dynamotor from higher voltage equipments, especially for cars, since it would be quite reasonable to expect

5000-VOLT D.C. EQUIPMENT—SCHEMATIC CONTROL DIAGRAM

5000-VOLT D.C. EQUIPMENT—SCHEMATIC DIAGRAM OF DOUBLE BREAK SWITCH

the difficulties to be multiplied with the voltage. For this reason the entire auxiliary equipment of the 5000-volt car is operated at 150 volts. The scheme adopted is as follows:

A 150-volt storage battery, to which all of the auxiliaries are connected, is placed in the main motor circuit between the motors and ground. All of the main motor current, therefore, either goes through the battery and charges it, or through the auxiliary circuits which may be connected to the battery at the time the motors are working. By the application of a simple device, the air compressor does practically all of its work when the main motors are operating, and thus simply diverts a part of all of the main motor current as required, so that the battery is relieved from furnishing the current to the compressor motor and at the same time does not receive the high charging currents that would otherwise be imposed on it during acceleration. The battery has thus a very light duty to perform and can be made up of small cells. A set of counter-emf. cells parallels the battery during charging periods to prevent overcharging and excessive charging rates.

The voltage of the battery for such an equipment is determined by the amount of power required for the

auxiliaries. The average current required by the auxiliaries should, in order to leave a satisfactory margin, be not more than 80 per cent of the average current taken by the main motors. The use of 150 volts for the battery in this case indicates that the auxiliaries are expected to use less than 3 per cent of the total power taken by the car.

The main schematic wiring diagram is shown in the line cut on page 662 in which the double-break switches are indicated by three parallel lines across the circuit and the single-break switches by two lines. It will be seen that twelve of the former and ten of the latter are required for this equipment. Considering the fact that these switches control not only the main motor circuits for both 5000-volt and 600-volt operation, but all of the auxiliaries as well, the equipment is very simple. Very satisfactory operation on 600 volts is secured by shunting the fields of the motors.

As before stated, power for operating this car is obtained from three mercury-arc rectifiers, which receive power from a 60-cycle, three-phase system and are operated in series. Connecting the three phases of the system in series gives not only a smooth current wave, but balances the load on the three phases of the transmission system. This is believed to be the first time mercury-arc rectifiers have been used in this way to furnish so much power for high-voltage work.

CONCLUSION

It is fully recognized that the tests have not continued long enough to draw any definite conclusions as to the future use of 5000-volt direct current for railways. All that can be stated at this time is that the preliminary tests are extremely satisfactory, and the fact that no difficulties in the car equipment have appeared to date indicates that there is ground for the hope that the 5000-volt direct-current railway is a possibility. In any case the amazing fact remains that a commercial car equipment of 100-hp. motors has been designed, built and tested in commercial service and has a perfect record for the operation to date.

Second Philadelphia Report Issued

Department of City Transit Presents Modifications in Recommendations—Record of Methods Employed in Traffic Survey Is Included

The Philadelphia Department of Public Works has issued the second report of A. Merritt Taylor, director of the department of city transit, outlining the present status of new subway and elevated construction in Philadelphia and calling attention to various detailed modifications and enlargements of the original recommendations. This report is for the calendar year 1914. Abstracts of the preceding report, containing the salient construction, traffic and financial points of the enlarged Philadelphia system, were published in this paper on Aug. 9 and Oct. 4, 1913, and Jan. 10, 1914.

The 1914 report prints in full in Appendix A the co-operative program for transit development that was agreed to on May 27, 1914, by the Philadelphia Rapid Transit Company, providing among other things that when the city builds the three high-speed lines recommended for immediate construction at a cost of approximately \$46,000,000, the Philadelphia Rapid Transit Company will equip them at a primary cost of about \$12,000,000 and operate them in conjunction with its present system. The transit company has stated that it will have to rely upon the Union Traction Company to aid in securing such funds as will be required for the normal extension of the existing system, but the latter company has not agreed to this proposition and has in-

formally expressed its dissent. If the Union stockholders refuse to accept the terms of the program, both they and the Philadelphia Rapid Transit Company, Mr. Taylor states, should forfeit the protection afforded them by the co-operative program against loss of net income diverted to the high-speed lines and against loss of exchange ticket revenue, and the city would be justified in establishing the proposed high-speed system with an independent operator.

The modifications that have been found desirable since the submission of the transit commissioner's report on July 24, 1913, include the following items: (1) Location of west side of delivery loop in Broad Street instead of Fifteenth Street to save distance and curvature and avoid serious engineering problems. (2) Provision of a connection on the loop for the Parkway subway, which should be built in the near future, this provision involving an extra expenditure of about \$1,750,000. (3) Designing of North Broad Street subway below Ridge Avenue so as to allow space for the proposed subway to be built by the Pennsylvania Railroad, making a connection between the New York division and Broad Street Station partially via Broad Street. (4) Location of south side of delivery loop in Locust Street instead of in Walnut Street in order to enlarge the central business district, allow a station to be located between Chestnut and Walnut Streets and permit more favorable grades and curves. (5) Formulation of alternative elevated and subway locations for branches of the north Broad Street subway. (6) Provision under the co-operative program for free transfers in a forward direction between the surface system of the Philadelphia Rapid Transit Company and all high-speed lines at every station on the latter where surface lines intersect. (7) Determination that, if an independent operator is secured for the high-speed lines, such a corporation must build and equip the Camden tube.

In order to fix the relation of the 8-cent exchange system and its elimination to the problem of rapid transit development, the department of city transit has made an exhaustive investigation of the limits imposed by the system and of its application to various parts of the city. In this connection the range of travel for 5 cents, 8 cents and 10 cents was determined for seventy-two sections of the city, covering practically all settled parts. The department has added to its report in Appendix E a series of maps illustrating the ranges of travel for these fares from each separate section to all others, thus showing the accommodations provided and collecting all cases of discrimination in the application of the 8-cent transfer system.

Appendix C is undoubtedly the one of most general interest to electric railway operators, for herein is presented a detailed record of all the methods employed in collecting the traffic survey and other information and in working out the enlarged system described in the 1913 report of the transit commissioner. For example, calculations are inserted to show how the figure of 179 cars passing the maximum load point for the maximum hour was obtained, as well as ratios of 83.5 per cent for cars required in operation as compared to those passing the maximum load point at the maximum hour and of 40 per cent for the service factor used in determining car-hours. With its illustrative tables and maps, this appendix constitutes an admirable and lucid description of the detailed work necessary in traffic surveys.

Appendix B contains the estimated financial results to the city from the operation of the recommended rapid transit lines, both under the proposed arrangement with the Philadelphia Rapid Transit Company and with an independent operator. Appendix D is a reprint of the Pennsylvania Supreme Court Case No. 691 in re the city's borrowing capacity.

Charts exhibited in Rhode Island Company wage arbitration hearings (originals on sheets about 17 in. x 22 in.) showing labor conditions on its system. See editorial comment on first page. These charts were prepared by Prof. A. S. Richey of the Worcester (Mass.) Polytechnic Institute.

Graphs, Charts and Statistics as Aids to Administration *

Critical Discussion is Made of These Devices for Keeping Executives in Touch with Operations—Specimen Comparative Forms are Included in This Article

BY E. C. STOTHART, CHARLESTON, S. C.

The basic terms used in this article may be defined as follows: "Graphs" are statements of results written or delineated in a vivid, forcible and striking way, "a picturization of facts." "Charts" are maps of results or facts, similar to but more complex than graphs. "Statistics" are collections of facts tabulated numerically or a group of facts brought out by collecting numbers. The term also applies to the science which treats of subjects as elucidated or illustrated by enumeration of facts.

Graphs, charts and statistics all serve to bring the executives of an organization in touch with the operations of its various branches where a personal contact would be a physical impossibility. They convey quickly, accurately and intelligently the results of each department and the organization as a whole. Many executives, including heads of departments or branches, know that they are not getting all the profits or returns they should get, and yet are unable to put their fingers on the weak spots, owing to lack of condensed and comprehensible data. In nine cases out of ten there is something wrong with the organization of the business. Possibly there is no one prominent fault, but simply room for general improvement in organizing and standardizing the plant, machinery, equipment, office, sales and working forces, etc. Sometimes there are defects in the structural organization—that is, in the relations of the concern to its customers or competitors or to the sources of its raw materials.

In order that the chief executive may determine whether the organization is efficient and the results the best attainable, or whether there are leaks which must be remedied in order to obtain proper returns on investment, he must be in possession of all data pertaining to the operation of the organization. These must necessarily be in concise yet comprehensible form, as the present-day business executive's time does not permit his searching through a volume of detail. The results of operations of each and every department must be in his possession as soon as possible after the expiration of the period under consideration, and in such form as to allow a thorough understanding of conditions with the least possible delay. The individual employees and departmental heads should therefore exert every effort to formulate and devise such reports as will best serve the purpose of the executive, showing in unmistakable form data essential for economic operation but eliminating all superfluous and confusing details.

For the purpose of comparing reports compiled in graphic, chart and statistical forms, the accompanying illustrations are submitted. Form I shows fluctuations in revenue, operations and net earnings in both chart and graph form, as well as the ordinary data. While the illustration covers but one division for the current period, by use of different colored inks and enlargement of forms the same could show as many divisions as necessary for any comparative periods. It

should be noted that the graph can be converted into chart form by joining the points, as shown in the right-hand section. The chart shows fluctuations in a more connected manner than does the graph, the comparisons of the latter being more difficult to follow.

The data in Form I are probably the first to be observed by executives, as they are able to determine therefrom whether or not the business as a whole is making returns commensurate with the investment involved. Yet from this form they are unable to ascertain whether different branches are obtaining efficient results, and similar subsidiary data may be necessary. Moreover, the fact that a profit has been effected does not suffice, the questions foremost in the mind of the executive being, "What can be done to increase the profits? Are there leaks in operation? If so, where?"

ADMINISTRATION AIDS—FORM I—SHOWING CHART, ORDINARY EXPRESSION AND GRAPH FOR REVENUE, OPERATIONS AND NET EARNINGS (PROFIT AND LOSS SURPLUS)

Can revenues from transportation, sales, etc., be increased, and if so, how?" In answering these and similar questions, however, probably the first thing to consider would be the cost of operation, for most frequently restricted or decreased profits can be attributed to increased and very often unnecessary expenditures, rather than to limitations of revenue. Hence a comprehensible statement of operating costs is essential, for by it the source of loss can be readily discovered and remedied.

Form II shows both the ordinary and the graphic style of presenting operating costs. The former, taken from the trial balance, is used by clerks in preparing graphs for presentation to executives. The expenditures in dollars and cents represent nothing of value, so far as results are concerned. It is the standard set on unit costs that reveals the true conditions. While expenditures might show an increase, the car-miles operated determine whether or not the increase is warranted. While the unit costs per car-mile are shown only for total operations and general accounts, the sub-accounts would be shown in making up the regular completed statement. This comparative statement may be used for any and all divisions, and also for any

*Abstract of prize paper in American Electric Railway Accountants' Association correspondence course. For notice of award see ELECTRIC RAILWAY JOURNAL of Sept. 18, 1915, page 594.

periods, by inserting the proper titles of accounts and changing unit cost requirements, such as cost per 1000 cu. ft. and cost per kilowatt-hour for the gas and electric divisions respectively. It will be noted that while the above statement shows comparisons in dollars and cents and unit costs, it does not give increases and decreases in percentages, which are by far the most comprehensible. Such information could, of course, be obtained by inserting additional columns, but as a rule it is shown on statistical data sheets.

The cost of current would enter into this statement, but as railway companies do not usually operate power stations for production of current for car operation exclusively, it may be assumed that current is purchased from the electric division at production cost. The cost of current production in such cases would be taken up in considering operating costs of the electric division, and a pro-rata share of the expense based on the output charged to the railway.

The graph section of Form II can be adapted to any or all divisions by merely substituting titles of accounts and rescaling, and also to any number of years by allowing additional account spaces for the number required. With the graph form comparisons of months, periods and years for each account are possible and are more comprehensible than the mass of figures necessary to produce the same results. The increases and decreases can be determined by a casual glance at the graph, whereas in ordinary figure form a careful study of each set of figures is necessary. In compiling data for the graph the clerk relieves the executive of detail, for in order to obtain essential data from a mass of figures the executive must form a mental graph of conditions.

To save the executive the trouble of going through the comparative blocks shown in the graph of Form II, to determine in which accounts losses were sustained and gains affected, check (✓) columns are provided, wherein the clerk preparing the graph places checks opposite the accounts showing increases. The executive is then in position to call for analyses of accounts so as to compare expenditures made for the current period with those of preceding corresponding periods. An analysis of certain accounts might well accompany the general graph. By this method leaks in operation are

Class of Revenue	1914	1915	Change
5 cent cash fares	\$16,750	\$15,125	— \$1,625
5 cent cash tickets	5,425	4,050	— 1,375
3 cent cash fares	400	375	— 25
Chartered cars	200	150	— 50
Freight earnings	400	500	+ 100
Mail contracts	150	200	+ 50
Miscellaneous earnings (rents, etc.)	175	250	+ 75
Gross earnings	\$23,500	\$20,650	\$2,850

ADMINISTRATION AIDS—FORM III—SHOWING COMPARATIVE CHART OF REVENUE DETAILS FOR RAILWAY DIVISION AND ORDINARY FORM OF DATA USED

very frequently discovered, which enables the executive to confer with heads of departments and discuss intelligently the accounts wherein savings might be effected. The data herein involved might also be shown in chart form, but where so many accounts are concerned, the chart would be rather complex and very difficult to trace.

If after the investigation of operating costs savings are not effected to increase profits sufficiently, it becomes necessary to observe the sources of revenue in order to determine wherein lies the trouble. Form III will assist very materially in locating such sources of loss. This form shows where increases and decreases occur, and assists executives in determining the most effective course to pursue to increase revenue from the various sources—such as more rigid inspection, both regular and special; offering of prize redemption coupons to passengers; changes in schedule, etc.

Having now determined and corrected the sources of decreased profits by investigation of revenues and opera-

tions, the executive has other matters requiring attention. Are efficiencies being obtained at the power station, gas works, etc.? Are electric lines and mains in bad condition, resulting in line loss and leakage? Is the company overstocked on materials and supplies that will deteriorate, and can such stocks be reduced and the money involved be expended to better advantage? In this case, of course, there is another question to be considered—namely, if stock materials can be purchased at a declined rate, will the saving between purchase price and price when market is up be equivalent to the revenue derived from the investment of a like amount in a different way?

The solutions to the foregoing questions quite frequently might be brought to the attention of the executive more forcibly by means of charts or graphs. For example, Form IV shows a valuable chart of output, sales and leakage, which may be used for both gas and electric divisions. This can also be used for showing purchases, disbursements and balances of store stock or other material.

The uses to which charts and graphs might be put are so numerous that one might continue to compile them and explain their advantages indefinitely. Before passing to the subject of statistics, however, the writer will only mention a few mechanical charts, such as graphic meter charts, pressure gage charts, steam and flue gas charts, stack draft charts, recording watt and volt charts, feed-water temperature and rate of feed charts, car speed and mileage charts, etc., all of which are of inestimable value to the operating departmental heads as efficiency guides.

Statistics comprise statements exhibiting results obtained by process of elimination—that is, the boiling

down of a voluminous report of details to a concise and intelligible statement of facts. To an executive the statement that \$15,000 was spent on car operation, electric production, gas manufacture, etc., has no value unless he knows the number of car-miles operated, the kilowatt-hours of electricity produced and the cubic feet of gas manufactured. Nor does the statement that \$20,000 was received from transportation and sale of gas and electricity mean anything, unless he has the car-miles and the number of passengers carried, etc. With information as above, he is in a position to determine the revenue and the cost per car-mile operated and passenger carried, per 1000 cu. ft. of gas and per kilowatt-hour of electricity. A comparison of these results with standards previously set shows whether or not there is any improvement. A statistical statement for a railway division that embodies information essential for a comparison with standards is one containing on the left-hand side four columns for a particular month, showing the month's record in the preceding year, in the current year, the increase or decrease in dollars, and the increase or decrease in percentage, and on the right-hand side four similar columns reversely arranged for a series of months. The center of the statement contains the following list of miscellaneous statistics:

Passengers (revenue).
Passengers (mail carriers).
Passengers (complimentary).
Passengers (employees).
Total passengers carried.
Passengers (transfers).
Per cent of transfers to passengers carried.
Total car-hours.
Average car-hours per day.

Platform expenses per passenger.
Daily average earnings (passenger and freight).
Daily average earnings (other sources).
Daily average earnings from operation.
Daily average operating expenses.
Daily average net earnings from operation.
Percentage of operating expenses to earnings (including taxes).
Percentage of operating expenses to earnings (excluding taxes).
Percentage of claims and expenses of claim department to earnings from operation.
Cost of power per kilowatt-hour used.
Kilowatt-hours used.
Kilowatt-hours used per car-mile.
Cost of power per car-mile.
Miles of track operated.
Car-miles per mile of track.

This statement gives comparative statistical data for months and periods for both current and preceding years, showing increases and decreases and percentages of same, the percentages being the basis of arriving at accurate and definite conclusions. Since it shows only the results obtained by the organization as a whole, similar statistical statement may be made giving the results of each individual branch or department. The statement described, however, is considered sufficient for executives having general supervision of entire operations. While the information appearing thereon is deemed enough, additions and omissions might be made according to the requirements of the executive. Statistics of a similar nature might be prepared for gas and electric divisions.

An English contemporary, in commenting on the fact that most of the railway lines between France and Belgium intersect the trenches and are thus prevented from running regular trains, states that the German army is operating the lines with storage-battery cars run singly, the purpose being to remove the wounded from the front and to bring supplies to the men in the trenches.

ADMINISTRATION AIDS—FORM IV—SHOWING CHARTED AND ORDINARY GAS DATA, SAME FORM BEING APPLICABLE TO STOCK ACCOUNTS

Gas-Electric Locomotives for Dan Patch Line

This Railway, Which Is the First to Have Been Operated Throughout with Gas-Electric Equipment, Has Recently Placed in Service Three 60-Ton Locomotives, the Largest Machines of the Type Ever Built

The Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, operating what is popularly known as the "Dan Patch" electric line, has recently placed in commission three 60-ton gas-electric locomotives for freight, passenger and terminal service, these being the largest machines of the type ever built. They are somewhat similar in design although more powerful than the 57-ton gas-electric locomotive which has been in successful operation for the past year on the company's lines from Minneapolis to Mankato, Minn., and the four gas-electric locomotives, together with the thirteen gas-electric motor cars which the railway has purchased to date, constitute a complete equipment for

substantial stations, similar to those used by steam railroads, are located at the various cities and towns along the route, and smaller stations have been erected every few miles at rural stops to afford protection to the traveling public from inclement weather.

About 25 miles south of Minneapolis, at Orchard Gardens station, several thousand acres of farm land have been divided into 5-acre and 10-acre tracts by the company, and these are being sold to residents of Minneapolis and St. Paul, many of whom have erected houses and travel to and from their places of business in the city each day on the railway. There are also many attractive lakes along the route, affording excellent facilities for

"DAN PATCH" LINE LOCOMOTIVES—GENERAL VIEW OF 60-TON GAS-ELECTRIC LOCOMOTIVE

mixed traffic which is unique in the history of interurban railroading. The Dan Patch line, in fact, is said to be the first railroad in the world to have been operated entirely with gas-electric service.

CHARACTERISTICS OF LINE AND TRAFFIC

The line extends south from the company's terminal building in Seventh Street, Minneapolis, to Mankato, a distance of 107 miles. About midway of the line a branch runs northeast from Northfield to Randolph, 7 miles distant. Another extension is contemplated from Fairbault southeast to Albert Lea, Dodge Center, Rochester and beyond, having Dubuque, Iowa, as its objective terminal point. The fine rolling section of Minnesota thus traversed, with productive grain fields, dairy and truck farms, and numerous thriving towns and cities of varied industrial activity, is one of the most prosperous in the State. The territory presents few difficulties in road construction, the severest grade on the present line being 2 per cent.

The roadway was built and improvements are being constructed with a view to permanent stability, reinforced concrete being frequently used in the work. Sub-

boating, bathing and fishing, and bringing thousands of city dwellers out into the open country during the summer months. Antlers Park, a summer resort and recreation park 30 miles south of Minneapolis, is owned and operated by the traction company.

Four through trains daily each way, one of which is a limited parlor-car train, constitute the normal passenger schedule of the road. The limited train makes the run of 107 miles, including four stops, in three hours and twenty-five minutes, while the other trains require four hours and five minutes for the trip. This service is supplemented by local trains between certain points of the line and the terminals, and by excursion trains during the summer season as occasion requires. One 70-ft. gas-electric motor car, seating eighty-nine passengers, normally makes the run. When travel is somewhat heavy a trailer is added, and for excursions and extra heavy traffic a train is made up of trail cars drawn by a gas-electric locomotive.

LOCOMOTIVE POWER PLANTS

The new 60-ton locomotives are double ended, being built with the box type of cab extending nearly the en-

"DAN PATCH" LINE LOCOMOTIVES—END VIEW

tire length of the underframe and having all the weight on drivers. The wheels are 33 in. in diameter, and each locomotive is equipped with four 100-hp. motors. The truck clearances allow for 100 ft. minimum radius of curvature. The power plant consists of two 135-kw. generating sets similar to the one used in the gas-electric motor cars, only one engineer being required for its operation. The locomotives were designed and constructed complete by the General Electric Company.

Each of the two gas-electric generating sets for the power plant equipment is composed of a 175-hp., 550-r.p.m., eight-cylinder, 4-cycle gasoline engine of the "V" type, which is direct-connected to a 600-volt, commutating-pole, compound-wound electric generator with an outboard bearing supported by brackets bolted to the magnet frame. The cylinders are 8-in. bore and 10-in. stroke. Ignition is accomplished with low-tension magnetos and the sets are started by air pressure, in the same way as in the gas-electric motor cars, with the additional feature that after one set is running, the second may be started electrically from the first. The control is so arranged that either one or both of the generating units may be used to operate the locomotive from

"DAN PATCH" LINE LOCOMOTIVES—INTERIOR OF CAB

either end, in accordance with the needs of the trailing train load. Compressed air for starting is taken from the main reservoirs of the air-brake system, these being built with surplus capacity. The two main single-cylinder air compressors which are driven from the crankshafts of the main engines have a displacement of 22.5 cu. ft. of free air per minute at the rated speed and are fitted with automatic governors to maintain a constant pressure.

Great flexibility of control and economy of operation result through electrical transmission of the energy. The engines can rotate at normal speed irrespective of the speed of the locomotive and deliver their maximum power at all times, a feature of great advantage on grades, in case of snow storms, or other emergency conditions involving sudden, heavy current demands.

The locomotive is provided with an auxiliary gas-electric set to furnish power for lighting the cab, headlights and train coaches, and for pumping an initial charge of air to fill the tanks and start the main engines. This set is started by hand. It consists of a vertical, 750 r.p.m., four-cylinder, 4-cycle gasoline engine, which is direct-connected to a 5-kw., 65-volt, commutating-pole, compound-wound, electric generator. The cylinders are 3-in. bore and 6-in. stroke, and ignition is

"DAN PATCH" LINE LOCOMOTIVES—OPERATING SIDE OF EIGHT-CYLINDER, GAS-ELECTRIC GENERATING UNIT

effected by a high-tension magneto. The air compressor on the 65-volt circuit is of the two-cylinder, motor-driven railway type, and has a piston displacement of 25 cu. ft. per minute when pumping against a tank pressure of 90 lb. per square inch.

Air for all compressors is taken from the cab interior through screens and is delivered to the three reservoirs, each 87½ in. x 18 in., installed at one side of the cab in the center and connected in series, thereby affording an opportunity for radiation of heat and condensation of moisture before entering the brake cylinders. After starting the main engines, the governor cuts out the motor-driven set, and all air is supplied by the air compressors on the main engines.

MOTORS AND CONTROL

Mounted on the axles with nose suspension are four GE-205-D, 600-volt, series-wound, commutating-pole, box frame, railway motors having an hourly rating of 100 hp. each. All four axles are therefore driving axles. The gear ratio is 17 : 58, a reduction of 3.41, which is especially adapted for freight and terminal switching service, as it affords maximum tractive effort for starts and for low speeds. The motors are ventilated by a special vacuum system operated in conjunction with the engines. The performance of the locomotive is approxi-

mately such that a tractive effort of 16,000 lb. is provided at 5 m.p.h. and 3500 lb. at 30 m.p.h.

The control of the motor equipments is similar to that of standard gas-electric motor cars, a type P-53 controller being installed in each end of the cab. The motors are, however, connected permanently in pairs in parallel, and the two pairs, operated like single motors, are placed progressively in series and parallel. The controller provides seven running steps in series and six in parallel, without rheostats in the main circuit. There are also two additional points for shunting the series fields, making a total of fifteen efficient running points.

Inasmuch as electrical energy is transmitted directly, there are no losses through the intervention of mechan-

"DAN PATCH" LINE LOCOMOTIVES—DIMENSION OUTLINE

ical change-speed gearing. To produce smooth and rapid acceleration, the speed changes of the motors are effected by governing the voltage through varying the strength of the generator fields, this being accomplished by the movement of one handle on the controller. Separate handles are provided for throttling the engine and for reversing the motors. The latter operation is accomplished by changing the motor connections in the usual manner and without stopping the engines, which always rotate in the same direction. This, in an emergency, allows the train to be brought quickly to a halt independent of the brakes.

A 300-gal. gasoline storage tank, fitted with filler and filter, is installed underneath the underframing of the locomotive. The radiators are the fin-tube type and are mounted on each end-section of the cab roof, the cooling water being circulated by the thermo-syphon system. There is also a radiator draining system, the tanks being situated at one side in the central section of the cab, and a suction type ventilator is mounted in the roof between the radiators.

The principal data and dimensions applying to the locomotives are as follows:

Total net weight	120,000 lb.
Weight per axle	30,000 lb.
Maximum tractive effort	32,200 lb.
Length between knuckle faces of couplers	42 ft. 4 in.
Length over cab	44 ft.
Height over all	14 ft. 10 3/4 in.
Width over all	10 ft. 2 in.
Total wheelbase	24 ft.
Rigid wheelbase	6 ft. 10 in.

Electric current for the entire operation of the Oakwood Street Railway, Dayton, Ohio, is now being furnished by the Dayton Power & Light Company, pursuant to the execution of the contract, into which the two corporations entered on May 8.

Fair Treatment of Public Utilities

Proper Regulation by Commissions Is Advantageous Alike to the Public and to the Utilities—Financial Aspects of Regulation

BY A. B. LEACH, PRESIDENT A. B. LEACH & COMPANY, NEW YORK

Through the activities of a large number of the members of the Investment Bankers' Association of America, the development of the public utility companies of this country, the building of water and steam power plants and the construction of urban and interurban railways have given to our land a great impetus. Cities and villages have been improved, urban life has been made comfortable and convenient, rapid communication between communities has added to the comfort of travel. The changes in the character of the service and the form of equipment from the days of the horse car to the modern motor, the changes from the earlier developed plants and equipment for electric lighting and power, have been astonishingly rapid and have caused constant expenditures by these companies to keep abreast with the trend of the times.

These developments have been made possible through the issuance of bonds, of preferred and common stocks, distributed to a large range of investors through the investment banking world. In a large number of the states public service commissions or similar bodies have been organized. The best thought, both of the public service companies and the banking world, is that public service commissions, when properly organized and named, are a benefit not only to the community served, but also to the public service companies, and an added assurance and security to the investor in the securities of the companies supplying this kind of service.

It was considered that with the coming of the public service commissions it would be found that regulated monopoly was the most efficient and economical method for the development of these great industries. In a great many of the states, however, the public service commissions have seemingly felt that it was their province to grant the demands of the public for lower-priced service, for increased service, without giving due consideration to the rights of the public service companies and to the holders of their securities. As in the railroad world, a great amount of discussion has taken place as to the physical valuation of these properties, and here and there on these valuations an interest return has been computed which, when forced upon the companies, leaves a great many of these properties practically stranded.

What has been said in regard to the change in the character of the industry has a very great bearing to-day upon the actual valuation of these properties as going concerns. If a careful engineer's report is to be made on the actual properties now in use by the public service companies of this country, there should be added to this amount an adequate and reasonable sum for going values. The method of computation, the basis upon which this is to be allowed, may be one on which there may be a difference of opinion, but the fact certainly is that without this no just valuation of these properties can be had. In rate making, in view of the hazard of the business, 6 per cent allowed on a reduced valuation of the public utility property means bankruptcy; it means that new capital is not available.

In this connection, the cry of public ownership is heard. The most expensive, the most unsatisfactory, the most disastrous financial experiment that the Amer-

*Portion of president's address delivered before convention of Investment Bankers' Association of America in Denver on Sept. 20, 21 and 22.

ican cities could undertake would be public ownership of their public utilities, but unless the public utility companies are to receive fair treatment by the public service commissions, unless the public service commissions are to cease being the champions and advocates of lower rates and greater service and become guardians not only of the public but also of the public service companies, a great disaster to the investments in this country and the public service companies and a great reduction in the service which these companies bring to the public are sure to follow. This warning is the fruit of a careful lookout on the things that have taken place in the public utility world in recent months. What the American people demand is good, progressive service, developments that will keep in step with and ahead of the growth of the cities and towns. This is not possible or probable unless the public service companies of this country are met in a broad, liberal, reasonable spirit by the public and the public service commissions.

How Bay State Railway Maintains 2751 Vehicles with 680 Men

An Unusual Organization Which Effectively Cares for the Maintenance of Rolling Stock, Shops and Buildings on the Largest City and Suburban System of the United States

The system of the Bay State Street Railway embraces almost 1000 miles of track in eastern Massachusetts, New Hampshire and Rhode Island, and its equipment department handles 1020 closed passenger cars, 1095 open passenger cars, 248 plows, 148 service cars, thirty-two express cars, 208 horse vehicles and snow sledges, and 5662 electric motors. Yet the department employs only 680 men, of whom 365 work in the operating houses, 245 at the shops and on building repairs, and seventy on the preparation of material and in construction activities. There are sixteen operating divisions, with thirty-six operating carhouses and thirty-eight storage houses.

The system is divided into lines north and lines south of Boston, two grand divisions, with their own shops and carhouses, being formed in each group. In general charge of all employees and work in the department is the superintendent of equipment, whose duties are broad supervision of the maintenance of rolling stock, shops and buildings, and the design and construction of new rolling stock.

The superintendent of equipment also follows the inspection and testing of supplies, promotes standardization, confers with car engineer representatives of specialties, confers with the general foremen and inspectors of equipment upon the progress of employees as to promotion, ability and discipline, and sees any of the employees and local grievance committees. His offices are in Boston and Chelsea, Mass., and his work is carried on by dealing directly with a general assistant, a chief clerk and a special assistant, the inspector of equipment, three acting inspectors of car repairs and one acting and one general foreman on the lines north of Boston.

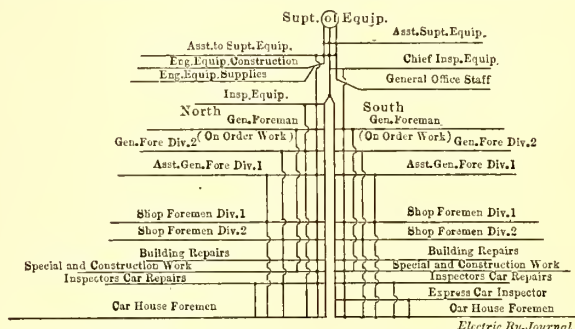

The inspector of equipment as well as one acting

and one general foreman cover the lines south. There are, also, a special general foreman on order work, and engineers of equipment construction and of tests and supplies. An automobile assigned to the department enables the superintendent to devote a greater part of his time to supervision and a much smaller part to traveling than by use of railroads or electric cars.

The assistant superintendent of equipment supervises the work done at the Boston office and performs much of the detail. He is specially assigned to all work requiring co-operation with the claim department and is held responsible for the correctness of the records of equipment. He follows the summarization of various reports for the superintendent of equipment, reads all correspondence, looks up data and confers with assistants in other departments.

The chief inspector of equipment acts as general assistant to the superintendent of equipment on the lines south of Boston. His duties cover the supervision of carhouses and shops, including the general care of the car equipment, repairs of buildings and heating plants, instruction of carhouse foremen, and following up of men as to ability and discipline. He recommends changes of location, pay and class of men, checks and approves bills and follows shop work.

An inspector of equipment has direct charge, on the lines north of Boston, of the carhouse foremen and the men in the carhouses. He confers with the general shop foremen on the routing of cars needing shop at-

BAY STATE ORGANIZATION CHART

tention and supervises the changes of equipment in the spring and fall. He reviews all reports of accidents and collisions, changes of equipment and hiring of men, as well as the reports of inspectors of car repairs.

The general foreman of grand division No. 2, north, has general charge of the shops at Lowell, Mass., and is responsible for all repair work in carhouses on the division. An assistant general foreman supervises all the work done at the Chelsea shops, where he is stationed, and that of the paint shop at Lynn, these shops serving grand division No. 1, north.

The general foreman for grand division No. 2, south, has charge of car repairs in the Fall River and Newport division at the carhouses at Stafford Road, Bowenville, Fall River and at Newport. The assistant general foreman for grand division No. 1, south, is at Campello and has general supervision of the shop at that point.

The engineer assistant on equipment construction is stationed at the Chelsea office of the superintendent of equipment. His work is confined largely to construction matters, making up drawings of new equipment and assisting the superintendent of equipment in the design of the latter. The engineer assistant sees that specifications are carried out in detail, works on the standardization of equipment, on redesigning with improvements as the object of the work, and in connection with the shops checks up patterns, castings, etc., and makes drawings and sketches for tools and machinery.

BAY STATE STREET RAILWAY—EQUIPMENT MAINTENANCE COSTS FOR FIVE YEARS

	1914	1913	1912	1911	1910
Total maintenance expense	\$759,134	\$846,030	\$757,748	\$769,061	\$775,613
Operated car mileage	30,864,039	31,641,875	30,094,113	30,322,589	29,915,956
Total cars	2,509	2,445	2,391	2,391	2,381
Cost per car per year	\$303	\$346	\$317	\$322	\$326
Cost per 1000 car-miles	\$24.60	\$26.80	\$25.30	\$25.40	\$25.90

There is also an engineer of equipment supplies who inspects and tests all kinds of materials, including material delivered at the four main storerooms of the company in Fall River, Campello, Chelsea and Lowell. He inspects scrap stock and prepares engineering data such as maintenance costs of various equipment parts, reports various items such as armatures, wheels, etc., and co-operates in the standardization of equipment.

The duties of the general foremen on order work are obvious, as are also those of the inspectors of car repairs. There are twenty-nine carhouse foremen, and the inspectors are assigned among the carhouses so that the work of each is approximately equivalent.

Manila Company Submits Service Brief

Case Before Board of Public Utility Commissioners Involves Adequacy of Car Service of Manila Electric Railroad & Light Corporation in Three Districts of Manila

The ELECTRIC RAILWAY JOURNAL of Sept. 4, 1915, page 395, contained a tabulation of traffic data taken from a count made by the Manila Electric Railroad & Light Corporation, Manila, P. I., during the six weekdays of the week from May 21 to May 27, to determine whether the service during the rush hours on certain lines in the Pasay, Malate and Ermita districts was adequate. These data were collected for use in a hearing ordered on June 15, 1915, by the Board of Public Utility Commissioners on its own motion, after it had turned down on June 7, 1915, an "unreasonable" demand made a year before that the company double the number of cars on all its city lines. Since the publication of these data, the company's complete brief in this new case, holding that it is not responsible for the so-called inadequacy of service or over-crowding of cars so long as reasonably adequate service is furnished, has been received, and the main points thereof are abstracted below. As service regulation is becoming more common, it has been thought that an outline of the defense offered would be of interest.

SERVICE FURNISHED

The car service furnished the Pasay district by the company on the lines in question, during rush-hour periods (from 6 to 8 a. m., 12 m. to 2 p. m., and 3.30 to 7.30 p. m.), consisted, at the time of making the count of passengers, of eight regular cars per hour, operated on a seven-and-one-half-minute headway. That the company has more than fulfilled its obligation to reserve for the use of second-class passengers a minimum of 60 per cent of car space is conceded. A further obligation imposed upon the company by its franchise is at all times to furnish cars or compartments of both classes sufficient to satisfy the public demand and to carry comfortably all the members of the public desiring to ride thereon. In determining whether this part of the franchise is being complied with, great weight should be given to the fact that not a single user of the service appeared at the public hearing to make complaint, to testify or to furnish information to the board.

REASONABLE AVERAGE OF SERVICE

If the board, however, carries the inquiry further to determine whether the accommodations furnished are, apart from any public demand, sufficient to carry riders comfortably, according to standards to be fixed by the board, it is assumed that the occasional overcrowding of cars will not be considered as evidence of inadequate service, but that regard will be had to the service as a whole, and that a reasonable average of service throughout the whole period under investigation will be deemed

sufficient. In *Fisher et al. vs. International Railway*, quoted in Public Service Commission Reports, Second District of New York, Vol. III, page 146, the New York board did not attempt to define with precision what would, in its judgment, constitute overcrowding. It did, however, lay down the rule that questions of overcrowding should be determined not by the conditions found in individual cars but by examination of a number of cars, operated during a reasonable period, and the number of passengers riding in those cars, and that if it should be found that during such period headway was reasonably maintained and sufficient cars furnished so that the average car was not overcrowded, the service could not be held to be inadequate.

PECULIAR CONDITIONS IN MANILA

One peculiar condition is the furnishing of two classes of accommodations. Should the service furnished by this company be judged upon the basis of entire cars, without regard to first and second-class divisions, there would be no necessity for argument. As it is, the company more than meets the requirements of its franchise and the demands of the public. The problem of providing for both classes is worked out by the company's employees arranging the division between the first and second-class compartments in such manner as to provide for the amount of traffic which experience has shown may be expected on the different lines, always allotting more than 60 per cent of the space to second-class passengers. Yet accommodation must also be furnished for possible first-class passengers, who frequently do not materialize in numbers sufficient to fill the seats provided, with the result that much waste space is carried. This condition, resulting in increased expenses, should be considered.

MANNER OF USE

Another factor worthy of notice, beyond the control of the company, is the way the public uses the service as regards voluntary standees and overcrowding for short distances. In a typical fifteen-minute period, affecting five cars of the lines in question, car No. 105, of the Pasay-San Juan line, arriving at the counting point at 6.01 a. m., contained fifty-seven second-class passengers, with seats for twenty-eight, and four first-class passengers, with seats for eight. At 6.10 a. m., or nine minutes later, car No. 117 of the same line came along, also with twenty-eight second-class seats and carrying forty-eight passengers, and with the same number of first-class seats and passengers as car No. 105. This seems to indicate a somewhat crowded condition of the second-class compartments of these two cars at the counting point, but such crowding was not the fault of the company. At 6.11 a. m., or one minute after car No. 117 and ten minutes after car No. 105, car No. 109 passed the counting point carrying only fourteen second-class passengers, but with the same number of seats as the preceding car. Four minutes after car No. 109 came car No. 39, with but three second-class passengers to a seating capacity of twenty-six and carrying eight first-class passenger seats, but not a single passenger of this class. To turn back on the schedule, car No. 37 at 6 a. m., preceding car No. 105 by one minute, carried but eleven second-class passengers, with seats for twenty-six, and three first-class passengers, with seats for eight. With an average of the five cars mentioned covering a period of fifteen minutes, or one car every three minutes, it will be seen that the total number of second-class passengers carried was 133, with seats for 136, an average of more than a seat per passenger, during one of the heaviest rush-hour periods.

It may be suggested, however, that three out of the

five cars referred to were of different lines than the two cars carrying an excess of passengers to seats, and that the runs of the three cars showing underloading did not extend to the entire length of the Pasay line. This is true. It is also true that a very large, if not the greater, part of the traffic on the Pasay line originates between Malate loop and Switch No. 2 (0.75 mile out), but that many passengers probably boarded cars Nos. 105 and 117 between Malate loop and the counting point. At Malate loop all five of the cars mentioned became available. On the Pasay line cars at the Malate loop there was 17 per cent of seats in excess of the number of passengers carried, and considerable unused accommodation was carried in the form of first-class seats. On the assumption, however, that there were some passengers standing when the car reached the loop, this fact in itself does not constitute overcrowding and implies no discomfort, and it is certain that this condition had existed over but a very short portion of the journey. Moreover, there were two remedies open to such passengers as were not satisfied with the conditions—to take first-class accommodation, at an additional cost of only 2 centavos, or to transfer to other cars with an excess of accommodation. The company having provided more than the 60 per cent of second-class accommodations required by its charter, these remedies are not deemed unreasonable. As to passengers boarding the Pasay line cars between Malate loop and the counting point, they did so voluntarily with other cars available within a reasonable time. The accommodations on the various lines are adequate, and the appearance of overcrowding is caused by the manner in which the public uses the service.

REDUCING STANDING PASSENGERS

The brief states that a very interesting and instructive article, entitled "Traffic Characteristics," appeared in the *ELECTRIC RAILWAY JOURNAL* for May 15, 1915. The following paragraph is quoted to show the difficulties and dangers arising from an effort to fit car operation, with its inelastic unit of seat-miles per round trip of one car, to an inelastic standard of service:

"The diversity of loading observed on a certain line was such that it was believed that the furnishing of 33 per cent more seats would insure no standing except by preference. At the time the original survey was made, the company was furnishing during each fifteen-minute period a seat per passenger at the point of maximum loading, but owing to the diversity of loading some cars had vacant seats and others had standing passengers. Under the circumstances, 4.2 per cent of the passenger-miles were being made by passengers who could not find seats. After the service (seat-miles) was increased by one-third, it was found that 3.8 per cent of the passenger-miles were made by standing passengers. Thus to increase by 0.4 per cent the number of seated passengers, it was necessary to increase the seat-miles furnished by 33 per cent."

COMPARATIVE SERVICE

For the whole period under consideration, 12,353 second-class passengers were carried, with seats for 10,806, or an average of seats per passenger of 0.87—or 13 per cent of passengers standing to the total number carried, and 14.3 per cent of passengers in excess of seats. The comparison between these accommodations and the standards in six American cities is most favorable to the local company. In all but one case, that of the period from 6 to 8 a. m. for in-bound cars, the result shows a service much superior to that required in these cities. The excepted case is that of in-bound cars for the period from 6 to 8 a. m., showing 56.2 per

cent of passengers standing to seats. This excess, however, is caused by no fault of the company. A reasonable use of the service by the public would distribute the traffic over these lines in such manner that excess of passengers to seats would be about the same for every period, which, with due allowance for the difference between the length of the period used as a standard and the periods taken in the American cities, would be well within the limits of adequate service. If the exact facts could be ascertained, it probably would be found that the number of passengers standing, in excess of seats provided, would be little, if any, in excess of the voluntary "standees." The Federal District Court in Washington, commenting upon a decision of the Public Service Commission of that State (Public Utility Reports, 1915 B, page 810) intimates that an excess of 33 1/3 of passengers over seats, during certain hours of the day, would indicate a congested condition requiring a remedy. The line under consideration was a suburban line in Seattle, with a large number of passengers standing for about 4 miles. In Manila, however, the excess of passengers over seats is relatively small, and the conditions are such that, if the public made reasonable use of the service, the number of involuntary "standees" at any stage of the run would be negligible, and this over infinitesimal portions of the journey.

ADDED SERVICE

While convinced that the service furnished between May 21 and May 27 was adequate, the company has materially increased this service by extending the run of certain cars beyond the Malate loop into the Pasay district as far as Switch No. 2. Eight cars are thus operated during the rush-hour period from 6 to 8 a. m. These cars provide seats for forty passengers, which means, for the additional service, a capacity of taking up 320 passengers per day or 1920 passengers for a six-day period. This additional service during the rush-hour period adds about 50 per cent to the accommodations provided during these hours, and changes the average of seats per passenger on this line from 0.74 to 1.15. This additional service, however, is so far in excess of what should be required of the company under all the circumstances, that its discontinuance would be warranted, in view of the decrease in earnings.

Operating Costs for Omnibuses in Sheffield, England

The *Tramway and Railway World* in a recent issue submitted the following results of the omnibuses operated in the town of Sheffield, England, by the Sheffield Corporation Tramways, the figures covering the fiscal year 1914-1915. Expenditures are given in cents per bus-mile:

Superintendence	0.03
Platform wages	4.39
Other traffic employees' wages	0.18
Cleaning and oiling	0.86
Miscellaneous traffic expenses	0.56
General expenses	0.74
Repairs to chassis	1.69
Repairs to body	0.40
Repairs to wheels and tires	1.57
Repairs to tools	0.03
Repairs to buildings and fixtures	0.09
Miscellaneous repairs	0.05
Sundry road expenditures	0.11
Gasoline	3.37
Total operating expenses	14.07

Fares averaged about 2 cents for a distance of about 1.12 miles, the longest omnibus route being 6.5 miles. The receipts amounted to 20.94 cents per bus-mile. There was set aside for depreciation 2.15 cents per bus-mile, for interest and sinking fund 1.09 cents, and for income tax on profits 0.13 cent.

"Red Special" Itinerary Works Out Well—Details Are Given Herewith—Chicago Section Conducts Novel Suggestion Contest and Sends Winner to San Francisco—Best Suggestions Are Outlined Below

ON THE TRAIL OF THE "RED SPECIAL"

Supplementing last week's brief note regarding the "Red Special," the following notes bring the history to the JOURNAL's press hour. After a stop of one and a half hours in the city of Chicago, the train left for National Glacier Park. There were fifty ladies and eighty men aboard.

The train reached Glacier Park at 2 o'clock on Sunday afternoon and left for Spokane on Monday evening. During the stay the party visited St. Mary's Lake and the encampment of Blackfeet Indians located in the park. Here Messrs. Pierce, Gale and McConnaughey were admitted into membership of the Indian tribe with appropriate ceremonies. The party reached Spokane at 9 a. m. Tuesday and was met at the station by the following representatives of the Washington Water Power Company: Vice-President Bleeker, General Manager MacCalla, Secretary Steele, Superintendent Wilson, Claim Agent Aston and Chief Engineer Uhden. Next morning the party took three-car trains of this company on its interurban line to the suburbs, where a very successful inspection test was made of the Wilson automatic stop. Then the party took lunch at the hotel and enjoyed automobile drives in the afternoon. A separate lunch was given to officers of the association and a few others at the Chamber of Commerce Building by the Chamber of Commerce. After this luncheon speeches were made by C. Loomis Allen, Charles L. Henry, William J. Clark, W. F. Ham and Charles C. Pierce. All discussed the needs of the electric railway, the importance of electric railways in the development and prosperity of the cities, the need of more liberal and fairer treatment of the electric roads and the desirability of co-operation on the part of chambers of commerce and other bodies of public-spirited and influential citizens. At the close of the meeting the president of the Chamber expressed the appreciation of his organization at the opportunity of hearing these remarks. The local papers in the evening editions gave considerable space to the addresses.

The departure of the special train from Spokane in the evening was delayed several hours so that the train would go through the Cascade Tunnel of the Great Northern Railway by daylight. Seattle was reached by Wednesday noon.

The "Red Special" party spent Wednesday in Seattle as guests of the Puget Sound Traction, Light & Power Company inspecting the system and touring the city in automobiles.

Thursday was spent in Portland, the travelers being the guests of the Portland Railway, Light & Power Company. The party was taken by electric cars to the principal points of interest. Several members also attended a farewell luncheon which was extended on this day at noon by the Portland Chamber of Commerce to F. W. Hild. Mr. Hild recently resigned as general manager at Portland to become vice-president and general manager of the Denver Tramway System, succeeding John A. Beeler, resigned. At the luncheon C. Loomis Allen, W. F. Ham and Charles C. Peirce addressed the members of the Chamber on the electric railway problems of the day. President Griffith then paid a tribute to the ability of the retiring manager, who replied in

a fitting speech. The train left Portland for San Francisco exactly on schedule at 8.15 Thursday evening via the Southern Pacific Railway.

The trip has proved a very delightful one, and the number of passengers has grown to 131, including fifty-two ladies.

The committee in charge of the train, headed by Frank H. Gale, master of transportation, and H. G. McConnaughey, secretary of the Manufacturers' Association, had most carefully planned all details, and provided surprises each day, in the way of flowers for the ladies and other attentions.

CHICAGO SECTION SENDS TWO MEN TO CONVENTION

At the first meeting of the Chicago Elevated Railroad section following the summer vacation two members were elected as delegates to the San Francisco convention. One of these delegates was elected by a popular vote of all the members of the section and the other was selected because he submitted the best suggestion for improvement in the elevated railroad service, which at the same time would effect a considerable money saving. A. H. Daus, assistant master mechanic, was elected a delegate in a very close contest, winning by only eight votes. Mr. Daus began service as an armature winder in the shops of the elevated railroads in 1898. He was successively advanced to various positions in the mechanical department and was appointed assistant master mechanic in 1913. For the employee submitting the most meritorious suggestion, C. E. Shaw, Metropolitan division foreman of signals and interlocking, was selected. Numerous suggestions were submitted, and the rather unusual thing about the winning suggestion was that it applied to the train service which was entirely out of the winner's department. The winning suggestion, as well as other suggestions of merit, follow:

WINNING SUGGESTION

A means of cutting down operating cost while running trains at same interval from 9.30 a. m. to 4.30 p. m., and from 7 p. m. to 12 midnight—twelve hours out of twenty-four. Every other train from the four branches to run express on track No. 3 east from Marshfield Avenue to Franklin Street without stop—and express west on No. 1 track from Franklin Street to Marshfield Avenue without stop. Trains that run express east to run local west, and trains that run local east to run express west, thus saving four minutes running time on each round trip. Two minutes more can be taken from the relay at the terminal, making six minutes, the interval of trains, which will allow one train to be taken off of each branch, thus saving the cost of running four trains for twelve hours out of each twenty-four hours.

CHARLES E. SHAW,

Foreman of Signals and Interlocking.

WINNER OF SECOND PLACE

A suggestion for reducing maintenance cost on electrical equipment:

The introduction of a fusible element into an electrical circuit so installed that the temperature of coil or apparatus will melt the fusible element and automatically open the electric circuit before high temperature has affected the insulation and caused the apparatus to become short-circuited, thereby saving the cost of rewinding, plus that

of material. The fuse can be installed on the most accessible parts.

Test made with fusible element:

Temperature at which enamel covered wire will carbonize and cause short-circuit.....	450 deg. Fahr.
Temperature at which fuse will melt.....	320 deg. Fahr.
Highest operating temperature of coil in service....	200 deg. Fahr.

This fusible element can be introduced into circuits of pilot motor, reverser and pump motor on South Side cars, and of reverser, current relay, reset coil on Type M cars on Northwestern Elevated cars.

Number of roasted pilot motors due to jamming, per month, twelve

Cost of rewinding armature, field and brake coils.....	\$9.40
Cost of renewing fuse.....	.50
Net saving on repairs.....	\$8.90

Total saving per month based on average number of failures on pilot motor.....	\$108.80
Average cost of repairing roasted reverser coils.....	5.00
Net saving on repairs to coil.....	4.00
Total saving per month based on six failures.....	24.00

The introduction of a fusible element will not reduce the number of failures, but will only reduce cost of repairs.

A. H. DAUS, Assistant Master Mechanic.

OTHER MERITORIOUS SUGGESTIONS

After a careful study of trains in operating at Kimball Avenue terminal I find we can reduce the number of hours in the tower from twenty-four to ten per day, except Saturday, which should be fourteen hours on account of adding and cutting cars. At present they are working a twenty-four-hour trick, but the following schedule should apply:

Daily (except Saturday), 6 a. m. to 11 a. m., and 3 p. m. to 8 p. m.

Saturday from 6 a. m. to 8 p. m., fourteen hours.

Sunday—No work at all.

The present practice requires 720 hours, \$244.80 per month, or \$2,937.60 per year. The saving would be 276 hours, \$103.84 per month or \$1,245.08 per year.

JOHN MANNION, Dispatcher.

A fund providing for sickness, disability and old age might be established by the Chicago Elevated Railways on a co-operative basis, the company and the employees to contribute to the fund in an equitable manner. A committee composed of officers and employees of the company should be appointed to investigate thoroughly all organizations related in any way with such a plan and then submit the result of their investigation, together with their recommendations, to a mass meeting of all employees and officials of the company.

The establishment of such a fund and its proper control will do more to advance the interests of the company, and engender a spirit of faithful service than anything I know of. A contented and efficient set of employees is the greatest asset of a corporation. "Co-operation First."

JOHN MCINTOSH, General Supervisor of Service.

At this meeting of the section 160 members were in attendance, and the secretary reported twenty new applications, which makes the total membership 188. In the program which followed H. A. Otis, engineer in the office of the master mechanic, spoke on the value of coasting. He explained what coasting is, the many benefits to be derived from it, and the measures that have been taken by electric railways throughout the country to encourage the motormen to do more coasting. He also described the various methods employed to increase coasting and outlined a scheme of installing coasting boards on the elevated railway system to increase coasting. He said that after carefully experimenting and testing the service the general supervisor of service had selected locations for these boards. In addition to this the supervisor spends his entire time in instructing the motormen and their immediate instructors in the proper method of train operation, paying particular attention to coasting.

J. T. McIntosh, general supervisor of service, spoke on "The Efficient Motorman." He discussed his subject by taking his audience, in imagination, on the trip

from one end of the road to the other, during which he outlined what the efficient motorman would do at each particular point and in every conceivable circumstance or emergency. Mr. McIntosh stated his belief that much could be accomplished to increase coasting by instructing the motorman. He felt that work in this direction was as important as the installation of instruments for recording the amount of coasting.

Women Conductors in Berlin

As noted in the ELECTRIC RAILWAY JOURNAL for April 24, 1915, the Grosse Berliner Strassenbahn (Great Berlin Street Railway) had already found it necessary to employ more than 600 women as conductors to take the place of men called to the front. At that time more than 50 per cent of all the employees had already been called to the colors. It is very likely that this percentage has since been greatly increased because the government has made further levies, and because it is the practice of German railways in hiring men to favor those who have already been in the army.

WOMEN CONDUCTORS IN BERLIN—A LECTURE ON PLOW COLLECTOR AND OTHER CAR DETAILS

The accompanying illustrations were recently taken in the inspection room of this railway. One of them shows a class of women being instructed in the use of the plow collector and other details. It will be observed also that the room contains parts of overhead equipment, it being customary to instruct platform employees in the correct names of line fixtures. An illustration taken in another part of the same room shows a demonstration of truck and track equipment; also the application of trolley catchers and headlights.

WOMEN CONDUCTORS IN BERLIN—STUDIES IN TRACK AND TRACK EQUIPMENT

COMMUNICATION

Standards in Car Design

NEW YORK, Sept. 22, 1915.

To the Editors:

Mr. Gonzenbach's communication under the title "Cars at Less Than Cost" in the Sept. 11 issue seems to contain the following inferences: (1) Each car builder should make only one standard type of car. (2) Car builders' overhead expenses are too high. (3) He suggests a remedy.

As car builders have been fighting for years for standardization and the *ELECTRIC RAILWAY JOURNAL* has published editorials urging the same, it is encouraging to have a manager of Mr. Gonzenbach's prominence at last fall into line—in theory at least. Numberless cars have been designed and patented by railway men and manufacturers in the confident belief that they would be generally adopted as standard. Recently we have the Hedley-Doyle car, the Jones car, the Adams car, the Mitten car, the Brinkerhoff car, the Birney car, the "Peatwit" car, etc. All have great merit. But none has been nor will be adopted as standard.

If these men, who are familiar with all requirements, have failed to produce a standard car, what hope is there that car builders can design one which will be acceptable to all? Cars will continue to be built to suit local conditions, and automobiles will be designed for general conditions.

While a standard car would prove a blessing to the car builders, it is a question whether the railways could afford to confine themselves to it for any extended period. Without the initiative and courage exercised by the above-named men and other men equally courageous, we still would to this day be riding in bob-tail "hay-burners" over strap rails.

As to overhead expense in car building, I venture to say that it is kept much lower than the average in other lines of manufacturing of equal volume. A considerable percentage of this overhead burden is selling expense, and for this the railways are to some extent responsible. I have known several cases where a dozen or more high-salaried salesmen and engineers were detained for from one to two months by frequent postponements on the part of railway companies in letting contracts for cars. Doubtless the purchaser thought this was costing him nothing and that impatience and nervous exhaustion among the supply men might result in concessions which could not be obtained earlier. But selling expense is a legitimate part of manufacturing cost and ultimately the consumer pays for it. How many purchasers appreciate that they are paying the expenses of the men they keep waiting in anterooms and hotel lobbies?

A real saving in the cost of cars and real competition, also, could be effected by receiving sealed proposals at a stated time, opening them in the presence of the bidders, announcing the prices publicly, and awarding the contract to the lowest responsible bidder.

Now, as to Mr. Gonzenbach's remedy, I quote as follows from his communication: "Let them produce a standard car at a standard price, based on an output of 100,000 cars a year, or something like that." There are about ten active electric car builders. This would mean a total output of 1,000,000 cars per year. However, the average number of cars purchased per year during the last eight or ten years was approximately only 5000, and this shows clearly the impossibility of making a production proposition out of car building along the lines that have been applied to automobile manufacture.

CAR BUILDER.

Commerce Commission Hears Principles of Valuation Discussed

Depreciation proved to be the chief bone of contention on Sept. 30, the first day of the three-day conference called by the Interstate Commerce Commission to discuss the fundamental principles of valuation. W. G. Brantley, speaking for the carriers, reiterated his argument made at the conference last May, that the use of the component parts in the complete railroad should govern, and that therefore there should be no depreciation deducted unless there was deferred maintenance. For instance, he would consider track as a whole, and not as individual ties and rails. Questions put by the director and several of the commissioners indicated that they doubted their authority to do this under the valuation act.

About 100 men attended the sessions. The carriers' arguments were presented by four of counsel, G. S. Patterson, Pierce Butler, Sanford Robinson and Mr. Brantley. They indicated at the start that they would need at least two days. They had already filed a 544-page brief with the commission, printed copies of which were available. As the State commissions had not held any meeting to formulate an argument, the members present indicated that they would confine themselves to the filing of briefs.

The carriers had divided their argument into nine sections. Mr. Patterson discussed the first—the purposes of the valuation act. He cited seven reasons, including bases for rate-making, taxation and capitalization.

Mr. Butler, discussing cost of reproduction new, brought out briefly the main points hitherto presented by the carriers relative to the determination of quantities and the overhead allowances. Mr. Robinson discussed separately the fixing of unit prices, asking the exercise of the best judgment and the consideration of prices for a ten-year period.

Mr. Brantley's topic was "Appreciation and Depreciation." He began with the latter, and had not finished when the conference was adjourned for the day.

Flange Oiling

At the recent convention of the Traveling Engineers' Association it was stated that the wear on the wheel flanges of steam locomotives was one of the greatest sources of annoyance and expense in maintaining the machines in service, but it was estimated that, by the use of a flange oiler, the mileage between tire turnings for flange wear would be increased from three times to four times the original figure. Also, the rapid wear of rails can be eliminated to a certain extent by the use of flange oilers that positively deliver jets of asphaltum oil against the flanges of the wheel. On one division of the Erie Railroad the saving in rails on curves was reported to be 66 per cent. On the Delaware, Lackawanna & Western Railroad the saving on curves alone warranted the expense of flange-oiling equipment, and in addition, the saving on the tires was more than 60 per cent. It was stated that proof had been given by a number of roads that the flange oiler does prevent derailment. The impression that any crude oil would do to use with a system of flange oiling was common, but several experiments have proved that results cannot be obtained unless the oil contains from 40 per cent to 60 per cent of asphaltum in solution, and is low in grease and paraffine. All oils that are low in asphaltum and high in grease and paraffine will run down onto the thread of the wheel, causing slipping and tending to defeat the purpose of the device.

Good Results from Old Motors in Atlantic City

BY GEORGE F. FABER, GENERAL SUPERINTENDENT ATLANTIC CITY AND SHORE RAILROAD

The problem of getting maximum efficiency out of the older types of motors, such as Westinghouse No. 68, of which we have forty two-motor and one four-motor equipments, has been a difficult proposition in Atlantic City, especially for the reason that these motors are used during the heavy-service summer months and on an average line voltage of about 575, with severe surges at times due to the starting and stopping of the heavy trains run by the West Jersey & Seashore Railroad from which this company buys

In the overhauling of these motors, which are nearly twenty years old, we find that the housings in the motor frames have become worn. We have not rebored them, as at present we have not the facilities to do this work, but have shimmed them up with hard fiber shims. Some roads have designed a special machine for reboring motor shells, which is the only proper way to get correct results, but we could not undertake this all-important operation at this time. We have also slotted the commutators, and have changed the motor connections to make all the motors field-fed. The top covers have been left off, and the bottom inspection covers have been perforated to allow more ventilation and to get rid of the carbon and copper dust. This formerly was quickly deposited on the armature and

in the case, and was the cause of many of the flash-overs in the motors of Types 68 and 68-C.

Since we have thoroughly overhauled all open-car equipments we are getting excellent results, not only in commutation but in good lubrication of bearings, and have not had a car taken out of service for a grounded armature since the cars were placed in service in April. With the improvement in the motors and careful inspection, together with the fact that we test everything thoroughly before it gets into a car, our maintenance cost has decreased materially and I believe it will continue to do so.

Many roads would recommend scrapping such old

equipment, believing it to be more costly in the end to make these improvements than to purchase the newer types of motors, but I find the Westinghouse 68 and Westinghouse 68-C motors are very economical from a power consumption standpoint and feel now that we are getting very satisfactory results.

Indexing Car Equipment Data

BY NORMAN LITCHFIELD, M. E.

The indexing of data has been the subject of much study in all classes of knowledge, engineering or otherwise, and many systems have been evolved in the attempt to obtain one which would make the data instantly available when needed. Outside of the many valuable handbooks each engineer must, of necessity, collect information pertaining to his particular line of work, and as time goes on and the mass of material assumes considerable proportions some system of filing and indexing becomes imperative. In the choice of one suitable to the nature of the information lies the success or failure of the collection of data.

One of the most successful index forms is that known

GOOD RESULTS FROM OLD MOTORS—WESTINGHOUSE 68-C MOTOR BEFORE AND AFTER REMODELING

its power. In addition, the heavy riding season in Atlantic City continues for but ten to twelve weeks, necessarily involving the employment of a large force of inexperienced men to operate the cars, and just about the time when these men are becoming thoroughly competent in their work the season is over, and off they go. Thus, green men handling old equipment with high and irregular voltage make a bad combination for efficient operation and low maintenance charges, and our shop forces have been kept very busy.

The most unsatisfactory feature of the old type of motor was the poor design of oiling device. To remedy this condition we have installed cast-iron lubricating oil boxes like those shown in the accompanying illustration, which make waste-feeding oil boxes equal to those on modern motors. We are using solid armature bearings with openings for oil feed only at the top, and are also cutting out the openings in the bearings to nearly twice their original size to give more contact surface between the waste and the armature shafts. We are still using babbitted, iron-shell armature bearings, but are now figuring on eliminating these gradually and replacing them with solid bronze bearings.

as the Dewey decimal system, which is in use by many large libraries and industrial concerns. It consists essentially of the division of the subject data to be classified into nine chief subdivisions, each being numbered one of the integers from 1 to 9. Each subdivision is then again divided into nine further classes, the first being numbered, 1.1, the second 1.2, the third 1.3, etc. Still further subdivision may be used, as 1.21, 1.22 or 1.31, 1.32, etc. This has many advantages over other systems, such as the alphabetical, and lends itself readily to car equipment data.

The following nine main subdivisions are suggested, having been found in practice to cover the ground conveniently and thoroughly.

- | | |
|----------------------|----------------------|
| 1—Office. | 6—Transportation and |
| 2—Weights. | traffic. |
| 3—Costs. | 7—Specifications. |
| 4—Progress. | 8—Dimensions and ca- |
| 5—Equipment data. | pacities of cars. |
| 9—Other information. | |

Under the first heading may be grouped matter concerning the office and needed for ready reference, such as addresses, rates of pay, records of service, etc. The second and third classes are selected because it was found that if the weight of an article such as a brake-shoe was listed under a detailed subject heading it might be found either under "brake," "shoes" or "truck details." Again, many parts are called by different names—thus, a "swing hanger," "swing-motion hanger" or "swing-link" all denote the same part. Obviously the same principle is equally true in regard to costs.

With the Dewey system as applied in the foregoing if the weight of a part is desired, one first looks over the short list of nine main divisions, which the eye scans readily, and instantly selects the division under which the desired item is most likely to be found. One then turns to the page of the catalog headed "weights," at the top of which is found the following list of chief subdivisions.

2—Weights.

- | | |
|--------------------------|------------------------|
| 2.1—Cars, complete on | 2.5—Brake parts. |
| trucks. | 2.6—Control parts. |
| 2.2—Car bodies and | 2.7—Motor and parts. |
| parts of body structure. | 2.8—Other electric and |
| 2.3—Trucks and parts. | pneumatic equipment. |
| 2.4—Equipment com- | 2.9—Miscellaneous. |
| plete. | |

If the article looked for does not fall in any of the first eight classes one turns to the page headed 2.9 where there may be found:

2.9—Miscellaneous.

- | | |
|----------------------|-------------------------|
| 2.91—Draft rigging | 2.95—Windows. |
| 2.92—Seats, cushions | 2.96—Hardware. |
| and backs. | 2.97—Hand holds. |
| 2.93—Doors. | 2.98—Destination signs. |
| 2.94—Pneumatic de- | 2.99—Other parts. |
| vices. | |

The same or a similar subdivision is applicable to Division No. 3, covering costs.

The fourth division, "progress," is intended to cover important dates and amount of work accomplished on jobs which require particular attention. The fifth division, or "equipment," covers main items such as number owned, date of manufacture and other general information, the subdivisions being the same as those under "weights."

Division No. 6 includes data in regard to operation of cars and other data upon transportation. Division No. 7

gives lists of all specifications and any notes thereon. Division No. 8 gives chief car dimensions and capacities which are apt to be distributed over several drawings and are brought together here for ready reference.

One of the chief advantages of this system is that it permits of indefinite expansion without disturbing or rearranging the data already collected and indexed. It has been found applicable not only to sets of file cards, but, in a modified form, to the filing of tracings. In the latter case, all tracings are numbered serially, the latest revisions being denoted by the subscript *A*, *B*, *C*, etc., and listed in a catalog classified under the Dewey system, one copy being kept in the drafting and file room and another in safe deposit to guard against loss by fire of the office copy or otherwise.

Practical Views of Special Work—II— The Crossing

BY R. P. WILLIAMS, INSPECTOR OF SPECIAL WORK
BROOKLYN RAPID TRANSIT SYSTEM

In the article published in last week's issue it was stated that the present design of special work is wasteful. Take the case of a double-track branch-off and assume that 75 per cent of the wear is confined to one run. When that side is worn out, all of the frogs must be thrown away with over half their life still in them, and with the tongue switch and mate having one-third of the wearing surface in good shape. With solid manganese the percentage of waste is increased. The writer advocates a practical change of design so that the worn portion may be discarded, and new parts installed without disturbing the pavement. This has been the ideal in connection with all special work construction. The crossing being the hardest proposition in maintenance, it will be interesting to see if this plan is feasible, and if it is feasible in the crossing, the same principle may be used in the tongue switch, mate and frogs.

In Fig. 10 is shown a rough drawing of one-half of a 90-deg. crossing with an entirely renewable top, the whole being within the lines of the present accepted conditions. There is not one renewable part as big as a manganese tongue-switch bed, while in the present design of branch-offs and complicated layouts there are many larger pieces designed for renewability. The writer showed a similar plan to a prominent manufacturer, who said, "The plan is good, it is feasible and sound. The point will be to impress the necessity for a good foundation." And that is the point; if the plan is accepted, it should be with the consideration of an all-steel permanent tie bed. Referring to the drawing, it will be noted that the crossing consists of four main interchangeable iron castings, *F*, 10 in. in depth. These would, of course, be better and lighter if made of steel. The renewable parts, *A*, *B*, *C*, *D*, *E* and *G*, are also interchangeable, calling for seven patterns. The complete crossing consists, all told, of fifty-two pieces, counting the eight joints, as against the present design which requires 104 pieces, counting the joints sixteen in number, all subject to wheel wear. In the new design there are no such joints. *D* is one piece reaching across the devil strip, and bridging the joint of the substructure. This is the only piece which would have to be babbitted in the field, the balance being fastened in the main casting, *F*, at the factory. The only unsatisfactory feature is that the cavity for the bolt head is one-half in each of the castings, *F*. This might be made so that there would be eight holding-down bolts, the center ones being shifted so that four would be in each arm. That is to say, one of the center bolts could be staggered so that there would be one on each side of the joint. The cross-section, Fig. 12, shows the fish-plate arrangement

was used and one of the posts was 1/16 in. low. Without disturbing the babbitt, the center was removed, a liner of the proper thickness was inserted, and the center was bolted back with the same nuts. Fig. 15 is a plan view of the fastening referred to, the detail at *BB* showing strips in place to prevent babbitt or dirt entering the lower chamber.

In the cross-section *AA*, Fig. 16, the bolt at the bottom is shown turned as at *CC* in the plan, while the one at the top is shown turned ready to be lifted against the bottom of the babbitt for removal. If no babbitt is allowed to enter the lower chamber or to mount up along the bolt (and by this is meant that the lower chamber must contain nothing but the bolt head), the nuts may be loosened at any time, and the bolts turned back as at the top in Fig. 16, then lifted and a pry inserted under the nut, thus removing, at once, bolts, babbitt and center. With this type of fastening used in constructing the tongue switch shown in Fig. 2 of the article in last week's issue, the problem of repair, even in the present form of construction, would be solved.

A Safe Wheel-Changing Jack

Safety and flexibility are the essential features of the novel wheel-changing jack used in the shops of the Sioux City (Iowa) Service Company's shops. This jack is 15 ft. in over-all length and employs the pantograph principle. It is manually controlled through a crank, gear and pinion. The changing mechanism is mounted on a truck equipped with roller-bearing wheels, which in turn rest upon a track extending the full length of the repair pit. The roller-bearing wheels were adopted so

SIoux CITY WHEEL-CHANGING JACK

that the jack carrying a car wheel could be readily moved from beneath a car by one man. The parts of the pantograph or folding-jack mechanism are made of 3/8-in. x 3-in. steel bars with pin bearings. A swiveled saddle supports the axle of a pair of wheels at two points, and the range of the jack is such that as soon as the wheels are released from the track rails the axle may be swung in line with the track and the wheels lowered to clear the underside of the truck. The man

at the operating crank is 6 ft. away from the wheel, consequently well in the clear if any accident should occur. A view of this unique wheel-changing jack is shown in the accompanying illustration.

Quickly-Adjustable Feeder Grip

A tool for handling feeder cables from 250,000 to 500,000 circ. mil capacity, lead-covered cables and steel messenger wire, is being marketed by Mathias Klein & Sons, Chicago, Ill., and is shown in the accompanying illustration. The main body construction of the grip is of substantial steel casting. Pivoted side plates control the action of the upper and lower jaws. The upper jaw is removable to facilitate application of the cable.

GRIP FOR LARGE-SIZE CABLES

It is merely necessary to disengage lugs from the notches in the side plates in order to remove the upper jaw before or after using the grip. The manufacturers claim the grip to be rapid in application and release, and automatic in action, thus embodying an improvement over the old troublesome chain and ring method of stringing large size cables. Its hold is in direct ratio to the pull exerted. The grip is made in two sizes, one for 5/8-in. strain and the other for cables of 250,000 to 500,000 circ. mil.

In a recent test by a large operating company, 19,500 ft. of 500,000 circ. mil insulated feeder cable was pulled in place without the slightest slippage or damage to the insulation.

Pole-Guy Anchor Tests

The Faultless Anchor Company, Fostoria, Ohio, recently conducted an elaborate test upon several different sizes of anchors in order to obtain data bearing upon the holding strain of the devices and also to determine the ultimate strain required to break the anchor or to pull it from the ground. In the test the load was tied to the anchor by connecting it through a dynamometer with a double set of large blocks and a heavy-duty chain-fall to a heavily-guyed pole of normal height. A substantial initial strain was first applied and a mark made on the anchor rod to indicate its initial position. The creeping of the rod was measured from this initial margin, the load being added in increments of from 500 lb. to 1500 lb. Measurements for creep were made between each loading, and an interval of five minutes without strain was allowed between each pair of loads.

The result of these tests was as follows: A two-blade, 16-in.-spread anchor with 1/2-in. rod held without creep at 5500 lb. pull and broke in the rod at 6600 lb. A two-blade, 18-in.-spread anchor with 5/8-in. rod held without creep at 4800 lb. when one blade broke because of a flaw in the casting. The capacity of this anchor is said to be about 9000 lb. A three-blade, 18-in.-spread anchor with 3/4-in. rod held without creep at 12,800 lb., the blade bending down at 13,200 lb. pull. A four-blade, 24-in.-spread anchor with a 1-in. rod had its blade bent down at a pull of 5200 lb. without any creep having been previously apparent. This type of anchor is newly

designed, being intended to hold a load of 16,000 lb. without creep in dead-end and cable-strain service, and as this test was the first to which the new design was subjected, it proved that the fins require more metal.

Compressor for Light-Weight, Low-Floor Cars

Reductions in weight and decreased clearances incident to low-floor cars have created a demand for a light-weight minimum-dimension air compressor, and such a design has recently been developed by the National Brake & Electric Company, Milwaukee, Wis., the new machines being exhibited in the company's booth at the San Francisco Exposition. This compressor is known as the National Type MW-1. It embodies all the latest improvements in air-brake compressor design, including an improved method of preventing the loss of oil or escape of oil vapor from the casing. Ease of ac-

LIGHT-WEIGHT AIR COMPRESSOR—CROSS-SECTION OF COMPRESSOR

LIGHT-WEIGHT AIR COMPRESSOR—HORIZONTAL SECTION OF COMPRESSOR

cess to all working parts, and a quick and easy method of mounting and dismounting by means of three-point suspension straps, are also distinctive features.

The motor is of the four-pole, direct-current, series-wound type, and it is completely inclosed, equipped with two field coils and designed to operate with its frame grounded. Important features provided in the motor construction are a slotted commutator, improved commutation, increased creepage surfaces, low temperature rating, spring plates for holding field coils rigidly in place, laminated field yoke and pole faces, protection for armature winding and brush-holders mounted in fixed position on the frame. A simple method of adjusting the brush pressure is used, and provision is made for easy removal of the armature. In general, the construction is compact and rugged, and the design obtains a high efficiency.

LIGHT-WEIGHT AIR COMPRESSOR—VIEW WITH COVER AND CYLINDER HEAD REMOVED

The compressor has a displacement of 10 cu. ft. per minute when operating against 100-lb. pressure. It has an over-all height of 10 $\frac{3}{4}$ in., and it weighs 400 lb., or 420 lb. with the suspension irons, brackets and bolts included. The compressor is of the gear-driven, single-acting, duplex, horizontal type.

Both the motor and the compressor form a complete, compact, dustproof unit. The cylinders, crankcase, motor housing and bearing brackets are cast in one piece, which provides rigidity and insures perfect alignment. A handhole in the front or cylinder side of the crankcase gives access to the pinion, and a hinged cover with positive locking devices on the motor end of the compressor provides access to the armature, field coils and brush-holders. Two sectional drawings shown in the accompanying illustrations give the dimensions and detailed arrangement, and a halftone illustration shows the air compressor with the cover and the cylinder head removed.

Electric Shovel for Railway Work

In 1903 the Thew Automatic Shovel Company, Lorain, Ohio, manufactured its first electric shovel, and this proved to be so successful that another type was brought out, this being similar in fundamental design, but modified in many respects to adapt it to the particular requirements of electric railway service. This shovel likewise was a success and at the present time many of the larger city and interurban lines of the country use it to handle all their excavating.

The horizontal "crowding" motion which is one of the features mainly responsible for this shovel's success, has proved to be ideal for digging shallow cuts, track trenching, grading interurban roadbeds, and for speed in performing the various kinds of work encoun-

AUTOMATIC ELECTRIC SHOVEL

tered in city and interurban lines. By reversing the crowding motion, an extremely powerful prying action is obtained which affords the most economical method known for tearing up concrete and track ballast, the shovel being frequently used for removing old rails and ties.

It is of the full-circle-swing variety and is very compact, features of great advantage in through-cut work or places of limited working space, and it also has a special jack-knife boom that will swing under trolley wires. In addition to handling all kinds of excavating, the shovel can be used for loading coal from stock piles, for handling pile drivers and for limited crane service. It is self-propelling, operated by one man, mounted on traction or car wheels or both and has proved to be a very profitable investment for even the small railway that has comparatively little excavating work to do.

Ballasting Economy

The replacement of hand labor with machines has become the fixed policy of nearly every up-to-date electric railway company. This has led to the development among other devices of the "Imperial" pneumatic tamping machine, which is manufactured by the Ingersoll-Rand Company, New York, and which has proved to be the means of materially reducing the cost of track ballasting and maintenance.

The tampers are operated in pairs, one on each side of the tie. The operation of the tool is a rapid hammer

TAMPING OUTFIT ON CLEVELAND RAILWAYS

action on the tamping bar, which in turn compacts the ballast and forces it down and under the tie. It is the practice to tamp each tie for a distance of about 18 in. on either side of the rail. Observations made on a railroad where new track was being raised from 2 in. to 3 in. on stone ballast showed an average of 240 ties tamped per nine-hour day, at a total cost of 2 cents per tie. One of the particular advantages in the use of pneumatic tampers is the ease with which they operate in cramped quarters such as around switches, frogs and cross-overs. These are places where hand tamping, to be well done, is a very difficult and in most cases practically impossible task.

For operating the tie tampers the manufacturer builds a special "Imperial" compressor unit in two styles, the ordinary outfit being the electric motor-driven type. This consists of a hand car mounted vertical air compressor with reservoir cooling system "short-belted" to an electric motor. Electric current is obtained from the trolley line, a suitable air receiver and piping being included. This compressor is designed to operate two tamping machines.

MOTOR-DRIVEN AIR COMPRESSOR FOR OPERATING TWO TIE TAMPERS

For operation where electric current is not available a gasoline engine-driven self-propelled unit may be used. This, except for the motor, is essentially the same as the compressor shown in the accompanying illustration. Gasoline-motor-driven units in use on the New York Central Railroad have effected an average saving of \$150 per mile of track.

While no extensive cost data are yet available covering operation on electric roads it is to be assumed that the savings effected are well worth while. The manufacturer states that track tamped with "Imperial" tie tampers will be more evenly ballasted, that the ballast will be more firmly packed and that settlement of track will be much less and far more uniform than in the case of hand work. The machines handle stone, cinder or other ballast with equal effectiveness.

In a paper read before the Engineering Section of the British Association at Manchester recently, there were described the effects of the weather on wires of various materials. The test pieces were exposed to the London atmosphere on the roof of King's College. Commercial aluminum increased its electrical resistance by 17.2 per cent in thirteen years, and during the same time copper-aluminum alloys became so corroded as to be useless and a copper-manganese alloy increased its resistance about 10 per cent. Copper-manganese-magnesium alloys increased their resistances only 9.6 per cent in four years but had become brittle, while copper-nickel and copper-zinc-nickel alloys increased their resistance somewhat.

PNEUMATIC TIE TAMPERS IN OPERATION

LONDON LETTER

**Experimental Working on the North-Eastern Railway—
Regular Service on Line This Month—Additional
Facts on Women Conductors**

(From Our Regular Correspondent)

Experimental working on the electrified portion of the North-Eastern Railway from Shildon to Newport has commenced, and it is hoped that the whole length of what is known as the Simpashire branch from Shildon to Erimus sidings, Newport, near Middlesbrough, will be opened for traffic during October. This is the first experiment in the British Isles in handling heavy freight by electrical locomotives. The system differs from that of the electrified passenger lines on Tyneside. The current is collected by the overhead system and conducted by two bows to the locomotives. Ten engines will be employed. Nine of these machines have been completed, and have made experimental runs. They have eight wheels, each pair of wheels motor driven. The cab is in the center. The locomotives were designed by Vincent Raven, the chief mechanical engineer of the North-Eastern Railway, and were built at the Darlington works. Each locomotive is capable of hauling a load of 1000 tons. The line falls slightly from Shildon to Erimus, and average loads of 1000 tons will be taken on the outward journey. The average return load will be about 575 tons. The steepest gradient on the line is 1 in 100. The electrical equipment has been designed and carried out under the supervision of Charles A. Harrison, who recently retired as chief engineer of the company. The power is supplied by the Newcastle-on-Tyne Electric Supply Company and the Cleveland and the South Durham companies, which have erected the substations.

Investigations made by municipalities lately on the subject of female labor for tramways have resulted in eliciting the fact that throughout England there are only three large towns—Liverpool, Leeds and London—which are now not employing women as conductors on tramway cars. The reports generally are to the effect that the women are doing the work in a thoroughly satisfactory manner. In Liverpool and Leeds there seems to be some local feeling against the employment of women on tramcars. In London the County Council and the other tramway authorities have no option, because the Commissioner of Metropolitan Police objects to the employment of women, and his word is law on the matter. It is probable that but for this restriction women would in some cases be acting as conductors. Perhaps an appeal may be made to the Home Office should the scarcity of male conductors increase. If permission to employ women were granted it would probably be under restrictions as to hours, because most of the cars in the Metropolitan area are very large, so that the work of collecting fares is correspondingly arduous.

The Manchester tramways committee recently gave permission to the general manager to appoint a few women as conductors, and to report on the results. Mr. McElroy has stated that the scheme is simply an experiment. In all 602 guards have enlisted, and it has become increasingly difficult to obtain the right class of men to fill their places. Men have been engaged temporarily from the ranks of those above military age or physically unfit to join the army, but these sources are almost exhausted. Many of the older guards have been at work seven days a week, and some have given up their holidays. They cannot go on any further under existing conditions. Mr. McElroy proposes to experiment with two or three women as guards. While there is no question of the ability of women to collect fares and perform similar duties, some doubt exists as to their physical endurance, especially under adverse weather conditions.

It is now some months since the experiment of employing women as tramguards in Salford was first tried. Starting with a comparatively small number of women, the Salford authorities have gradually increased the number, until now there are fifty in the service. So far the experiment has proved a success.

The Underground Railways and the London General Omnibus Companies have in course of preparation a series of illustrated booklets dealing with notable features of London and its environs. Among the twelve subjects to be

touched upon are the Tower, zoological gardens, city churches, Hyde Park, the markets and St. Albans. The first two booklets, dealing with the Tower and the zoological gardens, are ready, and may be had free of charge on application to the station masters at the Underground stations, or to the advertising manager, Electric Railway House, Broadway, Westminster, London, S. W.

All the horses of the London County Council tramways department have been disposed of, and the London County Council is abolishing the position of horse superintendent. Mr. Wilcox, who has held this office since 1903, has been transferred to the cartage department.

The Brighouse Corporation has agreed to a proposal by the Huddersfield Corporation for a postponement of the scheme whereby the latter proposed to connect its system with Brighouse and Bradford by the construction of a new line through Rastrick. It was arranged to deposit the necessary bill in the forthcoming session of Parliament, but it has since been decided by both the authorities that the scheme shall be delayed until the session of 1917.

The new trackless routes of the Mexbro' & Swinton Tramways have been inspected by the Board of Trade and formally opened for public service. The two sections extend from Mexbro' to the Manvers main colliery on the west, and to Elm Green, Conisbro', on the east. They will prove a considerable benefit to the miners who work in these localities. Each car will hold twenty-eight passengers. They have been so designed that they can run over the permanent track through Mexbro' which connects the two new sections.

Some remarkable figures showing the development of tramway traffic in Liverpool have been published recently. From Jan. 1 to Aug. 21 the receipts were £422,221 as against £443,061 last year. The passengers totaled 95,766,114, as against 94,053,741 in 1914. In reference to the anomaly of an increase of 1,712,373 passengers being coupled with a decrease of £840 in receipts, it was pointed out that 4,483,775 free journeys had been given to soldiers on duty or on furlough, to wounded soldiers and to nurses. Those journeys, at an average fare, would yield £22,745. Liverpool was the only city giving these free journeys to any great extent. So far as was known, this enormous traffic had been conducted without a complaint.

In the annual report of C. J. Spencer, general manager of the Bradford Corporation Tramways, there is a reply to the criticisms which have been offered from time to time against the trackless trolley system. Mr. Spencer contends that it is not correct to state that either a profit is being made or a loss incurred on the trackless routes in Bradford, because the feeding value, which is an important function of the car, cannot be taken into consideration in the accounts. The routes along which the cars are run are undoubtedly routes upon which tramways could not be laid without incurring heavy capital expenditure, and this method of traction was primarily adopted because of its cheapness in capital construction, and not because it was better than a tramway. He, therefore, submits that an efficient means of transit has been afforded in districts in which regular tramway service would be too costly.

The Underground Electric Railways have for some time been at work transferring the power supply of the City & South London Railway and the Central London Railway to the immense station at Lots Road, which supplies all of the other underground railways of the company. The two railways mentioned above have only recently been acquired and both had power stations of their own. Soon, however, these power houses will be discontinued, and both of the railways operated from Lots Road by means of substations.

A report has been presented to the Bristol Council from the tramways option committee regarding the option to purchase vested in the corporation which expires on Oct. 31 next. The lords of the treasury have given it as their opinion that it is not desirable, under existing conditions, that the purchase money should be raised either by the issue of stock or otherwise, and the committee recommends the Council to take advantage of a special act of Parliament passed this year and make application to the Board of Trade for an order extending for one year the period during which the corporation may exercise its option.

News of Electric Railways

STRIKE IN FORT WAYNE

Despite a Court Order the Men on the Fort Wayne City Lines Go on Strike

In the face of a temporary restraining order granted by Judge Arthur B. Anderson of the United States District Court of Indiana, enjoining labor leaders from persuading the employees of the city lines of the Fort Wayne & Northern Indiana Traction Company from violating their working agreement with the company, the men quit work shortly after midnight on Sunday, Sept. 26. Complaint was filed in the Federal Court at Indianapolis on Saturday evening, Sept. 25, by the United States Mortgage & Trust Company, New York, trustee under the mortgage of the Fort Wayne & Northern Indiana Traction Company, against Joseph C. Colgan, executive officer of the Amalgamated Association, who has been conducting the work of organizing the union at Fort Wayne, and the car service men who have signed the individual working agreement of the company, asserting that a strike was about to be called on the lines of the company in the city of Fort Wayne in violation of the contract between the company and its employees.

Judge Anderson entered an order on the showing of the United States Mortgage & Trust Company, temporarily restraining Colgan, his agents, and others who received notice of the issuance of the order, from persuading, intimidating or compelling the trainmen to leave the service of the company in a body, or in any way interfering with the operation of the cars of the company, until a hearing should be held in the United States Court on Oct. 5, at which time the court would decide whether the restraining order should be made permanent. Printed copies of the order were delivered to the employees of the company, and the order was read to Joseph C. Colgan and the members of the union at a meeting which was being held on Sunday night, Sept. 26, prior to the walkout. In spite of the order, the men failed to take out their cars Monday morning, and only about ten cars were operated in the city. About 180 car service men of the local city lines are involved in the strike, of whom about two-thirds have joined the union.

The point on which the strike was ordered, and practically the only demand made by the labor organizers, was the recognition by the company of the newly formed union. This was in violation of the "open shop" working agreement which was signed by all employees of the company on July 25, 1915, under the terms of which it was agreed that all differences arising between the company and its employees which could not be settled between them should be submitted to the Public Service Commission of Indiana, sitting as a board of arbitration. The union alleged that five men were discharged by the company for their activity in organizing the trainmen. The company had reinstated two of the men after a hearing of their cases, but refused reinstatement of three men on account of repeated violation of rules.

On the afternoon of Sept. 27, upon the showing of the United States Mortgage & Trust Company, through its attorneys, Ferdinand Winter and W. H. Latta, Indianapolis, Judge Anderson issued a citation for civil contempt against three union men identified with the strike movement. These men were ordered to appear in the United States District Court at Indianapolis on the morning of Oct. 5 to show cause why they should not pay such sums and compensation to the parties entitled to receive it as the court may find, and to answer to any other order of the court that may be made for violation of the court's restraining order.

An ordinance was passed by the City Council of Fort Wayne on Sept. 29 imposing the qualification that car crews shall have fourteen days' experience in operating cars over the streets of the city before being allowed to take out cars. The president of the Council asked the members to pass the ordinance for the avowed purpose of aiding the union to win the strike. The ordinance as passed includes a penalty of from \$5 to \$100 for each offense. The city attorney of Fort Wayne decided that the ordinance could not be made effective until Oct. 7, allowing time for publication.

Mayor Hosey requested the officials of the company to meet a committee of the union and arrange for arbitration. President J. M. Barrett of the company stated in a letter to the Mayor that harmonious relations with the men were interrupted by professional organizers who came to incite the strike and that the company had a contract with the employees which was violated when the men went out on strike under instructions from outside organizers. The employees had been required to return to work or lose their positions. Through their committee they declined to return to work. This was taken as final and the company secured other experienced and competent men to operate its cars who would continue as employees. These men were not strikebreakers, as reported. Mr. Barrett declined to agree to any board of arbitration other than the Public Service Commission. Mr. Barrett insisted on the company's legal and constitutional right to choose its employees for the operation and management of its business.

On the morning of Sept. 28, Sam W. Greenland, general manager of the company, stated that at least 65 per cent of the cars were being operated on the Fort Wayne city lines, some by the regular employees who had returned to work and others by new men who had been employed.

On Sept. 29 six cars were stopped and several of them stoned by strike sympathizers. A motorman was injured in this attack, but the arrest of three men, who were held under bond, seemed to quiet the disorder. Mr. Barrett promptly addressed a written appeal to Mayor Hosey for additional police protection and to put policemen on cars.

On Sept. 30 practically all regular cars were being operated in Fort Wayne in the day time, but operation was suspended in the evening to prevent violence. The feeling seems to prevail that the arrests following the recent disorder have had the desired chastening effect and that the company will be able to continue operating without further serious disorder from the lawless element.

FURTHERING THE PROGRESS OF THE TOLEDO FRANCHISE

A statement was filed with the City Clerk at Toledo, Ohio, on Sept. 23 by the committee of the Toledo Citizens' Franchise Association which filed the petitions for a referendum vote on the street railway franchise recently. In this case the statement is a review of the most important conditions of the franchise. It is as follows:

"To obtain municipal ownership of the street railway system any time during the twenty-five-year term of the ordinance, either by arbitration or condemnation proceedings.

"If the property is purchased, nothing shall be paid to the company on account of stocks, bonds or securities of the company, or for any franchise rights, and the remainder of the franchise term shall be surrendered by the company.

"The company must construct a cross-town line as directed, and equip the system with pay-as-you-enter or pay-as-you-leave cars.

"After the system has been rearranged the city shall, for a period of one year, direct the operation of the system. During this period the company shall give 3-cent fares by selling five tickets for 15 cents, which 3-cent rate of fare shall not be increased during the remainder of the term of the ordinance, provided the company receives a return of 6 per cent net on the appraised value of the street railway property.

"Children in arms, policemen and firemen in uniforms shall be carried free.

"Transfers for all passengers; extra transfers to or from cross-town lines.

"The city to regulate for safety and convenience of public and passengers.

"The company must pave, clean, sprinkle and keep the street car strip clear of snow.

"Provision is made for increased wages to employees of the company."

The Central Labor Union has gone on record as opposed

to the initiated franchise and has made arrangements to take part in the campaign against it.

Petitions for the submission of the franchise to a referendum vote at the regular November election have been filed with City Auditor McDonnall. They contain 22,135 signatures. This is equal to the entire vote cast at the recent primary election. The men who circulated the petitions reported to the Citizens' Franchise Association that most of those who signed expressed themselves in favor of the franchise.

The franchise has been indorsed by the City Civic Federation. W. W. Campbell, president of the Municipal Ownership League, who expressed himself in favor of the franchise at a recent meeting, appeared at the offices of the Franchise Association and offered to aid in the campaign for the franchise.

RHODE ISLAND COMPANY RESTS ITS CASE

In the arbitration hearings of the Rhode Island Company on Sept. 28 at Providence, James M. Swift, attorney for the company, rested the case of the road. It is not known when the matter will go to the arbitration board for decision, however, as a considerable number of rebuttal witnesses are to be called by the union. At this session evidence regarding an interview with W. D. Mahon, president of the Amalgamated Association, as advanced in connection with reports of the recent union convention at Rochester, N. Y., and bearing upon the fundamental importance and desirability of arbitration, was submitted. The board also allowed the admission of an address by Mr. Mahon published in the *Motor-man and Conductor*, in which the point was made that the wages of employees and the ability of companies to pay a living wage should be determined by local conditions and not by conditions existing elsewhere.

Prof. Albert S. Richey of the Worcester (Mass.) Polytechnic Institute was again on the stand at last week's hearings. He stated that in the last eight years tenement rentals had increased about 2.4 per cent. Comparisons were made of the cost of living in 1907 and 1914, taking the former year as a basis because it was the first in which the federal government issued a bulletin on the cost of foodstuffs. Professor Richey said that during this period foodstuffs had increased 22.4 per cent in price, while in 1915 there has been a reduction of 2.6 per cent from the 1914 price level. Between 1907 and 1914 clothing prices fell off 0.4 per cent, fuel prices rose 9.8 per cent, and lighting prices fell off 24.8 per cent. The witness testified that as a whole the cost of living in 1915 was 10.4 per cent more than in 1907, but that in 1914 it was 12.1 per cent more than in 1907. With the exception of clothing, these figures applied to retail prices. The weighted average of the principal items used in reaching the estimated result was as follows: food, 51.13 per cent; rent, 26.2 per cent; clothing, 16.4 per cent; fuel, 4.68 per cent; lighting, 1.59 per cent. Yearly wages have increased on the average 19.3 per cent, or 8.9 per cent more than the increased cost of living to 1915 inclusive. It was brought out that motormen and conductors on the Boston Elevated Railway received 3 cents a day more than at Providence and worked one hour less a day than men in the latter company. For 1914 the Rhode Island Company paid 8.5 per cent of its operating revenue in taxes, whereas ten Massachusetts companies paid 6.2 per cent of their revenue. In 1915 the Rhode Island Company was obliged to pay 9.3 per cent in taxes.

A. E. Potter, president of the company, also testified that in the last year the company had run all-night cars at a cost of \$49,000, on account of the franchise agreement. The cars did not pay. Among the data sheets filed at the hearing was a list of union employees who have testified at the proceedings, giving the wages and days off duty of each man for the year ending July 2, 1915. The wages varied from \$396.05 to \$1,320.30, and included forty-eight regular men and one spare man. Of these thirty-two earned more than \$700 a year, seventeen earned more than \$800, eight earned more than \$900, and three more than \$1,000. Only six earned less than \$600. The days off, excluding Sundays and holidays, for those normally working a six-day week, varied in the table from none to seventy-eight. Mr. Potter said that the company really furnished taxicab service for a nickel as a result of the headway limitations enforced by the franchise. The night service cost the company al-

most 21 cents per car-mile. The company was obliged to forego the building of a new carhouse near the Pawtucket city line this year at a cost of \$300,000.

ANOTHER SUBWAY COLLAPSE IN NEW YORK

The second accident within a few days occurred on subway construction work in New York at Thirty-eighth Street and Broadway on Saturday evening, Sept. 25, just before the theater crowds were beginning to drift in toward Times Square. The planking over the excavation for the new Broadway subway on the west side of that thoroughfare at Thirty-eighth Street collapsed without warning, leaving a hole about 100 ft. long, 30 ft. deep and extending from the street car tracks halfway across the width of the pavement. A taxicab standing in the street was carried down with the planking. One woman was killed and three men were badly hurt. A street car which was approaching the point of the accident had a narrow escape from being precipitated into the subway cut. The accident is unofficially ascribed to a rock slide under the sidewalk at the edge of the cut.

As a result of the accidents Mayor Mitchel has appointed a committee of twelve engineers to conduct an inquiry in co-operation with him and other city officials, with Commissioner of Accounts Walstein in general charge.

The Public Service Commission has retained a number of outside engineers to examine the cut and cover work in New York, report on its safety, and recommend means to prevent further disaster.

Much of the traffic that had been blocked by recent accidents in the construction work of the new subways was restored on Sept. 28. Longitudinal traffic was opened between Thirty-first and Thirty-fourth Streets. Broadway at Twenty-seventh and Twenty-eighth Streets was opened at night, and the crossing of Broadway and Twenty-ninth Street was opened before the rush hour on Sept. 29. This permitted the resumption of crosstown traffic on Twenty-eighth and Twenty-ninth Streets, including operation of the crosstown car lines. Seventh Avenue was opened to north and south traffic from Sixteenth to Twenty-third Street in the afternoon, and from Twenty-seventh to Thirty-first Street at night on Sept. 29. The Mayor's committee and the engineers of the Public Service Commission are considering what ought to be done on Broadway, between Thirty-fifth and Fortieth Streets. Meanwhile Police Commission Woods has issued a statement assuring the public that there never has been any question as to the security of the foundations of buildings in the shopping district of elsewhere.

B. R. T. AND INTERBOROUGH PLAY A TIE

The all-star team of employees of the Brooklyn (N. Y.) Rapid Transit Company and the team from the shops of the Interborough Rapid Transit Company, the champions of the Interborough Rapid Transit League, met in a ball game at Ebbett's field on the afternoon of Sept. 29. They played to a deadlock of six all, the game being called in the tenth inning on account of darkness. H. Tobin started the game for the Interborough team, but he gave way to Wood in the seventh inning after a pinch hitter had batted for him in the sixth. Deutsch, a port-sider, started the game for the Brooklyn Rapid Transit team. Five hits off him in the third inning for a total of four runs drove him to the clubhouse. Schroeder succeeded him and allowed only five hits up to the tenth inning. The Interborough team made thirteen hits as against ten hits for the Brooklyn Rapid Transit team. The fielding feature of the game was a one-handed catch off first base by Smith of Brooklyn, while the batting feature of the game was a home run along the third base line by an Interborough man in the third inning.

The game was staged like a regular league contest. The score board used by the Brooklyn National League team was employed to show the balls, strikes, outs and score by innings. About 7500 people witnessed the game, among them many ladies. The B. R. T. contingent was carried to the field in special cars. Music was furnished by both the Brooklyn Rapid Transit Band and the band of the Interborough Rapid Transit Company. The rivalry between the teams is extremely keen. At the game were many of the officers and department heads of the companies.

Cleveland Municipal Ownership Proposal Rejected.—The City Council of Cleveland has voted down the ordinance providing for the issue of bonds for the purchase of the Cleveland Railway. Councilman W. J. Reynolds is urging Council to have a complete transportation survey of the city made.

New Elevated Extension Opened in Brooklyn.—The Liberty Avenue extension of the Fulton Street elevated line of the Brooklyn (N. Y.) Rapid Transit Company was opened on the afternoon of Sept. 25. Lefferts Avenue will be the terminus of the line until further extensions are opened on the way to Jamaica.

Ohio Roads Denied Reduction in Tax Valuation.—The Ohio Tax Commission has declined to make any reduction in the valuations of the Cincinnati Traction Company, the Ohio Traction Company and the Columbus interurban station property. The request of the Ohio Electric Railway for a reduction of about \$3,000,000 in its valuation has not been passed upon.

Briefs Filed in Missouri Right-of-Way Case.—Judge E. E. Porterfield of the Jackson County Circuit Court has received the final brief, the answer to the response of plaintiff to the brief of defendants in the application for the rehearing of the suit of the Interstate Railway against the Kansas City, Clay County & St. Joseph Railway. He probably will take a month to consider the case before rendering a decision. This is the case in which damages of \$1,500,000 were awarded for alleged usurpation of right-of-way.

Massachusetts Companies to File Contracts.—The Massachusetts Public Service Commission has requested all street railways within its jurisdiction to file with the secretary of the board copies of all contracts relative to the purchase of power and of all agreements relative to the use of tracks or rolling stock, management, construction or maintenance work, between any company and any other street railway. Contracts for supplies are also to be filed, except where the volume of purchases does not exceed \$5,000.

Wage Concessions Awarded by London Conciliation Board.—The claims of the London (England) County Council tramwaymen have been dealt with by the Conciliation Board, which grants various concessions worth £58,300 per annum. The demands for an extra 1s. a day, a fortnight's holiday, and the reduction of the hours of labor to eight a day are refused. As the finance committee of the Council states, the result of this award is to place a heavy additional charge on the tramways undertaking. The award has been accepted by the men by ballot.

Newport Franchise Ultimatum.—The Commissioners of Newport, Ky., have passed an ordinance fixing the rental charge for the use of the streets at \$1,000 a year per mile of track until such time as the Cincinnati, Covington & Newport Railway secures a definite franchise to take the place of one alleged to have expired. This amount is to be paid in monthly installments with interest at the rate of 6 per cent on all deferred payments. The Business Men's Club endeavored to settle the difference between the city and the company, but so far no results have been reached. The company offered to accept a franchise with a rental of \$3,000 a year for the use of the streets, but fixed that as the maximum.

No Suitable Signals for New York Elevated.—The Interborough Rapid Transit Company has notified the Public Service Commission for the First District of New York that its engineers have been unable to discover "on the market or in process of development" a system of signals for use on the elevated railroads which would give the maximum of safety without reducing the capacity of the roads. Last April the commission adopted a resolution directing the company to place such a system in trial operation not later than Oct. 1, 1915. The company now asks for an extension of at least six months in which to begin the experiment. Without acting upon the request for extension, the commission directed that a hearing be held on the matter on Oct. 1, 1915.

New Haven Conspiracy Trials This Month.—William Rockefeller and his associates in the directorate of the New York, New Haven & Hartford Railroad will face trial in the United States Courts at New York on Oct. 13 on the

indictment found by the Federal Grand Jury last November, accusing them of a criminal conspiracy under the Sherman law. The date was set on Sept. 27 by United States Circuit Judge Hunt at the close of a session of the court at which efforts were made to secure separate trials for Lewis Cass Ledyard, Charles M. Pratt, Henry K. McHarg, Frederick F. Brewster and Alexander Cochrane. They asked to be put in the same class as George F. Baker, T. N. Vail, T. de Witt Cuyler, Edward Milligan and F. T. Maxwell.

Atlanta Paving Dispute Before Court.—Litigation between the city and the Georgia Railway & Power Company, Atlanta, Ga., is still going on in the courts over a city ordinance which requires the company to lay a concrete base for its tracks wherever the city is putting down a permanent pavement. Soon after the ordinance was passed the city attempted to enforce it by blocking up Grant Street when the company refused to concrete the track base on that street. The company then enjoined the city from blocking the street. A hearing on a permanent injunction preventing the city from interfering with the company's track construction will come up soon in the Superior Court. The company claims that crushed stone is a better base for tracks than concrete.

Combined Auto and Railway Service in Seattle.—The City Council of Seattle, Wash., has disregarded Mayor Gill's veto and has passed a bill authorizing the Board of Public Works to enter into a contract with F. M. Peterson to establish an auto bus service from the north terminus of Division "A" of the Municipal Railway to points in Ballard. Under the contract, passengers who ride on Division "A" may obtain transfers to the motor bus at Thirteenth Avenue and Nickerson Street, the north terminus, and ride into Ballard. Passengers also may board the jitney at Ballard and transfer to the municipal railways. The city will allow the operator of the auto bus 3 cents on every transfer for adults and 1¼ cents for school children. The franchise granted to Mr. Peterson is not an exclusive one. It is understood that several large motor buses will be put into operation at once.

Gulf Storm Suspends Street Car Service in New Orleans.—The property of the New Orleans Railway & Light Company, New Orleans, La., suffered from the destructive hurricane which swept up the Gulf Coast on Sept. 28 and 29. At the New York office of the United Gas & Electric Engineering Corporation, which acts as operating engineer for the New Orleans property, B. F. Wood, chief engineer, stated on Oct. 1 that the engineering company had been unable to get into any wire communication with the officials in New Orleans, but had received the following wireless message via Mobile, Ala., sent from New Orleans on Sept. 30, by S. J. Dill, a vice-president of the engineering corporation: "Severe hurricane New Orleans Wednesday. Considerable property damage. Electric and street railway service badly crippled account poles and trees down. Cleiborne, Canal and Prytania barns damaged. Clearing up lines fast as possible. Cannot give estimate of property damage. Also considerable damage to consumers' idle power house."

Agreement on Extensions in Tacoma Likely.—It is reported that an agreement will probably be reached between the city of Tacoma, Wash., and the Tacoma Railway & Power Company by which the company will extend the Pacific Avenue line to Forty-sixth Street, making connections between the Tacoma Avenue and Point Defiance lines, this in return for the use of the Tacoma Avenue fill for the South Tacoma line and a physical connection between the municipal power plant at La Grande and the Tacoma Railway & Power Company's plant at Electron. It is understood the point upon which the transaction hinges is the rate to be charged in the exchange of current in case either plant should be disabled. The construction of the South Tacoma line over the Tacoma Avenue fill would eliminate a dangerous curve and grade on one of the most heavily patronized lines in the city and shorten the time between South Tacoma and the business section of the city. It would also permit the routing of cars direct between South Tacoma, American Lake and Point Defiance. The Pacific Avenue extension has been desired for some time, as it will provide transportation for a large residence district south of the present terminus of the Pacific Avenue line at South Thirty-fourth Street.

Financial and Corporate

SECURITIES OWNED BY METROPOLITAN LIFE

Annual Report Shows Comparative Holdings of Electric Railway, Steam Railroad, Municipal and Other Securities

The latest annual report of the Metropolitan Life Insurance Company, New York, N. Y., for the year ended Dec. 31, 1914, contains an unusual summary showing the detailed security holdings of that corporation. On the above-mentioned date, the company owned \$204,790,794 of bonds and \$5,423,826 of stocks. This total for bond holdings was made up of the following items: municipal bonds, \$21,444,694; steam railroad bonds, \$123,220,922; electric railway bonds, \$25,218,845, and bonds of other public utilities, \$34,906,333. The stock holdings comprised \$3,086,052 of bank stock, \$1,034,500 of electric railway stock, \$986,945 of steam railway stock, \$194,480 of other public utility stock and \$121,848 of industrial stock.

The bond and stock holdings were both widely diversified as to location, thus affording an excellent example of how a large investing corporation follows out one of the cardinal principles of investment in minimizing the bad effects of local business disturbances. Moreover the distribution of the securities among the several fields was almost as might be anticipated, the only surprising feature being the way electric railway bonds and other public utility bonds outranked municipal bonds in popularity. At first glance one may wonder why the total of steam railroad bonds is so high, but when he considers that the insurance company began business in 1867 and that electric railways and similar utilities are relatively infant industries as compared to the steam railroad business, the comparatively high investment in steam railroad funded obligations is not difficult to understand. It is interesting to note that electric railway stocks are considered to rank next to bank stocks in the possession of non-speculative attributes.

DIVIDEND REDUCTION IN HARRISBURG

Cut Largely Caused by Decrease in Earning Brought About by Jitney Competition

The Harrisburg (Pa.) Railways has announced that the semi-annual dividend on the preferred stock of the company will be 1 per cent, payable on Oct. 1, as compared with the last semi-annual dividend of 2½ per cent. The Harrisburg Railways preferred stock was issued to be a 5 per cent cumulative stock until this year, when it became a 6 per cent cumulative stock. The payment for the half year just closed makes a total of 3½ per cent for the last twelve months.

Frank B. Musser, president and general manager of the company, is quoted as follows:

"The jitneys are largely responsible for the decrease in our earnings. The falling off in passenger traffic cannot be ascertained until the work for the year is gone over, but we can tell from the ordinary receipts that there is a big drop in the city lines, convincing us that it is caused by the jitney service. The jitneys do not go out of the city, confining their operations to the more prescribed city limits."

F. M. Davis, superintendent of transportation of the company, is reported to have said:

"Whenever we arranged for something big at Paxtang, the rain interfered and prevented a large attendance, and there was a corresponding loss. But the largest cutting in on the receipts was by the jitneys. Then, again, the increase in the number of automobiles, not in the jitney service, has had something to do this summer with reducing receipts. Formerly it was the custom of a man to take his entire family for a trolley ride in the summer evenings, but now he owns an auto and takes the family out for a ride in that.

"This, however, is not the first ordeal the street railway has gone through in the way of reduction of receipts. When the bicycle craze started some years ago and reached the high mark, the street railway receipts were materially reduced, but the bicycle has had its day."

ANNUAL REPORT

American Water Works & Electric Company, Inc.

The first annual statement of income, profit and loss of the American Water Works & Electric Company, Inc., New York, N. Y., for the year ended June 30, 1915, follows:

Company's proportion of net earnings of subsidiary companies (exclusive of West Penn Traction Company)	\$646,012
Income from bonds and preferred stocks owned, interest on bank balances, etc.....	348,462
Total gross income.....	\$994,475
Expenses and taxes—less proportion contributed by subsidiary companies for expenses of administration and included in the operating expenses of such companies	48,353
Net earnings	\$946,122
Deductions	467,484
Net income	\$478,638
Net income, April 27, 1914, to June 30, 1914.....	89,969
Total credits	\$568,607
Deduct special funds to be set aside under terms of supplemental mortgage	519,455
Credit balance remaining June 30, 1915.....	\$49,152

With the exception of minor amounts actually received as dividends on preferred stock of some of the West Penn Traction properties around Pittsburgh, Pa., the foregoing figures do not include any earnings from those companies, as such earnings are not immediately available for the American Water Works & Electric Company, the cash equivalent having been used for construction purposes. Had the American Water Works & Electric Company's proportion of these earnings been included, the net earnings would have been increased about \$232,000 and would have been approximately \$1,178,122.

While the earnings for the year ended April 30, 1915, (comparisons at June 30 not being available) do not show so large an increase as previous years, they do show an increase even under the very unfavorable general business conditions which prevailed during the last year. Owing to the business depression in the Pittsburgh district, the earnings of the West Penn Traction properties were not so large as had been anticipated. In addition to this, the net income was adversely affected by the interest charges on the new money provided for a large amount of construction work, the benefits of which were reflected in the earnings to only a limited extent. The recent statements, however, show decided improvement, and with the return of normal conditions it is expected that large and increasing earnings will accrue to the American Water Works & Electric Company from its holdings of the securities of the West Penn Traction properties.

The annual report contains the following statistics relative to the West Penn Traction properties: Miles of road owned, 317.04 miles; miles of power lines (25,000 volt transmission lines)—poles miles, 396.56 miles, and wire miles, 552.71 miles; number of cities and communities served, 170; number of consumers, 23,345, and kilowatt-hour output, 154,973,930 kw.-hr.

THIRD AVENUE BOND DELAY

A statement by the Third Avenue Railway, New York, N. Y., relative to the delay in authorization of the remaining \$2,650,000 of the original \$6,650,000 bond issue applied for on Dec. 23, 1913, is at variance with a recent announcement made by the Public Service Commission for the First District of New York. The commission stated that while it had authorized on Feb. 20, 1914, \$4,000,000 of 4 per cent bonds to cover expenditures occasioned by the acquisition of the New York City Interborough Railway and the Belt Line Railway Corporation, the remaining \$2,650,000 applied for is still under investigation, as the amount asked for is to replace expenditures on plants. The commission asserted that the delay was occasioned by reason of the Third Avenue Railway's failure to comply with an order issued several years ago, requiring all corporations to file monthly statements of expenditures against capital accounts.

The Third Avenue Railway now states that its petition for approval of \$6,650,000 of bonds was filed on Dec. 23, 1913, and covered expenditures for capital account from Jan. 1, 1912, to Oct. 31, 1913. The petition was amended from

time to time to cover expenditures for capital account up to Feb. 28, 1915. On Oct. 31, 1913, the commission issued a circular letter suggesting that all companies make periodical reports of expenditures against which they might later ask the approval of the commission for the issue of bonds. This has never been put in the form of an order, and no definite form of report has been suggested by the commission.

The railway, however, acknowledged the receipt of this circular letter and stated that it was the intention of the company to make such reports. Before it was possible to prepare the reports in question the application was made and the books and records were thrown open to the accountants and engineers of the commission for investigation. It then seemed that any reports of this nature would be superfluous and the matter was dropped pending the action of the commission on the application. In the present case the commission is considering expenditures made during a period of twenty-two months prior to the date of its suggestion as to the reports and during a period of sixteen months subsequent thereto. It is said, therefore, that the delay, if any, in acting on the application cannot be charged to the lack of these reports. In the latest annual report of the company, President Whitridge stated that he was informed that a final decision in this case might be expected in the near future.

BIRMINGHAM REORGANIZATION PLAN ADOPTED

Committee of Bondholders Approves Plan Based on Procuring of Guaranty for Bonds—Alternative Plan Is Submitted

The committee of bondholders of the Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala., of which S. H. Cunningham is chairman, has adopted the plan of reorganization submitted by the committee headed by Charles H. Zehnder, and has given notice that it will allow dissenting depositors until Oct. 25 in which to withdraw. In the event that it is possible to procure a guaranty of the principal and interest of an issue of bonds such as is desired, the proposed new company to be created after the foreclosure sale will be organized with \$4,000,000 of bonds, \$1,060,000 of preferred stock and \$1,590,000 of common stock. Of the \$4,000,000 of first mortgage 5 per cent thirty-year gold bonds covering all the property \$1,500,000 is to be issued at once. The bonds are to be dated and to bear interest from Jan. 1, 1916, but are to be redeemable at the option of the company on any interest date at 101 and interest. The \$1,060,000 of preferred stock is to be a non-cumulative issue and is to have equal voting power with the common stock. The preferred and common issues are at present limited to the foregoing figures.

Holders of deposited first mortgage 5 per cent bonds of the present company will receive 50 per cent of the principal amount of their bonds in bonds of the new company, amounting to about \$1,262,650. The remaining \$237,350 of bonds presently to be issued will be sold for cash. The balance of the authorized issue of bonds will be reserved for betterments and additions, new equipment, etc., at 85 per cent of the cost of the same. The new stock issue will be delivered to the guarantor of the bonds as a consideration for such guaranty, any part not so used to go into the treasury of the company. The cash arising from the sale of the \$237,350 of bonds will be applied to the payment of any part of the purchase price of the properties required to be paid in cash, to the expenses, disbursements and compensation of the committee and all other expenses incident to the reorganization. Any balance will be placed in the treasury of the new company.

An alternate plan or reorganization provides for a new company with the same share capital as previously mentioned, but in this case the first mortgage thirty-year, 5 per cent bonds are to be for the authorized principal sum of \$1,000,000, dated Jan. 1, 1916, the present issue of which is not to exceed \$250,000. In this case the \$250,000 of bonds are to be sold for cash at such prices as the committee may approve to meet the expenses of the reorganization, the balance being reserved for betterments, etc. In such a case the entire authorized stock is to be deposited with voting trustees for five years. The voting trust certificates would be distributed among the holders of the deposited present

first mortgage 5's, 50 per cent of the face amount of the bonds to be exchanged for preferred voting trust certificates and 60 per cent for common voting trust certificates, thus calling for \$1,009,120 and \$1,515,180 thereof respectively. Any balance would be turned over to the treasury of the new company. Depositors under the Sept. 15, 1914, agreement must waive the right to exchange \$700 of new bonds for \$1,000 of old bonds.

Aurora, Elgin & Chicago Railroad, Wheaton, Ill.—The Aurora, Elgin & Chicago Railroad has decided to omit the usual quarterly dividend of 1½ per cent on the \$3,100,000 of 6 per cent cumulative preferred stock. Regular payments have been made on the stock since July, 1906. E. C. Faber, vice-president and general manager of the company, is quoted as follows: "Directors and officers unanimously and formally decided that on account of the depressive effect of the European war on the company's business the company's best interests would be conserved by taking no action on the preferred dividends at this time." The depression in the Chicago industrial district, increased use of automobiles by former regular patrons and rainy Saturdays, Sundays and holidays all contributed to the reduced earnings.

British Columbia Electric Railway, Ltd., Vancouver, B. C.—The report of traffic for the first eight months of the year over the Vancouver city lines owned by the British Columbia Electric Railway shows a decrease of nearly 10,000,000 passengers as compared with the record for the corresponding period of last year. The company's percentage payments to the city for the period show a decrease of nearly \$25,000 as compared with last year. The number of passengers carried on the city and suburban lines during August was 2,357,102, as compared with 3,368,572 for August of last year. The city's percentage check on the August traffic was \$3,251, as compared with \$6,956 a year ago.

Columbus, Delaware & Marion Railway, Columbus, Ohio.—The report of operation of the Columbus, Delaware & Marion Railway to the Common Pleas Court for the year ended June 30 shows the net operating income was \$160,922, the operating revenue being \$295,335. Eli M. West, receiver, states that his salary and attorneys' fees were included this year, whereas they were formerly made separate items. Improvements amounting to \$40,000 were made. Mr. West says that the showing would have been much better had it not been for unseasonable weather, business depression and an increase in the number of automobiles used.

Denver & Northwestern Railway, Denver, Col.—The directors of the Denver & Northwestern Railway, which is the holding company for the Denver Tramway, have passed the usual quarterly dividend of one-half of 1 per cent. This payment, it is said, was discontinued in the best interests of the company and the interests as well of its stock and bond holders.

Elmira Water, Light & Railroad Company, Elmira, N. Y.—The regular dividends on the first 7 per cent cumulative preferred and the second cumulative 5 per cent preferred stock of the Elmira Water, Light & Railroad Company have been declared, but no dividend has been declared on the common stock.

Memphis (Tenn.) Street Railway.—The Memphis Street Railway has sold on a when-issued basis an issue of \$1,500,000 of two-year 6 per cent collateral gold notes to a syndicate composed of Bertron, Griscom & Company, Reilly, Brock & Company, Philadelphia, and Counselman & Company, Chicago. The company has also sold to the first two houses named an issue of \$600,000 of one-year 5 per cent guaranteed notes. Both issues are to be dated Nov. 1, 1915.

New York (N. Y.) Railways.—The arbitration committee appointed to fix the amount of interest to be paid on the New York Railways 5 per cent adjustment income bonds for the six months ended June 30, 1915, declared on Sept. 30 that 1.37 per cent would be an equitable payment. This interest compares with 1.288 per cent for the corresponding period last year, an increase of 0.82 per cent. The payment for the last six months of 1914 was 1.769 per cent.

Northern Electric Railway, Chico, Cal.—The reorganization agreement of the Northern Electric Railway, in addition to being agreed to by all the creditors' representatives, has been signed by all parties in interest, including the several constituent railways, the Sloss interests and certain San

Francisco banking institutions. The holders have been asked to deposit securities and claims with the Union Trust Company or the First Federal Trust Company, San Francisco, depositaries.

Philadelphia & Western Railway, Upper Darby, Pa.—As announced in the *ELECTRIC RAILWAY JOURNAL* of Sept. 18, 75 per cent of the stockholders of the Phoenixville, Valley Forge & Strafford Electric Railway recently agreed to the sale of the company to the Philadelphia & Western Railway. Official advices from the latter company now state that fast through electric car service between Philadelphia, Valley Forge, Phoenixville, Spring City and Pottstown is probable within a year, the Philadelphia & Western Railway to form the terminal trunk line but to take no part in financing the plan. There has been no sale of the property to the Philadelphia & Western Railway. The plan contemplates a 7-mile extension of the Phoenixville, Valley Forge & Stafford Electric Railway to a connection with the Philadelphia & Western Railway at Bridgeport. This work and new cars such as the Philadelphia & Western Railway would be willing to attach to its trains will cost, as estimated, about \$300,000. The Phoenixville, Valley Forge & Strafford Electric Railway now runs 4½ miles from Valley Forge to Phoenixville. From there the Pottstown & Phoenixville Railway now operates 25 miles in two sections, one from Pottstown to Sanatoga, the other from Spring City to Phoenixville. The gap from Sanatoga to Spring City is now being filled in by a new line under construction and largely graded. With these lines joined up new fast electric service will be provided through a territory inhabited by about 40,000 persons, affording Philadelphia easier access from towns 30 miles up the Schuylkill River and giving a frequent service out to Valley Forge Park.

Tennessee Railway, Light & Power Company, Nashville, Tenn.—The \$2,500,000 note of the Tennessee Railway, Light & Power Company, due on June 22, 1915, was paid at maturity. To finance this payment there was sold by E. W. Clark & Company, Philadelphia, Pa., \$2,500,000 of one-year 6 per cent secured note participating receipts dated on June 22, 1915, and due on June 22, 1916, interest payable quarterly on Sept. 22. The participating receipts are issued by the Guaranty Trust Company, New York, N. Y., and certify that the holder is entitled to a certain interest in a one-year 6 per cent promissory note for \$2,500,000 executed by the Tennessee Railway, Light & Power Company and secured by pledge of \$2,500,000 of Nashville Railway & Light Company common stock, paying 4 per cent, and \$2,500,000 of Tennessee Power Company first mortgage 5 per cent gold bonds. These securities represent an investment on the part of the Tennessee Railway, Light & Power Company of more than \$5,000,000, and the income received from them is 50 per cent greater than the interest on the notes.

Trinidad Electric Company, Ltd., Port of Spain, Trinidad.—The directors of the Trinidad Electric Company, Ltd., have passed the usual quarterly dividend of 1¼ per cent. Heretofore this rate has been maintained for many years.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—The property of the Buffalo & Susquehanna Railway between Wellsville and Buffalo, on which W. R. Page, president Western New York & Pennsylvania Traction Company, had an option, was recently sold at foreclosure to M. G. Bogue, representing the bondholders' committee. It is officially stated, however, that this sale will not interfere with the option that was given on the property.

DIVIDENDS DECLARED

Asheville Power & Light Company, Asheville, N. C., quarterly, 1¼ per cent, preferred.

Athens Railway & Electric Company, Athens, Ga., quarterly, 1¼ per cent, preferred.

Carolina Power & Light Company, Raleigh, N. C., quarterly, 1¼ per cent, preferred.

Chicago (Ill.) City Railway, quarterly, 2 per cent.

Cincinnati (Ohio) Street Railway, quarterly, 1½ per cent.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Columbus, Newark & Zanesville Railway, Columbus, Ohio, quarterly, 1¼ per cent, preferred.

Elmira Water, Light & Railroad Company, Elmira, N. Y., quarterly, 1¼ per cent, first preferred; quarterly, 1¼ per cent, second preferred.

Honolulu (Hawaii) Rapid Transit & Land Company, quarterly, 2 per cent.

Houghton County Traction Company, Houghton, Mich., 3 per cent, preferred.

Omaha & Council Bluffs Street Railway, Omaha, Neb., quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Ottawa (Ont.) Traction Company, quarterly, 1 per cent.

Porto Rico Railways, San Juan, Porto Rico, quarterly, 1¼ per cent, preferred.

Public Service Corporation of New Jersey, Newark, N. J., quarterly, 1½ per cent.

Puget Sound Traction, Light & Power Company, Seattle, Wash., quarterly, 75 cents, preferred.

Tidewater Power Company, Wilmington, N. C., 3¼ per cent, common.

Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., quarterly, 1½ per cent, preferred.

Western Ohio Railway, Lima, Ohio, quarterly, 1¼ per cent, first preferred.

Winnipeg (Man.) Electric Railway, quarterly, 2½ per cent.

Traffic and Transportation

JITNEY JOTTINGS

New York's Jitney Law Sustained by Supreme Court— Richmond Company Suspends Jitney Service

With the filing in the Albany County Clerk's office on Sept. 27 of an order by Supreme Court Justice Hasbrouck the Public Service Commission of the Second District of New York finds the so-called jitney bus law sustained in all its principal phases. As the result of the decision, rendered on Sept. 27, the courts in this and other cases have held that the following classes of vehicles must secure the consent of local authorities and come to the commission under the new law for a certificate of public convenience and necessity, namely: (a) A bus line. (b) A stage route. (c) A motor-vehicle line or route. (d) A vehicle in connection with a bus line, a stage route, a motor-vehicle line or route. (e) A vehicle carrying passengers at a rate of fare of 15 cents or less for each passenger within the limits of a city. (f) A vehicle carrying passengers in competition with another common carrier which is required by law to obtain the consent of the local authorities of said city to operate over the streets thereof.

This classification was made by Supreme Court Justice Brown in a case in the Niagara County Supreme Court wherein Burt G. Hurtgam was restrained from operating a bus line from Lockport to Olcott Beach, though he charged a fare of 50 cents and only part of his line was within the city of Lockport. The result of this decision was to make practically all operators of bus lines in the cities of the State liable to procedure under the penalty clause of the public service commissions law unless they secure the permission of the city authorities and the certificate of the Public Service Commission.

In Justice Hasbrouck's decision, filed on Sept. 27, he holds that in the case of Elmer G. Booth, Rochester, the license of the city of Rochester, granted Booth before this law took effect, does not relieve Booth from the necessity of getting the consents of the city authorities under the new law and of coming to the Public Service Commission. The court says: "The license, being the child of the statute and not of the nature of a contract nor of a class known as vested rights, is susceptible of revocation or annulment at any time by the creating power" (the Legislature).

This decision will compel all of the many Rochester jitney owners to conform to the new law, whether or not they possess an old public-vehicle license from the city.

The Public Service Commission for the Second District of New York has permitted the Troy Auto Car Company to renew its application for a certificate of convenience and necessity under the jitney law for its bus line in Troy and Lansingburgh. The petitioning company has amended its certificate of incorporation and says it wishes to proceed with the application, which was opposed by the street railway employees of Troy.

Frederick B. Hemingway, Allen Brothers and Irving K. Weed have discontinued the operation of the jitney bus line they were alleged to be running in competition with the Poughkeepsie City & Wappingers Falls Electric Railway. The Public Service Commission has permitted the company to withdraw the application it had made to the commission for permission to sue the jitney operators under the recently enacted jitney bus law.

Complaint by the jitney owners of Philadelphia who were forced to discontinue their business because of Council's ordinance of July 2 was again heard by the Common Pleas Court, this time by Judges Audenried, Carr and Finletter, Court No. 4. Argument was heard for and against the demurrer of City Solicitor Ryan to the bill in equity filed by the Union Motor Bus Company against the city authorities to restrain them from enforcing the ordinance. Assistant City Solicitor Wolf supported the demurrer by contending that the complainant's bill did not advance sufficient reasons for having the ordinance declared unconstitutional, nor did the bill point out the extent of the injury alleged to be worked the jitney owners by the ordinance. The fact that a number of automobiles were purchased by some of the complainants on the installment plan, and that the en-

forcement of the ordinance prohibited them from earning sufficient money to keep up the payments as they became due, did not show, according to Mr. Wolf, the necessity for equitable intervention by the court. Mr. Wolf said the ordinance did not discriminate against the jitneys and in favor of the taxicabs as alleged in the bill. He also said that the right to operate a jitney was a concession granted by Councils with the authority of the Legislature, and therefore Councils had the right to restrict their operations. Decision was reserved.

Under the guise of the People's Motor Club, the jitney men of Philadelphia, Pa., think they see a way under the so-called membership plan of operating without paying a license or putting up the required \$2,500 bond. All that is necessary now to become a member of the club and enjoy its privileges is to pay 25 cents "dues." This payment carries with it a strip of five tickets, which are each good for a jitney ride. The headquarters of the club are in the Parkway Building. It is a small office. There President Paul Randolph and a young woman were busy recently selling tickets to new "members" and in registering drivers who wish to "hire" their cars to the club.

The Motor Transit Company, a subsidiary of the Virginia Railway & Power Company, Richmond, Va., has announced that it will discontinue operation of its jitney cars. In its formal announcement the Motor Transit Company states that it has lost in actual operation more than \$700 a month, without providing for interest and depreciation, which amount to more than \$15,000 additional. It is impossible, the company states, to operate cars on a 5-cent fare without heavy and increasing loss, and the company is therefore forced to abandon its motor service.

The City Council of East Liverpool, Ohio, has passed the jitney ordinance on final reading and the measure is now before the Mayor for signature. The new measure contains but few changes from the original draft. Instead of making the city license \$10 as before, the new measure taxes the jitney owners \$25 annually to operate. This tax will be paid into a fund for the improvement of streets, according to the second measure, which differs from the first in that it stated that such money should be paid to the general fund. Another section which makes the latter ordinance differ from the first is the section requiring all owners to provide a \$5,000 bond, which may be furnished by another party. At the request of Councilman Horton this clause was made to read that only a reliable bonding house would be accepted as legal in order to operate the buses.

Standing by his former decision in the jitney ordinance suit, in Portland, Ore., Circuit Judge Bagley states that he still firmly believes that the City Council has no authority to stop the referendum by attaching an emergency clause to an ordinance. Pending an appeal to the Supreme Court, the city of Portland was enjoined from enforcing the ordinance regulating jitneys. A decision is expected in the Supreme Court within a month.

Two injunction suits filed in the Sixty-eighth District Court against the city of Dallas, Tex., seeking to prevent the operation of the jitney ordinance have been dismissed for want of prosecution.

A new ordinance, passed by the Common Council of Jamestown, N. Y., authorizes the operation of jitney bus lines under modified restrictions from those at first proposed which were held to be prohibitive. The new ordinance reduces the license fee to \$10 and \$20 for the two size cars, and the indemnity bond from \$10,000 to \$1,000 for the small car, and \$2,000 for the large car.

The Pacific Coast Casualty Company, which has been doing practically all the jitney bus bonding business in the State of Washington under the 1915 bonding law, has notified H. O. Fishback, state insurance commissioner, and I. M. Howell, Secretary of State, that it has temporarily discontinued doing jitney bus bonding business. This action is taken, it is understood, in order to permit the consolidation of a number of companies. In the meantime the jitney bus operators are finding it difficult to secure bonds required by the state law.

The Auto Bus Protective Association of Ohio was organized at Youngstown on Sept. 24. This is intended as a State organization, composed of representatives of various local associations. The next meeting, it is said, will be held in Columbus.

PUBLIC SCHOOL SAFETY WORK IN BROOKLYN

Summary of Report for Year—Crusade to Continue—New Plans Made for Coming Year

George W. Wingate, president of the Brooklyn Institute for Safety, has submitted a report of the activities of the institution during the public school year of 1914-1915, together with the work in the vacation schools and playgrounds during the summer term of 1915. The fiscal year of the Brooklyn Institution for Safety, beginning on Oct. 1, brings the inauguration of each year's work of the institution into accord with the approximate date of the opening of the schools in the fall and enables the work of the regular school year and of the summer term in the vacation schools to be considered together. The Brooklyn Institution for Safety holds the permission of the Board of Education of the city of New York to conduct public safety instruction in the public schools. This activity has been delegated by the institution to the bureau of public safety of the Brooklyn Rapid Transit Company, which has maintained a lecturing staff and carried out such instruction with the approval and under supervision of the directors of the Brooklyn Institution for Safety.

During the regular session of the public schools ending in June last, the bureau of public safety delivered lectures in 173 public schools in Brooklyn, reaching approximately 200,000 children in the lower grades and 15,000 in the high schools. In addition to this, safety lectures were given in fifty-four parochial schools to approximately 40,000 pupils. These safety lectures were generally accompanied by an exhibition of stereopticon slides related to the subject of the lecturers' addresses and where schoolhouse equipment permitted, by the presentation of safety motion pictures, particularly the film, "The Price of Thoughtlessness," and the film, "The Locked Door," both of which were produced through the co-operation of the institution. It is estimated that about 95,000 children were reached with the motion pictures during the year. In forty-five schools safety patrols were organized with a total membership of 800 boys, and forty-two "Careful Clubs," with a membership of 770 were organized among the girls in the schools.

The safety patrols have been instructed through the co-operation of teachers in certain specified patrol duties in and about the schoolhouses in the hours of assembly and dismissal, whereby protection is given to the younger children while coming to and going from school; they have been used as a means of obtaining reports of accidents or dangerous conditions observed by the children and as a general stimulant of thought for safety in the schools where they have existed. Similarly the "Careful Clubs," without attempting specific patrol duties in and about the schools, have been made agencies of safety thought and safety endeavor among the girls.

There were distributed in the schools 190 safety bulletin boards and attractive safety bulletins from time to time were issued for posting on these boards as well as a supply of blanks for the reporting of accidents and dangerous conditions observed by the children.

Upwards of 400,000 safety buttons were distributed along with about 235,000 copies of a safety leaflet in story form. In seventy schools prize essay competitions were held on subjects related to safety, the prize being in each case a picture, book or other useful or decorative object suggested by the principal. These prizes were presented to the schools in the name of the child adjudged to be the winner of the essay contest.

As in the previous year a large safety calendar was provided for every school classroom in Brooklyn, public and parochial, where such calendars could be displayed, approximately 8500 of such calendars being provided, and thus effectively placed before the school population of the borough. About 1000 small calendars were distributed to various organizations and individuals engaged in safety work throughout the country with whom the institution has been exchanging safety ideas and material.

In addition to the work in the public schools the bureau of public safety developed to a considerable extent lectures among social and civic organizations. Upwards of 100 such lectures were delivered to approximately 40,000 adults. At these lectures safety motion pictures were exhibited

where possible and for this purpose educational films, such as, "The Workman's Lesson," and "The Crime of Carelessness," were presented through co-operation with the National Association of Manufacturers and other organizations engaged in summer work.

The summer term in the schools and playgrounds began on July 6 and came to a close on Aug. 20. The instruction at these playgrounds was of an informal and personal nature, and the circumstances under which the lecturers met the children were particularly well adapted to bringing the safety lessons home to the children in a personal and effective way.

At many of the playgrounds parents as well as children were addressed. Safety lectures were given between July 6 and Aug. 20 in sixty-two of the sixty-six vacation schools and playgrounds, about 50,000 children and 1100 adults being reached. Safety buttons were distributed to these children as well as to the children in attendance at the public schools.

The president of the Brooklyn Institution for Safety has served during the year as a member of the Mayor's central committee on street traffic and safety. In this capacity he has presented the experience of the institution gained in its public safety work in Brooklyn to this committee, which advises the Mayor and the Police Commissioner in respect to safety problems throughout the city. Specifically he has transmitted to the Mayor's central committee on street traffic and safety suggestions as to a plan of co-operation between various municipal authorities and local interests in working for child safety in public streets and places. The president of the institution has also prepared for the information of the president of the Board of Education, based upon the work done in the Brooklyn Public Schools, a plan for the proposed extension of the safety patrol system in the schools.

The Brooklyn Rapid Transit Company has provided funds to continue the work in the public schools during the coming year. The crusade for the next year, as approved by the Department of Education of the city and the directors of the Brooklyn Institution for Safety, will embrace a new feature in the shape of district safety work, as well as containing the safety instruction which has been given in the public schools.

The studies which have been made by the bureau of public safety of the Brooklyn Rapid Transit Company in conjunction with the Brooklyn Institution for Safety have indicated that the hazard of street accidents in Brooklyn is most severe in certain well-defined districts where tenement houses and similar causes of congestion abound. Many of these districts are comparatively small and consist of a few blocks on a given street or group of streets, within which accidents, particularly to children, are very common. Last spring, for the purpose of trying out the possibilities of safety work in such congested districts, a section of Myrtle Avenue between Tompkins and Sumner Avenues was taken up by the bureau of public safety. Co-operation was established between police and public school authorities, churches and local organizations. Literature was distributed and meetings held and the population, old and young, was greatly impressed with the work carried out in its own behalf.

The success of this experiment has led the Institution for Safety through the bureau of public safety to feature similar work for the coming year. The so-called danger sections are now being checked up, and during October each one of these districts will be taken up in its turn and systematic safety work with the co-operation of both public and private agencies will be conducted therein. While the district safety work is built up around the most common types of street accidents it is not restricted to such hazards—the dangers of fire and firearms, of falls, drowning, etc., are all emphasized.

In the public schools the safety patrols and careful club feature have been organized during the last two years and will be continued to further development by the bureau of public safety.

Negotiations are now under way for the production of a new safety motion picture to supplement the film, "The Price of Thoughtlessness" which has been in constant use in safety work of Brooklyn for nearly two years.

BAY STATE FARE HEARING PLANS

Protracted Investigation Anticipated on Application to Increase Fares on 954-Mile Suburban System

The Massachusetts Public Service Commission has announced that hearings on the proposed general increase in fares upon the Bay State Street Railway will begin on Nov. 8. The new schedules were to become effective on Nov. 1, but under the statute the commission is allowed six months in which to consider the matter. The proposed rates will therefore be suspended for the full period unless otherwise ordered. In view of the large area affected by the case, the size of the company, and the number of municipalities concerned, it is expected that an exhaustive and protracted investigation will be necessary.

At the request of the commission the company has had copies of the new fare schedules printed. These are being sent by the board to the local authorities in the cities and towns affected. To assist counsel the board is also supplying those desiring them copies of its opinions in recently decided fare cases, and has expressed itself ready to welcome any suggestions as to methods of investigation, or to principles and rules which ought to be applied in dealing with the Bay State case.

On the fourteen divisions of the company in Massachusetts there are about 875 fare limits, single-fare units predominating over through fares. By the new schedule local fares in some municipalities would be increased from a 5-cent to an 8-cent unit, notably in Reading, Wakefield, Stoneham, Woburn and Melrose, and in part in Winchester, Brockton, Quincy, Milton, Hingham and elsewhere. On the Reading and the Woburn divisions, for example, nearly 100 fares are listed with a rate per mile ranging in general from 2.47 cents to 3.41 cents. On the Lawrence and Haverhill divisions there are several zones where the per-mile rate will exceed 2 cents, and also on the Gloucester division. On the Salem division the rate usually runs below 2 cents per mile, and on the Lynn division twenty-four zones are below 1 cent and thirty-one above 1 cent per mile. On the Chelsea division the rate runs from slightly below 1 cent to a maximum of 4.84 cents per mile.

Near-Side Stop in Elgin.—The City Commission of Elgin, Ill., has ordered that all street cars must hereafter stop on the near side.

Exchange Arranged Between Canadian Lines.—Arrangements have been completed between the London & Port Stanley Railway, London, Ont., and the Wabash Railway, for an interchange of freight and passenger traffic.

Loans of \$25,000 in St. Louis in August.—The Savings & Loan Association, organized among the employees of the United Railways, St. Louis, Mo., loaned to its members in August \$25,000. The membership of the association now numbers 2151. The loans made during the last eight months total \$146,000.

Motorman Exonerated.—Sidney Boyt, motorman of the car of the International Railway which met with disaster at Queenstown Heights, Ont., on July 7, has been found not guilty of the charge of manslaughter lodged against him by the dominion police authorities before Magistrate Campbell in St. Catharines, Ont.

Cincinnati Suburban Fare Case Before Ohio Supreme Court.—The case of the Interurban Railway & Terminal Company, Cincinnati, Ohio, against the city of Cincinnati, involving a reduction of fare to 5 cents between Pleasant Ridge and the end of the line, was heard in the Ohio Supreme Court on Sept. 23. Attorney Frank Dinsmore appeared for the company and Walter M. Schoenle, city solicitor, for the city. The company lost in the lower courts and at present an injunction prevents it from collecting more than 5 cents between the points mentioned.

Publicity for Louisville Suburban Lines.—Plans for publicity by which Louisville people can be induced in greater numbers to use the country cars of the Louisville & Interurban Railway in search of views and recreation are being considered by R. H. Wyatt, general freight and passenger agent of the company. At his suggestion the officials of the company have taken under advisement a plan of dis-

playing in the city cars views of picturesque landscapes with statements to the effect that such and such a view is to be seen on the LaGrange, the Shelbyville, the Prospect or other line at this or that point.

Semaphore Traffic System for Louisville.—Louisville's police authorities are about to make some experiments with the semaphore system of traffic regulation at the busy street intersections, by way of increasing the efficiency of the traffic officers. It is expected that the first installation will be made at Third Street and Broadway. This is a busy corner with much automobile and street railway traffic. Large apartment houses here have produced many complaints that the whistle of the traffic officer is disturbing to the occupants. The safety-zone system, which has been in effect for a year or more, has proved so uniformly successful that the police authorities are interested in whatever comes along in the way of an improvement.

Three-Car Trains Operated in St. Louis.—Expansion of business in Granite City, Madison and Venice, Ill., immediately across the river from St. Louis, Mo., necessitated an increase in the street railway service furnished by the St. Louis Electric Terminal Railway, and to meet this demand three-car trains have been put in operation. These trains consist of a motor car, equipped with GE-201 or Westinghouse 306 motors, and two trailer cars. The motor cars and trailers are all single end with full vestibules on both ends. The motor cars were described in the *ELECTRIC RAILWAY JOURNAL* of May 28, 1910, page 951. These cars furnish a combined seating capacity of 126. They are 50 ft. long over the bumpers and 9 ft. 3 in. wide over the side sheathing. The three-car trains are operated for the accommodation of passengers living in St. Louis and employed in a number of large industries on the Illinois side of the river. Safety appliances on these cars include a green signal light to indicate to the motorman that the vestibule doors are closed. The cars are wired in series, making it necessary for all doors on the motor and trailers to be closed before the signal light shows in the motorman's cab. All cars are equipped with folding doors and steps. The trailer capacity has been increased by removing the bulkheads between the vestibules and the body of the car. The satisfactory results obtained from the operation of these three-car trains has induced E. D. Bell, general superintendent of the company, to decide to increase the number of trains of this type as business justified.

Eighty-five Autos Driven Through Lowered Gates on Long Island Since Jan. 1.—Exactly \$4,327.01 has been spent in the last three months by the Long Island Railroad for 176 newspaper advertisements in New York City, Brooklyn and on Long Island, to make people more careful in driving automobiles over grade crossings. Twenty-five crossing gates on Long Island have been painted with black and white stripes. Heavy gates made of telegraph poles have been placed at one of the crossings leading to Long Beach and another at Central Islip. Similar gates will be placed at other crossings. Thirteen large signs, most of them electrically lighted at night, have been displayed over the main roads on Long Island warning automobile drivers of the danger they run in going over railroad grade crossings without stopping to look for trains. Since the first of the year eighty-five automobiles have been driven through lowered crossing gates. In fifty of these cases the gates were broken by the machines. These gates were lowered to warn automobile drivers of approaching trains. J. A. McCrea, general manager of the Long Island Railroad, said on Sept. 24: "We have devoted much time and thought during the past summer to the question of how most effectively to prevent automobile accidents at grade crossings, and we have adopted every suggestion that was at all feasible. It is quite clear, however, from the number of accidents due to reckless driving which we have had reported to us in the past summer, that the railroad alone will not be able to do very much. As long as there are crossings—and certainly all the grade crossings on Long Island cannot be eliminated at a moment's notice—accidents will occur unless the State and township authorities take up the subject vigorously. We are going to continue our campaign, and I hope next summer we will be able to think of something sufficiently startling to arrest the attention of those reckless drivers with whom it seems utterly useless to reason."

Personal Mention

Mr. Edward H. Dewey of Nampa has been elected president of the Boise Valley Traction Company, Boise, Idaho, the corporation that took over the Idaho Traction Company's lines following the receiver's sale. This company, which forms a part of the power merger, will be operated as a separate unit.

Mr. T. Lee Miller, for the last four and a half years associated with the Toledo Railway & Light Company, Toledo, Ohio, in the capacity of assistant to the president and manager in charge of operations, has been placed in charge of the Sangamo Electric Company's New York office. Mr. Miller was graduated from the University of Cornell, class of 1909, and established connections with Warwick, Mitchell, Peat & Company, accountants, where he originated and established the present efficiency system for the Buick Motor Company.

Mr. J. H. Prior has been appointed chief engineer of the State Public Utilities Commission of Illinois. Mr. Prior was educated at the Armour Institute of Technology and the University of Chicago. He was engineer of design of the Chicago, Milwaukee & St. Paul Railway from 1905 to 1914, engaged in the design of all classes of railroad structures, structural betterments, and track elevation work for that company. In 1906 and 1907 he made valuations of that company's structures in Minnesota and South Dakota, required by the railroad regulatory and taxing bodies of those States. Previous to his appointment as chief engineer, Mr. Prior was assistant chief engineer of the commission he now serves. He is a member of the American Society of Civil Engineers and has been from time to time an officer of the Western Society of Engineers.

Mr. John A. Beeler has resigned as vice-president and general manager of the Denver (Col.) Tramway, in which capacities he will be succeeded by Mr. F. W. Hild, as noted in the next column. Mr. Beeler was born at Towanda, Ill., on June 28, 1867, and received his early education in the public schools of Cincinnati. He entered the street railway field in 1886 as an assistant in construction work with the engineering department of the Vine Street Cable Railway, Cincinnati. Continuing in cable construction work, he went to Denver, Col., in 1888 as assistant engineer with the Denver Tramway. In 1890 he was made constructing engineer for the Denver Tramway, which was then actively engaged in building electric lines. In 1898 he was elected chief engineer of the Denver City Tramway, which represented a merger of all the railways, cable and electric, in Denver. In 1902 he was elected vice-president and general manager of the system. Mr. Beeler was among the first to adopt a double-truck trail car for handling rush-hour loads or peak traffic. He also introduced a number of other novel features that have created much interest in the railway field. One was the employment of student conductors, selected from the local universities and high schools, to man the trailers operating during the periods of heaviest travel.

Mr. Edmund S. Davis, chief engineer of the Boston (Mass.) Transit Commission, who is one of the engineers called upon by the New York Public Service Commission to investigate the construction conditions on the new subway system now being built in New York City, was born in Northfield, Vt., sixty-seven years ago. From 1876 to 1879 he was employed on the Boston water works system, and from 1880 to 1890 was located in Colorado, where he served in the United States surveyor-general's office at Leadville and Denver. In 1890 he located in Boston and was associated with Mr. Howard A. Carson in the formation of the Boston Transit Commission's engineering staff. All the

subway construction in Boston has been under Mr. Davis as principal assistant to Mr. Carson, and on the latter's retirement in 1909 Mr. Davis became chief engineer of the board. The building of the Boylston Street subway under the leaning tower of the Old South Church in Copley Square was carried through under his direction. This is, perhaps, the most difficult task the commission has had in the twenty years of its activity.

Mr. F. W. Hild, general manager of the Portland Railway, Light & Power Company, Portland, Ore., has resigned from that company to become vice-president and general manager of the Denver (Col.) Tramway.

F. W. HILD

Mr. Hild has been general manager of the Portland Railway, Light & Power Company since March 15, 1911. This company operates 286 miles of electric railway and does a general lighting and power business in Portland and vicinity. Mr. Hild was in charge of the railway, light and power operating departments of the company. He was formerly assistant general manager and chief engineer of the Havana (Cuba) Electric Railway. He was graduated as an electrical and a civil engineer from Union College at Schenectady, N. Y., in the class of 1898 and was for a time connected with the General Electric Company. While in the employ of this company Mr. Hild assisted in the important rehabilitation work carried out by the Twin City Rapid Transit Company, the Kansas City Railway & Light Company and the Chicago Edison Company. Mr. Hild was one of the originators of the idea of organizing an association to represent the electric railways on the Pacific Coast and was elected president of the Pacific Coast Electric Railway Association at its organization in San Francisco, Cal., on April 1, 1913. A farewell luncheon extended to Mr. Hild on Sept. 30 by the Portland Chamber of Commerce was attended by several members of the "Red Special" party of delegates to the San Francisco convention who were the guests that day of the officers of the Portland Railway, Light & Power Company. President C. Loomis Allen of the American Electric Railway Association, Mr. W. F. Ham, vice-president of the Washington Railway & Electric Company, Washington, D. C., and Mr. Charles C. Pierce, vice-president of the American Electric Railway Manufacturers' Association, addressed the members of the chamber on the electric railway problems of the day. Mr. F. T. Griffith, president of the Portland Railway, Light & Power Company, then paid a tribute to the ability of Mr. Hild, who replied in a fitting speech. Mr. Hild succeeds Mr. John A. Beeler with the Denver Tramway. The Denver company operates 230 miles of line.

OBITUARY

Rufus R. Canfield died on Sept. 23 at Sequim, Wash. He was sixty-one years of age. Mr. Canfield assisted in building the electric railway at Windsor, Canada, and became superintendent of the line. Later he was connected with the Detroit & Northwestern Railway, of which he was an officer until the merger of the company with the Detroit (Mich.) United Railway. He then became superintendent of the Syracuse, Lakeside & Baldwinsville Railway, which was succeeded after sale under foreclosure by the Syracuse, Lake Shore & Northern Railroad and is now included in the system of the Empire United Railways, Inc. Mr. Canfield removed to Sequim in 1908.

T. J. Hanlon, Jr., manager of the Pensacola (Fla.) Electric Company, has written the following letter to the City Commissioners regarding tickets for school children: "We have received from our Boston office authorization to sell a 3½-cent school ticket as was recently requested by you. These tickets will be sold in books of forty each, and will be good on school days only, between the hours of 8 a. m. and 5 p. m."

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***City Electric Company, Albuquerque, N. M.**—Incorporated in New Mexico to operate a railway system, also to operate trackless vehicles and do general electric power business. Offices, Albuquerque. Capitalization, \$250,000. Incorporators: George Roslington, Lloyd E. Sturges and E. L. Groze.

FRANCHISES

Ceres, Cal.—The Tidewater & Southern Railroad has received a franchise from the Council to construct a line through Ceres. The company is building a line from Stockton to Modesto and Turlock. The company has asked the Council of Stockton for a franchise to construct a single track along Sutter Street from Hazelton Avenue to Main Street.

Los Angeles, Cal.—Bids will be received until Oct. 6 by the Council of Los Angeles for a twenty-one-year franchise on San Pedro Street and South Park Avenue from Thirtieth Street to Slauson Avenue. Bids will also be received for a twenty-one-year franchise on San Pedro Street and South Park Avenue from Thirtieth Street to Florence Avenue.

Cambridge, Mass.—The West End Street Railway has asked the Council for a franchise to relocate its track on Garden Street at Mason Street and at Concord Avenue, and on Huron Avenue from Concord Avenue to Aberdeen Avenue.

Farmington, Mich.—Frederick McCain, Detroit, has asked the Council for a franchise to construct an electric railway between Farmington and Royal Oak.

Collegeview, Neb.—The Lincoln Traction Company has received a twenty-five-year franchise from the Council to construct a loop around block 25 in Collegeview.

Yorkville, N. Y.—The New York State Railways has received a franchise to place its tracks in the center of Whitesboro Street, Yorkville, and on the easterly and westerly approaches of the new halfway bridge.

Elyria, Ohio.—The Cleveland, Southwestern & Columbus Railway is negotiating with the city of Elyria for a renewal of its franchise for twenty-five years. The company has agreed to pay a portion of the expense of eliminating the railway crossing on Bridge Street. Peter Witt, street railway commissioner of Cleveland, has suggested to the city that the company put 1 cent out of each 5-cent fare into a trust fund to belong to the city and be used for extensions and betterment of service.

Providence, R. I.—The Rhode Island Company has received a franchise from the Council to relocate its tracks on Narragansett Boulevard from the side to the center of the street.

El Paso, Tex.—The El Paso Electric Railway has received a franchise to construct a line on Piedras Street from Alameda Street to Boulevard Street.

Galveston, Tex.—The Galveston Electric Company has received a franchise from the Council to construct single track beginning at a connection with its present track on Fifty-sixth Street and Avenue V½, extending on Avenue V½ to Fifty-third Street, connecting with the company's track at Fifth-third Street and Avenue V½. The franchise was granted on condition that the company abandon its track on Fifty-third Street from Avenue V½ to the beach, on Fifty-sixth Street from Avenue V½ to the beach and on Avenue W½ from Fifty-third Street to Fifty-sixth Street.

TRACK AND ROADWAY

Los Angeles (Cal.) Railway.—Orders have been issued to this company by the Board of Public Utilities to install a 1500-ft. stretch of double track on the Temple Street line, beginning at Robinson Street, to provide proper siding accommodations for that line.

Pacific Electric Railway, Los Angeles, Cal.—This company will electrify the municipal belt line at the harbor, 6½ miles. This was the only bid received for the work.

Municipal Railways of San Francisco, San Francisco, Cal.—A bill ordering the construction of an extension of the Geary Street municipal railway across Golden Gate Park from Tenth Avenue and Fulton Street to Fourteenth Avenue and Lincoln Way, and thence to Judah Street, was passed by the Board of Supervisors on Sept. 20 with only one dissenting vote. At the same time the supervisors adopted a resolution requesting that the Park Commission grant permission for the construction of the proposed extension of the municipal railway across Golden Gate Park.

Boise (Idaho) Railroad.—This company has awarded a contract to S. E. Burnham for the construction of an extension from the present terminal of the Thirteenth Street line to connect with the Soldiers' Home line.

***Hillsboro, Synthiana, Bainbridge & Chillicothe Traction Company, Hillsboro, Ill.**—This company made application to the Public Utilities Commission of Ohio on Sept. 23 for permission to issue \$500,000 capital stock to sell at 80 and \$1,700,000 first mortgage, 5 per cent, ten-year bonds to sell at 85, the funds thus secured to be used in building an electric line between Hillsboro and Chillicothe, 42 miles. It is claimed that 80 per cent of the right-of-way has been secured.

Kankakee & Urbana Traction Company, Urbana, Ill.—This company has awarded a contract to the Central States Bridge Company, Indianapolis, Ind., for the construction of the only bridge necessary between Ludlow and Paxton. It is to be 100 ft. long and only one span. The two pieces of steel weigh 115,000 lb. A slight change has been made in the line from the original plans so as to pass a large timber tract half-way between Ludlow and Paxton to be converted into a park by a stock company of Paxton people. They have agreed to spend \$10,000 in making it ready for boating, swimming and other amusements. By the change the line extends about a half mile further east than originally intended.

Union Traction Company, Coffeyville, Kan.—This company is leveling its track on Eighth Street west of Walnut Street. An entirely new base, the same as on East Eighth Street, is to be put in.

Anthony & Northern Railway, Hutchinson, Kan.—Plans are being considered to build extensions of this company's line north from Pratt. Cars are running to Trousdale, and Larned business men have guaranteed to O. P. Byers, promoter of the line, that the city and townships in Pawnee County traversed by the new line will vote \$115,000 in bonds. Kinsley business men have duplicated the offer.

Kansas City-Western Railway, Kansas City, Kan.—New track is being laid by this company on Thirteenth Street, Leavenworth. The rails will be 60 ft. long, weighing 80 lb. per yard. There will be 6 in. of rock under the ties.

Salina (Kan.) Street Railway.—This company has abandoned the construction of its Park Street line to the new union station at Salina as the Mayor will not recede from his position which requires a bond to be given by the company to protect the city from any damage that might arise on the street. The company is willing to give bond to protect the city from the company's negligence. The business men of Salina have taken up the matter in an effort to have the city waive the unreasonable demand regarding the bond.

Worcester (Mass.) Consolidated Street Railway.—Work has been begun by this company repairing its tracks on Main Street from May Street south. Work has also been begun on the construction of double tracks on Pleasant Street from the end of the present double track to Moreland Street. The laying of new rails on the Canterbury Street line from Webster Square to Freemont Street will be started soon.

Metropolitan Street Railway, Kansas City, Mo.—Work has been begun by this company on the construction of its tracks on Broadway south from Fourteenth Street to Southwest Boulevard. The extension of the Prospect Avenue line from Forty-eighth Street to Seventy-second Street will be begun within a few weeks.

Springfield (Mo.) Traction Company.—Plans are being made by this company to construct an extension of its Monroe Street line to Phelps Grove Park. It is planned to use the rails on Boonville Street, which are to be removed to make way for heavier and more modern equipment of that line.

Three Forks, Mont.—The contract for the construction of the line between Three Forks and Radersburg has been awarded to Clifton, Applegate & Company, Spokane, Wash. Julius Rosholt, Fairmount, N. D., is interested. [Aug. 21, '15.]

New York, N. Y.—On Oct. 15 the Public Service Commission for the First District of New York will open bids for portion "C" of the ballast contract for the new rapid transit lines. This portion covers about 80,000 cu. yd. of trap rock, or hard limestone. The commission has already awarded contracts for nearly 300,000 cu. yd. of ballast.

Interborough Rapid Transit Company, New York, N. Y.—In a few weeks the Public Service Commission of New York will advertise for bids for the digging of another East River rapid transit tunnel. It will be the tube from the foot of Fourteenth Street, Manhattan, to North Seventh Street, Brooklyn, which will carry the tracks of the Fourteenth Street-Eastern District line of the dual system. The work has been held up because a permit granted by the War Department made the city responsible for all loss or damage due to construction. The commission objected, and the War Department has modified the permit so that the city's obligation is restricted to "all legal liability."

Cleveland (Ohio) Railway.—Operation has been begun by this company on its extension on Euclid Avenue, Cleveland.

Bartlesville (Okla.) Interurban Railway.—This company reports that it is reconstructing $\frac{1}{2}$ -mile of track in Dewey, using 72-lb. 6-in. T-rail to replace 60-lb. rail. The company is also constructing a 2-mile loop in Bartlesville.

Southwestern Light, Power & Railway Company, Oklahoma, Okla.—A report from this company states that it will construct a line from Oklahoma to Dennison via New Castle, Duncan, Lawton, Lindsay, Davis, Ishmingo and Durant, 176 miles. The line will reach a park at Arbuckle. The power station will be located at Davis and the repair shops at Arbuckle. The company will also furnish power for lighting. The contract for the construction of the line has been let to the Arbuckle Construction & Improvement Company. Officers: W. T. Croslen, president; J. H. Stewart, secretary; W. P. Woolsep, general manager, and A. L. Mitchell, electrical engineer. [Sept. 18, '15.]

Philadelphia & Western Railway, Upper Darby, Pa.—Direct electric car service between Philadelphia, Valley Forge, Phoenixville, Spring City and Pottstown will be established within a year if the plans formulated by a group of Philadelphia financiers are fulfilled. The Philadelphia & Western Railway will form the terminal trunk line and perform an important part of the new service, it being planned to run the new cars over their tracks. The plan embraces the extension of the Phoenixville, Valley Forge & Strafford Railway to a connection with the Philadelphia & Western Railway at Bridgeport. It will be necessary to build 7 miles of line. The cost is estimated at about \$300,000. The Phoenixville, Valley Forge & Strafford Electric Railway now runs $4\frac{1}{2}$ miles from Valley Forge to Phoenixville. From there the Pottstown & Phoenixville Railway now operates 25 miles in two sections, one from Pottstown to Sanatoga, the other from Spring City to Phoenixville. The gap from Sanatoga to Spring City is now being filled in by a new line under construction and largely graded.

Galveston-Houston Electric Railway, Galveston, Tex.—According to David Daly, general manager of this company, poles and other materials have been distributed along the temporary trestle over the causeway with a view to beginning immediate work to provide facilities so the company can send cars over the causeway under its own power. On account of difficulties to be encountered, by the fact that the single track across the temporary trestle is constantly being used for the many trains into and out of Galveston daily, it will be at least three weeks before this work can be finished and interurban cars can be operated across the trestle by electricity.

Richmond, Rappahannock & Northern Railway, Richmond, Va.—At a meeting of the stockholders of this company held on Sept. 16, the sale of \$100,000 in preferred stock and \$50,000 in common stock was authorized, the preferred stock to pay 7 per cent. Subscriptions have been received for \$25,000 of preferred stock. [Sept. 28, '15.]

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—Work will be begun at once by this company on the construction of an extension of its line on Asylum Avenue, Racine.

SHOPS AND BUILDINGS

Shore Line Electric Railway, Saybrook, Conn.—Work has been begun by C. M. Williams on this company's new carhouse in Thamesville. The building will be 60 ft. x 250 ft. and will be constructed of brick. The erection of the proposed carhouse on Montauk Avenue, New London, has been postponed until next spring.

Arkansas Valley Interurban Railway, Wichita, Kan.—The contract for the construction of this company's \$10,000 terminal at Hutchinson has been awarded to the Foy Construction Company, Hutchinson.

Holyoke (Mass.) Street Railway.—Plans have been completed by G. E. Pellissier, Springfield, for a new carhouse and substation to be erected at Amherst for the Amherst and Sunderland branch of the Holyoke Street Railway. The carhouse will be 130 ft. x 100 ft., of brick, mill construction, with blue stone or artificial stone trim, and all modern improvements. Part of this building will be two stories high, in which will be the offices. The substation will be 31 ft. x 102 ft., one story high.

New York Municipal Railway Corporation, Brooklyn, N. Y.—Station finish construction on the New Utrecht Avenue elevated railroad in Brooklyn will soon be undertaken. The Public Service Commission for the First District of New York will advertise for bids, to be opened Oct. 26, for the finish of eleven stations on that road between Tenth Avenue and Coney Island. The stations are Fort Hamilton Parkway, Fiftieth Street, Fifty-fifth Street, Sixty-second Street (express), Seventy-first Street, Seventy-ninth Street, Eighteenth Avenue, Twentieth Avenue, Bay Parkway (express), Twenty-fifth Avenue and Bay Fiftieth Street. The New Utrecht Avenue line will be operated by the New York Municipal Railway Corporation as a branch of the Fourth Avenue subway, connecting therewith through the Thirty-eighth Street cut.

POWER HOUSES AND SUBSTATIONS

Richmond Light & Railroad Company, New York, N. Y.—This company has ordered from the Westinghouse Electric & Manufacturing Company one 7500-kva. turbo-generator, together with motor exciter equipment, and one 10,000 sq. ft. surface condenser. The purchase of this additional power-house equipment, which is to be installed in the Livingston power plant, has been made necessary by the energy demand imposed by the thirty-two new all-steel cars, equipped with Westinghouse motors, recently placed in operation on this line.

Carbon Transit Company, Mauch Chunk, Pa.—A report from this company states that it is receiving bids on new power equipment consisting of boiler with culm burning furnace and a 300-kw. 600-volt, d.c. turbo or engine-driven generator installed complete with condenser, piping, etc.

Ashland Light, Power & Street Railway, Ashland, Wis.—This company was the recent purchaser at a private sale of what was the original plant of the old Kentucky Electric Company, organized in Louisville, Ky., about eight years ago. This plant, together with other units of the Kentucky Electric Company, passed into the possession of the Louisville Gas & Electric Company when that organization took over the utilities of the city. It was not available for use in connection with the system which has been centered in the Waterside plant of the gas and electric company and has been on the market for some time. The plant will be shipped, almost in its entirety, to Wisconsin. The equipment, which was installed about eight years ago, included four 350-hp. B. & W. boilers, automatic stokers, etc., three 500-kw. Curtis turbo-generators, rewound and changed over from two to three phase, etc.

Manufactures and Supplies

ROLLING STOCK

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., is considering the purchase of two single-truck cars.

Jefferson City Light, Heat & Power Company, Jefferson City, Mo., will shortly place in operation six new cars, which are being built in the Topeka shops of the Illinois Traction System.

TRADE NOTES

Fibre Conduit Company, Orangeburg, N. Y., has located its New York office in larger quarters at 101 Park Avenue, corner of Fortieth Street.

G. S. Ackley & Company, New York, N. Y., representing the Ackley Companies, with offices at New York, London, Paris and Berlin, has been appointed by F. A. Wasson as exclusive sales representative for the Wasson air retrieving and non-retrieving trolley bases, in the foreign fields, excepting Canada.

Electric Service Supplies Company, Philadelphia, Pa., has received the following orders for "Protected" rail bonds: Interborough Rapid Transit Company, New York, N. Y., 5000 type P-4 bonds, 211,600 circ. mil capacity, 46 in. long; New York (N. Y.) Railways, 2500 type P-4-P bonds, No. 00 capacity, 14 in. long.

H. W. Johns-Manville Company, New York, N. Y., has moved its Chicago office to larger quarters in a building which it will occupy at Michigan Avenue and Eighteenth Street. The main floor is divided into sales showrooms for the many products handled by this company, among which are asbestos roofing, siding and lumber, packing, pipe and boiler covering, electric insulation, clothing, builders' specialties, and numerous appliances for the steam and electrical engineer.

Prest-O-Lite Company, Inc., Indianapolis, Ind., is building a new storage-battery plant involving additional floor space of 45,000 sq. ft., or one-third of its present floor space. The new plant will be ready for operation by Dec. 1, 1915. In the meanwhile operations are being conducted in the Murphy Building, Indianapolis. This company is also engaged in establishing storage-battery service stations at all of its branches. Twenty branches have been so equipped up to the present time.

Midvale Steel Company, Philadelphia, Pa., now in control of a syndicate headed by William E. Corey, formerly president of the United States Steel Corporation, was reorganized with the election of Joseph Entwisle as president; William P. Barba, formerly general manager, as vice-president, and Mr. Corey, Percy Rockefeller and Samuel M. Pryor as directors. Mr. Entwisle was elected president temporarily in order to facilitate the transfer of stock. He will be succeeded by Mr. Corey at the next meeting of the board, which will be held in New York.

Ohio Brass Company, Mansfield, Ohio, has received an order for 107,000 catenary hangers and other accessories from the Chicago, Milwaukee & St. Paul Railway for what is known as the third and fourth sections of its new electrification. This order constitutes half of the equipment of this kind necessary to be installed on the 200 miles of these new sections. This manufacturing company has also received an order from the Interborough Rapid Transit Company for 5000 standard-type rail bonds for the new elevated tracks now under construction in Queens County, Long Island.

Harry Vissering & Company, Inc., Chicago, Ill., whose automatic sand dryer was described in the *ELECTRIC RAILWAY JOURNAL* for Sept. 11, have made a number of installations on other electric railways besides the San Antonio (Tex.) Traction Company. Among these may be mentioned the Northampton (Mass.) Street Railway, Holyoke (Mass.) Street Railway, Coney Island & Brooklyn Railroad, now a part of the Brooklyn Rapid Transit System, Knoxville (Tenn.) Railway & Light Company, Des Moines (Iowa) City Railway, Seattle (Wash.) Municipal Railway, and Rhode Is-

land Company, Providence, R. I. The Rhode Island company purchased a dryer in December, 1912, and reported recently that it had not spent 1 cent for repairs.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., in order to encourage the spirit of thrift among its employees, has just established a savings fund which offers facilities to the employees for the handling of their savings accounts. This fund is open to any employee of the company wherever he may be located, and he may become a depositor at any time and discontinue at any time. The amount of the deposit cannot be less than 10 cents and may be any multiple thereof and the deposits must be made from each regular pay. The deposit, however, is limited to one account, the amount of which in any one year cannot exceed \$500. The idea of this is that the plan is intended as a method of encouraging the employee to save his earnings and when he has been successful up to this point, allow him to handle his own finances. Interest is paid on the deposit at the rate of 4½ per cent and is credited semi-annually. The Westinghouse company acts as a trustee and guarantees the deposits and interest. The rules provide that an amount of \$100 or less may be withdrawn without notice, but an interval of two weeks must elapse before subsequent withdrawal can be made, and for withdrawals more than \$100, notice of one week must be given. An auditing committee not to exceed seven persons is to be elected by the depositors from among their own number, which committee shall be given an opportunity to examine the condition of accounts at semi-annual interest periods, the findings of which shall be published.

ADVERTISING LITERATURE

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a bulletin listing its various railway supplies.

Standard Machinery Company, Auburn, R. I., has issued a catalog describing its various types of foot and mechanically operated presses, including an aluminum slide armature notching press.

Stone & Webster Engineering Corporation, Boston, Mass., has issued a bulletin which contains illustrations of the new coal gas plant of the Fall River Gas Works Company, which was designed and constructed by this engineering corporation.

Holophane Works of General Electric Company, Cleveland, Ohio, has issued a lighting handbook. This publication covers the general subject of illuminating engineering from the practical standpoint and contains as well elementary technical data on lighting and data on the engineering performance of the products which this company manufactures.

S. K. F. Ball Bearing Company, New York, N. Y., has issued a reference folder for the various bulletins recently published by this company, each of which includes separately the following subjects in their relation to ball bearings: general bulletin, railway lighting generators, hangers, textile machinery, automobile worm drive, electric motors, street railways, paper-making machinery, grain-milling machinery and machine tools.

Standard Railway Supply Company, Cincinnati, Ohio, has issued a folder describing its new improved "K-I" splicing sleeve. In this new sleeve the ends of the trolley wire, when in position in the sleeve, are bent downward, thus making it possible to lessen the thickness of the metal on the side opposite the wedges where least needed, and increase the thickness of metal over the wedges where most needed.

G. C. Reiter, Canton, Ohio, has issued advertising literature describing its various types of gongs for street cars or emergency wagons. The gong shells are manufactured from a special analysis of bell steel. It is stated that they give a loud, clear ring and will not crack, break or lose their tone under any conditions of service or atmosphere. The gong shells will fit any attachment. They are pressed, not cast. The types illustrated in the catalog include single-stroke foot gongs of the horizontal and vertical types, single-tap inside-striking foot gongs, single-stroke roof or hood gong, rotary vertical-type multiple-ringing gongs for foot, roof or hood, and multiple-ringing pneumatic gongs.

No. 15

SAN FRANCISCO AS A CONVEN- TION CITY

In spite of its distance from the East, San Francisco was the logical place in which to hold the convention this year. The exposition was, of course, the great attraction. It was the magnet for the selection of San Francisco as the convention city by nearly all of the national associations which have held conventions this summer. The American Electric Railway Association had another compelling reason. Its members on the Pacific Coast had for many years loyally sent representatives to different cities in the East for the annual convention, and it was only fair that they should have the compliment of a return visit at some time, and this was the logical time. In spite of the distance which the trip required for many of the delegates there was a satisfactory attendance of delegates from the East. While not as many were present as at recent Atlantic City conventions the attendance was good compared with those at other national conventions which have been held in the Far West during 1915. The depression in business undoubtedly kept many away who would otherwise have been present, but the attendance was representative, and those who took the trip were well repaid. There is a spirit of enthusiasm and energy which characterizes all work on the Pacific Coast, including that of the electric railways, which no one can realize until he has actually lived in the Far West and has seen the work accomplished there.

LOWER COMPANY SECTION DUES

The association has been generous to the company section members in reducing the annual dues 60 per cent. These dues are as low as is consistent with the dignity of a national association. A certain minimum is also essential to proper appreciation on the part of the individual, for what costs nothing is valued correspondingly. The association has shown that the individuals are not sought as members for the income they would produce, but that it desires to serve the company members which support it by making their employees better employees. We believe that a chief function of the company section is to foster local loyalty and co-operation. While local associations are excellent they cannot be as effective when independent as when bound to a national society. It should be much easier henceforth to form sections if only for the rather selfish reason that the present local members in a community can save money by becoming section members, and to be such they must have a section to join. But the mere reduction in dues is not alone going to enlarge the membership greatly. The fact of the reduction must be widely advertised and the company section programs kept at

such a high standard of attractiveness and value that the men will not only come in but stay in. We anticipate a year of great company section activity as a result of this association action.

SAFETY CODE CONFERENCE COMING

President Allen in his San Francisco address mentioned the work of the National Bureau of Standards in the preparation of an electrical safety code, and stated that the association has been actively co-operating with the bureau. This is a most important matter and time is now at a premium for getting in constructive suggestions, as the Washington conference is less than three weeks off. During the past few days there have been several important conferences in the East, in which the association was represented and much progress was made. Some details in the preliminary edition of the proposed rules aroused considerable opposition, as was natural. It was only by putting something tangible into the hands of the operating and constructing engineers that these objectionable details could be brought to light. They will undoubtedly be eliminated. President Allen has certainly done his best to bring out the facts from the railway standpoint.

AMMUNITION FOR THE PROGRAM COMMITTEE

The award of the company section medal at San Francisco to J. W. Bury, assistant superintendent of transportation Manila Electric Railroad & Light Company, for his paper on courtesy serves to remind the section program makers of a means which is at their disposal for stimulating latent literary talent. It is an honor to the section as well as to the individual to have such an award. Moreover, with the number of sections as small as it now is, there is more chance to obtain the medal than there will be later. Mr. Bury's paper, which was delivered in Manila on April 6, 1915, was briefly abstracted in the issue of the ELECTRIC RAILWAY JOURNAL for May 29, page 1033. The spirit of it can be gathered from the following quotation from our abstract: "The platform man has peculiar temptations to be discourteous, and the public blames a great deal of its discomfort in transportation on the car conductors. The motormen, who are to blame for many of the conductors' troubles, should co-operate with the latter in the matter of courtesy. The inspectors have an excellent opportunity to promote pleasant relations between platform men and the public." If the award of the medal will act to help the program committees in bringing out papers of this type it will be worth much more than its cost. An excellent beginning has been made in the past two years.

PAPERS AND ADDRESSES AT SAN FRANCISCO

The San Francisco conventions were characterized by a number of important addresses by men of national reputation on leading topics of the day, notably the papers by ex-Senator Bourne, B. J. Arnold, J. W. Lilienthal and Paul Shoup. The address by Mr. Shoup, which we hope to be able to give in extenso next week, is but briefly abstracted in the present issue of the *ELECTRIC RAILWAY JOURNAL*. In it he contrasted the governmental policies toward the railroads and agriculture and advocated education of the public. Mr. Lilienthal told of the possibilities of improving the inside conditions of a corporation in an equally large way and of the proper methods of treating the employees and the public. His address is abstracted elsewhere in this issue. We commend both of these papers to the thoughtful consideration of railway men. All such can apply the principles of welfare work for the public and for employees as were clearly enunciated by Mr. Lilienthal. The position of the electric railway companies of the present day would be very much better if the doctrines described by him had been more generally followed in the past. Indeed, his paper might well be considered in the light of an elaboration of the code of principles.

The address of the president of the association is always an important document and should be considered among the notable addresses at San Francisco. Mr. Allen gave a vivid picture of the problems now before the industry and of its present condition. In nearly all sections of the country the situation confronting the electric railways of the country is the same, and the cumulative effect of this condition spread over a number of years has brought new construction of electric railroads to a standstill. The condition cannot be ascribed to the business depression entirely or even largely. The properties, it is true, have suffered from this cause in their gross receipts, but the trouble is far deeper and is one which will not be greatly relieved even if there should be a revival of general business unless there are other alleviating conditions. The differences between the electric railway industry and others which can increase their prices or reduce their service as the occasion demands are not properly understood by the general public, which instead of lightening the burdens of the electric railways seems intent on increasing them.

How best to overcome this is the chief problem, not only before the industry but also before those who believe that the prosperity of the country is dependent largely upon the proper development of its transportation facilities. To assist the association in helping to solve this problem Mr. Allen has recommended certain changes in the organization of the association by which a closer relation will be created between it and the Manufacturers' Association. The committee to which his suggestions have been referred is a strong one, and until a definite plan is formulated no opinion can be expressed. As we view the situation the manufacturers can help in two ways. One of these is the work

which they have been doing in connection with the exhibits. This they have done well. The other is a broader work to which they have yet hardly put their hand. Whether the two rather dissimilar tasks can best be performed by two organizations or by one, and whether the plan of making the Manufacturers' Association an affiliated association is the best remains to be determined. These are the questions which the new committee is to decide and upon which it will report, presumably at the next regular meeting.

HELPING THE EXECUTIVE

The address of G. B. Willcutt before the Accountants' Association emphasized in noteworthy fashion the important part that accountants' reports, ordinary and otherwise, play in administrative work when they are properly compiled, compared and analyzed. The problems confronting modern executives have in late years increased so much in volume and complexity that very broad knowledge and experience on their part is necessary for quick and correct decisions on questions submitted to them. In this state of affairs the modern executive to be successful is forced to depend on his analysis of facts that have been collected and arranged for his instantaneous and continuous use. Here the accountant has already done much, as is shown by the comprehensiveness of the work described by Mr. Willcutt, but the end is not yet.

In a sense the accountant and the executive are inclined to look at financial and operating statistics from two widely differing points of view. The accountant, it has been said, primarily wants a bird's-eye view of the status of the corporation at a particular moment or the general results at the end of a particular period. The mind of the executive, however, works differently, for he wants a "cross-index" of the accountant's information at all points and for all periods so that he can study the entire or partial history of all or any portion of the corporation's activities. The difference, we would conclude, is inclusiveness of vision, and it is only by acquiring as far as possible the executive's breadth of view that the accountant can intelligently and thoroughly furnish the executive with all of the data which he requires.

In this connection, we are inclined to believe that the mass of statistical work carried on by operating departments in calculating economies would better be handled by the accounting department to a large extent. Aside from the fact that the resulting figures would probably be unbiased and more reliable by virtue of being compiled in a department having no axes to grind, this plan would by actual practice give the accounting department the desired wider view of the executive's problems and his needed information. Similarly we believe that the accounting department should act on its own initiative in ascertaining the data that are required for successful operation as the industry continues to develop, instead of passively awaiting executive instructions. In other words, what the committee on passenger-accounting has done this year in

hunting down old daily reports now valueless to the traffic and schedule departments, the ideal accountant will correspondingly do for all information, old and new, that the executive is using or can use.

THE SCIENCE OF TRANSPORTATION

To one who reads the reports presented before the Transportation & Traffic Association the impression is inevitable that the problems of this branch of the industry are rapidly approaching the field of applied science, and the time when the transportation official was interested only in personal experiences and measured his success solely by the indefinable qualities involved in the handling of men seems certainly to be passing. In its place has come an era of consideration of mechanical devices, traffic checks, schedule construction and the like, in which the elements of calculations based on definite general factors begin to loom large.

In this light the first report of the newly-formed committee on standards comes at a significant period, and though this committee's work for the past year was limited to the establishment of a code of procedure, the way has now been paved for the establishment of definite data on transportation practices. Naturally the most obvious material of this kind is to be found in the code of rules, and as evidence that the present code has reached a final form may be cited the fact that this year's committee on rules suggested in its report but three revisions. All of them were in the interurban code, one having to do with the flagging rule investigation and the other two, which had been submitted before previous conventions, involving certain modifications in the slow-speed-track indication and in the position of classification signals on the car. The latter revision proposed front-end signals located at the middle of the car end instead of near the roof, providing for a definite indication of the direction of extras and sections that are passed on sidings, and it is somewhat surprising that the association in convention should have failed to approve a change designed solely to avoid confusion.

Practically the whole of the report of the association's committee on passenger traffic was devoted to consideration of one-man car operation, and although no definite recommendations could be made, the data submitted were remarkably comprehensive and especially valuable in view of the comparative novelty of this form of transportation unit. The finding that one-man cars are used by more than 30 per cent of the companies replying to the committee's inquiry was decidedly interesting, as was also the apparent limitation of the service to cities of 25,000 population. However, the statement of car-mile earnings averaging 14.5 cents with operating expenses of 12.7 cents was hardly encouraging. In fact it gave an impression of unprofitable lines that could hardly be operated at all if the one-man car was not used. Certainly so small a margin between revenues and expenses is not going to pay overhead charges and a profit besides, so that as it stands the one-man car can hardly be classed as having demonstrated its success in general. Nevertheless, the fact that but comparatively

few cars especially designed for one-man operation are as yet in service makes it certain that better results may later be obtained than are indicated by these figures, and since the report established the perfect practicability and actually improved safety of the one-man car, there are undoubtedly conditions under which it will prove decidedly advantageous.

Consideration of mechanical devices also constituted a large part of the report on fares and transfers, and it is very much to the committee's credit that its agitation of the necessity for issuing transfers mechanically should have resulted in the actual commercial development of such a machine within the last few months. In consequence, the strong argument that was contained in the report for a motor-driven fare box with the penny-counting mechanism eliminated may be expected likewise to produce results. In connection with the general subject of fare collection this committee cited the experiences of three companies with the use of front-end collectors at congested points. In two cities very good results had been obtained, but in one case a rather unsatisfactory statement was submitted, the introduction of the extra fare collectors effecting no increase in the number of cars passed through the congested district. As a matter of fact the movement of the cars in this instance was entirely dependent upon the traffic policemen, and in consequence the decreased loading time produced no improvement. Obviously, failure of front-end collection under such conditions cannot be ascribed to any inherent disadvantages in the system, and as the committee indicates in its conclusions, the value of this method may be said to depend largely upon the circumstances surrounding its operation.

As usual, the committee on express and freight traffic presented a very comprehensive and interesting report. One of the most significant facts put forward was that, judged on the basis of the railways making returns to the committee, the passenger earnings for 1914 were practically 1 per cent less than those of the previous year, while the freight earnings actually showed for the same period an increase of approximately 5 per cent. With this evidence in view it would be difficult to disagree with the implied belief of the committee that many expenditures now made with the expectation of making really negligible increases in passenger business might better be devoted to the cultivation of the far more fertile field of freight and express traffic.

Undoubtedly the discussion on the influence of stops on schedule speed in the report of the committee of schedules and time-tables was one of the most interesting features of all of the wealth of information presented during the course of the convention. Beginning with average figures obtained from a large number of tests in actual city service, the committee developed curves showing the relation between stops and schedule speed, and these indicated that, where a schedule with twelve stops per mile gave a schedule speed of 9.2 m.p.h., a decrease in the number of stops to eight per mile would increase the schedule speed to 10.8 m.p.h.—an improvement of 17 per cent, or more than enough to

make many a bankrupt road pay dividends. It would be difficult to provide a more potent argument than this for the skip stop or any other method of operation whereby the number of stops in city service could be decreased. Indeed, the importance of this phase of the committee's work can hardly be overestimated; primarily because the influence of stops on city schedules and, in turn, on operating expenses has been recognized only vaguely up to the present time. It is well worthy of continued study.

A BUSY YEAR FOR THE ENGINEERS

It is only when one contemplates the accumulated results of the year's work by the Engineering Association committees that he can realize how much there was to be done and still remains to be done. The year's work was not only well done, but the reports were completed promptly and carefully scrutinized by the standards committee. The following bird's-eye view of a few of the high points in the committee work may aid in forming a just estimate of the work.

The scope of the work carried through by the outgoing committee on equipment is extraordinarily extended, and one is led instinctively to wonder whether it would not be better in future to divide it, if necessary forming new committees, so that the present burden of detail borne by the chairman could be lightened. To the ensuing committee, for example, there have been assigned already three subjects for consideration at the suggestion of the standards committee, and in addition, there are investigations of such importance as those on the new designs for a standard journal brass, for a limit-of-wear gage for wheels, and for a standard brakeshoe, head and key, which have been submitted by the outgoing committee as requiring continued study. The investigation of any one of these matters, to say nothing of the new subjects that may be assigned by next year's executive committee, involves a great deal of individual time and effort, and it seems somewhat unfair to impose so much upon a single committee.

In this year's report the committee on power generation departed from its custom of submitting papers on special topics, and although it might be expected that the alternative of making specific recommendations regarding practice and standards would detract from the interest that has attached to previous reports, this proved to be anything but the case. In fact, the report outlined a method for analyzing power station costs that was decidedly novel and contained much material productive of study. In this were presented charts covering operating costs which were based upon the curve of "peak ratio," the reciprocal of the load factor, and it was suggested that this be adopted instead of the load factor as a basis for unit performances. Certainly, this plan has much to recommend it, and it will be interesting to see whether the proposal will aid in clarifying power station cost analyses.

The electrical engineers have contributed liberally

to this year's progress most tangibly in the report on power distribution. The specifications on overhead line material are a fitting complement to those on 600-volt, overhead trolley construction. They should be especially acceptable to the small road, for whose particular benefit they were prepared, in enabling it to buy as wisely as the large one with its corps of skilled engineers. These specifications will also simplify the preparation of others for a.c. and higher-voltage d.c. construction, which must be taken up soon. One of the most troublesome little but fundamental difficulties of an electrical nature has been that involved in specifying lightning arrester grounds. Signal operating conditions, electrolytic corrosion and ground resistance all come in to complicate the situation. A compromise seems now to have been reached.

Unquestionably the most notable contributions contained in the report of the committee on way matters were the specifications for track special work with particular reference to its physical and chemical properties, and the quality of workmanship. While in time, doubtless, these specifications will be amended to meet street and interurban railway track requirements, the provision of a definite working standard represents a long stride in the right direction. Moreover, the fact that the manufacturers were deeply interested in seeing these specifications adopted is another important point in their favor. Now that the specifications have been approved by the way committee, the manufacturers and the standards committee, they merit general use by way engineers, especially, so that any weaknesses that may develop can be corrected at the earliest possible date. With these definite standards, special work may be inspected at the mills in a manner which will meet with the approval of manufacturers, or when it is known that these specifications are to measure the quality of workmanship, the liability of controversy, even when special work is inspected at the point of delivery, is practically eliminated.

The feature of the report of the committee on heavy electric traction was a study of modern electric locomotives in which a comprehensive compilation was made of data regarding existing designs both in this country and in Europe. This disclosed a decided lack of uniformity in practically every factor entering into electric locomotive construction, and the committee was led to the conclusion that an attempt to standardize either electrically or mechanically would be premature. No doubt this is broadly true, but it is unfortunate that the committee did not have a chance to express itself (owing to the practically simultaneous dates of publication) on some of the details cited in connection with the ideal locomotive that was outlined in E. H. McHenry's paper before the International Engineering Congress. There would seem to be many points in favor, and few against, the latter's timely suggestion to limit electric-locomotive driving-wheel loads to some such figures as 40,000 lb., and consideration of this matter from a practical standpoint by the committee could hardly fail to be of great interest and real value.

The Industry and the Association^{*}

Electric Railways Confront Serious Problems Due on One Hand to the Attitude of the Public and on the Other to the Business Depression—More Active Participation of Lawyers and Manufacturers in the Work of the Association Is Desirable

By C. LOOMIS ALLEN

Allen & Peck, Inc., Syracuse, N. Y.

THE association appreciates the support and the loyalty that has always been accorded by its Pacific Coast members, and it was very largely with the idea of showing appreciation of that support and loyalty that it was determined by the executive committee in 1913 that in 1915 the association should hold its convention at a point where its Pacific Coast members could observe at first hand its methods and manner of working, and the association could receive the benefit that would come from the discussion and suggestions of its far Western members. In the early days of the association it was the habit to hold the annual convention in cities in different sections of the country, but when it was decided to hold the 1909 convention in Denver many of us were apprehensive as to the result of holding the meeting in a city so far west. But the benefits to the industry and to the association warranted the expenditure of the money and the sacrifices of time necessary for the journey. In voluntary associations similar to the American Association interest in the work and the welfare of the association can best be engendered and continued when its mem-

bers are in close touch and are each doing some definite thing for the industry or the association.

The association, in its personal contact with the Pacific Coast members, expects to receive an inspiration and impetus that will make for bigger things to the industry and the future work of the association.

The field is a large one and workers with energy and ideas were never in such great demand as they are at the present time.

The committee which has had in charge the arrangements for this convention has done its work well. It has been fortunate in that its membership included capable men on the Pacific Coast who have taken care of the thousand and one details in a highly creditable manner.

As in former years, the committee on subjects has been charged with the duty of providing suitable programs for the midwinter meeting and for this convention. It is sufficient to say that the program prepared for the midyear meeting could not have been improved upon. The program for this convention likewise merits the approval of the delegates.

The Electric Railway Industry

Much has been said in recent years as to the extent to which our industry was suffering from the attacks of political demagogues and irresponsible reformers, but serious as has been the effect of these attacks, it passes into insignificance as compared with the situation that has confronted the electric railway industry during the past twelve months. Municipal ownership, partnerships with municipalities, state regulation and home rule have from time to time been sources of great concern to the owners of electric railway securities and to those who have been responsible for their successful operation. Business depression has prevailed throughout the United States, with few communities excepted, and has wrought such havoc in the earnings, both gross and net, as to most seriously affect the values of securities that have been purchased by investors and has almost completely destroyed the market for electric railway securities with the private investor. Perhaps figures can best demonstrate the condition of our industry.

The bureau of fare research, in our home office, receives monthly the statements of gross earnings, operating expenses and net earnings from a large number of our members. A combined statement from twenty-five of the larger companies in different parts of the country, selected not with a view of seeking extreme conditions, shows that for the year ending June 30, 1915, there was a decrease of \$3,601,948 in gross income, a decrease of \$1,516,025 in operating expenses, and a decrease of \$2,083,394 in net income as compared with the year ending June 30, 1914.

Based on these figures, it can be truthfully said that the gross earnings are showing a decrease over the previous year, operating expenses a relative increase over the previous year, and that the result is a consequent large decrease in the net earnings. This condition does not permit a very attractive statement to be presented to the investment banker or private investor, nor does it permit the conscience of the fair-minded utility man to urge the private investor to invest in securities of electric railways.

The desire on the part of the electric railway men to

^{*}Annual address of the president of the American Electric Railway Association delivered on Oct. 5, 1915, before the convention in session in the Native Sons of the Golden West Building, San Francisco, Cal.

render high-grade service and to meet the wishes of the patrons of the electric railway and the reasonable orders of public service commissions in relation to service, is necessarily restricted by reason of the falling off in net earnings and the consequent failure to interest capital so that improvements can be made that will permit of the higher grade service.

In the operation of the electric railway four parties are at interest—the public, which is the consumer; the employee, who gets his living from the money paid by the consumer; the state and the municipality, which in the form of taxes, receive a share of the earnings, and the investor, who gets his money in the shape of bond interest or dividends on capital stock. If we are to have successful railway operation, all four parties at interest must be satisfied, which means that each must be reasonable in his demands. If the public makes demands for unnecessary service, or for rates that are too low, labor and capital, state and municipality, one or the other or all of them, must forego their fair share. If labor is unreasonable in its demands for increased wages, if the state and municipality take an undue share of the earnings in the form of taxes, and if the rates of fare are too low so that the capitalist is made timid and is fearful that his investment will be jeopardized or made less valuable, the man who has the cash to invest will shrink from the purchase of electric railway securities and put his money at work in other fields where the consumer, laborer and the taxing powers will

permit him the security for his capital and a rate of return on the money that he advances which makes it attractive to him.

This is not a theory that confronts the industry—it is a condition—and never has it been quite so clear to the electric railway industry as at the present time. It would seem as if it was but an ordinary business proposition to convince the American people that our business is no different from any other business and that successful business corporations are the corporations that build up the country. No municipality was ever built or prospered by the aid of business concerns facing failure or financial embarrassment. Quality of service to our patrons or consumers is dependent wholly upon the securing of capital to provide the facilities for rendering such service. Put the industry in a position so that capital is attracted to it, and high-grade service can and will be rendered to the consumer. Let the conditions now prevailing throughout the country in the matter of rates of fare, demands from employees for higher wages, the enactment of more stringent laws, or of new forms of taxation, and we will continue to have, until some of these conditions are modified, a timidity on the part of the investor—affecting not only the sums of money now invested, but which will bring about an absolute lack of the offering of new capital, so necessary to the electric railway industry if it is to render that “good service” which we all desire to give to our patrons.

The American Electric Railway Association

The association offers to its members, through its officers, executive committee and standing committees, a means of putting before the American public in such form as can be easily understood, the facts which should make for a better understanding by the American public of the unfavorable conditions that confront the industry and of the remedies that are necessary to put the industry in such a position that the development of existing lines, the extension into new territory and the building of new lines in undeveloped territory will go forward.

President Wilson said to us in Washington: “So I say that if your earning capacity is the capacity to earn the public confidence, you can go about your business like free men. Nobody is going to molest you and everybody is going to say, ‘If you earn big profits; if you have treated the people from whom you are making your profits as they ought to be treated; if you treat the employees whom you use in earning those profits as they ought to be treated; if your methods of competition are clear and above reproach; why, then, you can pile these profits as high as the Rockies and nobody will be jealous of it.’ Because you will have earned them in a sense that is the handsomest sense of all.”

Surely, the President points out a course that should be easy for us in the electric railway industry to follow. We must take the people into our confidence—not partially, but completely. We must treat our consumers and patrons fairly, and we must treat our employees as they ought to be treated. Have we not been derelict in our duty to the industry by a long period of almost unbroken silence and a complete failure to inform the public as to the real conditions confronting the industry? Have we not been too content and too self-satisfied and taken the business offered to us without any sufficient effort to sell our product in the same manner that the merchant undertakes to sell his product? The merchant of to-day does not place his goods on the shelf

and wait for the customer to come and select the things that are absolutely necessary to him. On the other hand, he proceeds to sell his goods by informing his patrons and consumers of their high quality and in offering them in the most attractive method possible, and he so makes a satisfied consumer.

Our membership, both company and individual, stands back of and is pledged to the truths laid down in our code of principles, and the tenth principle in that code is, “Full and frank publicity should be the policy of all transportation companies to the end that proper information may be available to the investor and the public.” Let us proceed to translate these words into deeds.

The activities of the American Association during this last fiscal year have greatly increased in extent and efficiency, and I believe mark a milestone in association work of which we may all be proud. It would take me too long a time to enumerate all of these activities or to pay proper tribute to those to whose enthusiasm and hard work they are owing, but it is my purpose to call attention briefly to some of the most important.

It was determined early in the year to hold the mid-year meeting in the city of Washington, and two committees, one representing the American Association, the other the Manufacturers’ Association, were appointed and worked out the details of this meeting. A program of excellently prepared papers occupied the time of two sessions of the association, and President Wilson, at the afternoon session, in one of the most important addresses he has yet made, clearly announced the policy or attitude of his administration towards the business interests of this country. The dinner in the evening was well attended, and it was with the satisfying knowledge that the meeting had been a great success that the members left for their homes.

The committee on the cost of passenger transportation service has completed in a year and a half the work which, as outlined, would ordinarily have taken three

years. The volume containing its report will be printed and distributed to member companies about Nov. 1, and it is sufficient to say that it is the best authority or book extant dealing with the relation between elements of cost and the elements of service in electric railway transportation.

I feel that the committee on public relations, although hampered by lack of funds, has at least laid the groundwork for its future usefulness to the industry. An enthusiastic meeting was held in January of this year, at which the work to be accomplished was placed in charge of sub-committees and a bureau of public relations was organized and a director appointed. A very large amount of time and thought was devoted to means and methods, and it seems certain that during the ensuing twelve months decisive progress will have been made in the work which the committee proposes to accomplish.

The committee on federal relations this year has once more demonstrated its value to the industry. As the result of a hearing arranged by that committee before the Interstate Commerce Commission on the question of the jurisdiction of the commission over purely urban electric lines in the matter of the reporting of accidents the commission has rendered a decision favorable to the companies. As this has been a point in dispute between a number of companies and the commission this decision is an important one.

This year there has been organized a committee to deal with a subject second to none in its importance to the industry. Our committee on valuation, while proceeding with the care and deliberation that the importance of the subject demands, has completed its organization and will, without doubt, present within a reasonable time a report that will be of great value to every member company.

A special committee was appointed last May for the purpose of investigating the question of the amount of dues paid by members of company sections. This committee has gone into the subject carefully, and in its report to the executive committee recommended that the dues of such members be reduced from \$5 to \$2 per annum. The executive committee has approved this change and a proposed amendment to the constitution was sent to all member companies some thirty days ago for action at this convention. Those of us who have studied this question believe firmly that this reduction will result in considerably increasing this class of membership. In my opinion, the company section movement, inaugurated in this association with the organization of The Milwaukee Railway & Light Company section on March 18, 1912, is one of the most important and at the same time least appreciated factors for good at the command of our member companies. An investigation of the workings of any one of the six company sections now in existence, ranging in membership from twenty-five to nearly 400, will convince any executive that the formation of such a section upon his property will prove an immediate asset which will bring results of the greatest benefit both to the company and to the men.

The committee on education has during the past year inaugurated educational courses for shop, power house, line and track employees of member companies. Very wisely, in my opinion, it has turned over to a recognized institution the details of solicitation and distribution, while maintaining a strict supervision over the subject matter. In this way it has been able to put at the service of such employees an opportunity for thoroughly educating themselves in their work at a moderate cost.

The industry is under a debt of gratitude to the heirs of the late Anthony N. Brady, who have authorized the American Museum of Safety to make an award of a

gold medal to the company which each year does the most toward conserving the life and health of its patrons and employees. Reports submitted in the competition during the year 1914 evidenced the great interest that electric railways are taking in the matter of accident prevention, and the winning company, the Boston Elevated Railway, may well be proud of having secured this award in the face of the competition it had to meet.

Throughout the year the association's magazine, *Aera*, has maintained its usual high standard. As time goes on the value of the magazine becomes increasingly evident. It is the official mouthpiece of the association and offers a means of communication between the organization and its members. It is accomplishing substantial results in its treatment of problems confronting electric railway officials and employees, and one of its most important functions, which it has fulfilled admirably, lies in the giving of widespread publicity to the executive and operating viewpoint of electric railway problems. During this year 367 railway men have contributed material for publication in the columns of the magazine. The necessary and material support furnished by the manufacturers during the past year is greatly appreciated. More and more it is being impressed upon those engaged in this important part of the industry that *Aera* is their magazine and in supporting it they are aiding one of the great forces of our industry.

Last year at the suggestion of this association there was organized a national joint committee on overhead and underground line construction. This year, through its representatives on the joint committee, the association has been an active participant in the work. This committee has a large field of important work before it. The various interests represented in the organization of the joint committee are working in harmony with a hearty spirit of co-operation. The results of its labors will be of great value to the electric railway industry and other utility interests.

Mention should be made of the participation of the association's representatives in the conference called by the United States bureau of standards to consider its proposed safety rules. By means of inquiries addressed to its member companies, the association is collecting a considerable amount of valuable data for the use of our representatives. In this work various state and sectional associations have been invited to co-operate with us and the response to this invitation indicates that the work of our representatives will have an important influence upon the character of the rules to be finally promulgated by the bureau of standards.

That the association is an instrument which at any time can be used to further the interest of the industry was proved by the way in which the question of jitney buses was handled during the past year. Coincident with the appearance of the jitney bus, a special committee composed of four executives was appointed to consider and to make recommendations to the various companies as to the manner in which the menace of the jitney could best be treated. Within a surprisingly short time a report was prepared embodying a very extensive and close study made of the situation by the four gentlemen serving on this committee, and was accompanied by a statistical and technical study of jitney-bus operation prepared by the bureau of fare research. The committee has also arranged for the supplying of the companies with much supplemental information. This was emergency action and clearly demonstrates that in the association the industry has that central organization which is absolutely necessary to meet emergencies of such serious import.

During the year the association's offices in New York

were moved from the building of the Engineering Societies at 29 West Thirty-ninth Street to a new building at 8 West Fortieth Street. The force at headquarters had worked under great disadvantage due to the unsuitable arrangement of the offices. Such arrangement did not permit of an economical use of the space paid for, nor for the efficient transaction of the large amount of work handled. The question was considered carefully by the executive committee and the decision to move was arrived at after several months of study. The new quarters afford an efficient working layout and a saving in rent this year of about \$1,700 and an annual saving thereafter of about \$1,200.

With our affiliated associations the trend has been in each case for progress. The accomplishments of these twelve months will compare most favorably with any similar period in the past. During the year thirty-eight committees have been at work. The results of their studies and investigations are set forth fully in the reports to be presented at the various association meetings.

In the Accountants' Association, the committees on express and freight accounting and passenger accounting will present a joint report on the allocation of expenses, which will be useful to many of our companies. The joint committee on engineering-accounting has started upon a work which, when completed, will be of great value, and a great number of our companies will welcome its helpful suggestions regarding inventory methods.

In the Engineering Association, the report of the committee on way matters is particularly timely in its recommendation of a standard specification for special work. The specifications submitted by the committee on power generation for fuel, lubricants and boiler tubes will also prove interesting and valuable.

The Transportation & Traffic Association takes a notable step in the institution of a committee on standards. This committee has before it a work of the utmost importance in the standardization of the methods employed in the transportation end of the industry. It brings forth important recommendations as to procedure in the association. Reports of the other committees bear testimony to the fact that the Transportation & Traffic Association is abreast of the times.

Your president, in accordance with past procedure, begs to submit for your consideration the following recommendations:

It seems desirable that the knowledge and experience of those officers of our member companies connected with the legal department be utilized for the benefit of the association and the industry as a whole, and with this in view, I recommend that consideration be given to a plan for bringing the members of the legal department more closely in touch with association work.

In the development of association work and activity, it has been clear to many of the past officers that there was a force vitally interested in the success and progress of the industry which has never been fully recognized or given its proper place in association life and activities, and I refer to those individuals who, though not directly engaged in electric railway operation, make their living from the manufacture of material and supplies that are used specifically in the electric railway industry.

During the period of reorganization of the American Street Railway Association, there was organized as an allied association the American Electric Railway Manufacturers' Association. Our own association has never fully recognized the worth, the strength and the help that the members of that organization can bring to the industry. Our engineers, our accountants, our transportation and our claims organizations are our children—we call them affiliated associations. We have been prone to make use of the Manufacturers' Association in times when they were useful to us, and when we have asked for their assistance it has always been most cheerfully given. The time has now arrived, in my judgment, when full recognition should be rendered to the Manufacturers' Association and a proper charter granted by the American Association, so that it will be co-equal and recognized in all ways the same as the Engineering, Accountants', Transportation & Traffic and Claims Associations.

Some of our member companies in the American Association have undertaken the great work of educating their employees in the details of the industry from which they earn their living. It is a most admirable work and one that will bring most favorable results to the industry when it reaches its full fruition. Some of the smaller companies have undertaken to do this to a lesser degree, and all members recognize to-day the great power for good that the employees engaged in the electric railway industry can have upon our difficult problems when they are educated as to what these details and difficulties are. By taking fully into our confidence and granting the necessary rights and charter to the manufacturers, we will bring to the industry another large body of men who are dependent upon the industry for their living, and who, when they are told the story of what we are trying to accomplish and the difficulties that are encountered, will add thousands of men to the forces that will make for a better understanding on the part of the public as to our problems.

I have talked to the executives of some of the manufacturers and they realize the possibilities that have heretofore remained unused, and I can say to the members of this association that the plan which I suggest for your earnest consideration has their full approval.

Mr. Allen's Quartet of Interests

"I*N the operation of the electric railway four parties are at interest—the public, which is the consumer; the employee, who gets his living from the money paid by the consumer; the state and the municipality, which in the form of taxes, receive a share of the earnings, and the investor, who gets his money in the shape of bond interest or dividends on capital stock. If we are to have successful railway operation, all four parties at interest must be satisfied, which means that each must be reasonable in his demands.*"—C. LOOMIS ALLEN.

The Value of Railway Statistics*

Executives and Accounting Heads of Electric Railways Are Realizing Benefits of Statistics in Administration—Various Financial Statements Are Explained from Point of View of Valuable Statistical Information Obtainable Therefrom

By GEORGE B. WILLCUTT

Secretary United Railroads of San Francisco, San Francisco, Cal.

EXECUTIVES are realizing more and more the benefits to be derived from electric railway statistics, and consequently are constantly calling for new and additional information of this character. The most general compilation of statistics, and one universally adopted, is that contained in the various forms of reports issued by railways. The simplest form of monthly report usually embraces a balance sheet, an income statement, a statement of additions and betterments, and occasionally a statement of profit and loss. Of these the balance sheet, from its comprehensive character, is unquestionably the most valuable collection of statistics available for the executive and financial heads.

BALANCE SHEET STATISTICS

It is true that every fluctuation in the financial condition of a company is reflected in the surplus as it appears upon the balance sheet, and that the statement of income and profit and loss for any given period will disclose the details of the difference which exists between the surplus at the beginning and the surplus at the end of the period. Yet there are many other fluctuations in financial conditions which have a vital bearing upon the company's existence and which are not reflected in the income. Too much emphasis, therefore, cannot be laid upon a comparison of the principal fixed assets for the purpose of determining the increases thereof, because such increments disclose the essential disposition of the funds of the company.

A comparison of the current assets of an electric railway, as between two dates, is also important. The value of such a comparison lies primarily in the fact that under normal conditions there should be no great amount of current assets, it being assumed that materials and supplies are not included under this caption. In general an electric railway collects its money as it goes. If it has miscellaneous properties, however, it collects rent. As a matter of accommodation, it sometimes sells a little power. Aside from its regular passenger business, it may also transport freight or other commodities. When the payments for such services are not currently made, the items appear as current assets in the balance sheet. If, therefore, there is any perceptible or distinctive increase in the current asset figures, it is evident that the collections are not being properly made, or that, more to the point, funds are being diverted

in the way of advances to subsidiary companies or to individuals, etc.

Any fluctuations in the fixed debt of the corporation should be ascertained, and if an increase is shown upon the balance sheet, a search should be made for a corresponding increase in the fixed or other assets. If there is not in gen-

eral a uniformity in the increase of the fixed debt and the fixed assets, the question immediately arises as to what disposition was made of funds raised; or, on the other hand, how funds were raised if not disclosed among the liabilities.

An increase in the current liabilities of an ordinary public service corporation suggests that the bills owed by the company are not being paid promptly, or that unusual expenses perhaps involving construction have been incurred. In any event, such fluctuations awaken immediate inquiry, the primary end of any statistics.

INCOME STATEMENT STATISTICS

The income statement, as usually prepared, embraces revenues from the various sources, as well as operating expenses, fixed charges and surplus for the month and fiscal year to date with sundry detail statements supporting the same. The form involving accounts for the fiscal year period accrued to date is of much benefit as representing a fair average condition for comparative purposes, but the monthly comparison, in spite of so much time and attention being devoted to its preparation by most companies, unfortunately in many cases has not afforded the satisfactory results expected.

Despite efforts to avoid fluctuations by prorating charges so as to distribute them in an equitable manner over the time that is actually covered by them, sundry and numerous charges for undue amounts occasionally appear. These sometimes result from the operating department forces being engaged in such months upon more than the average amount of work charged to operating expenses and to a lesser extent upon that of an addition and betterment or accounts receivable character, though the total payroll and consumption of material may remain about the same. Deferred and delayed charges beyond the knowledge or control of the auditing department result in lighter charges one month, with a corresponding increase when later received. These fluctuations for lengthy periods are equalized and furnish the true average cost of operation, but the comparison of monthly expenses, for the reasons referred to, generally involves much labor without corresponding satisfactory returns.

*Abstract of a paper delivered before the San Francisco convention of the American Electric Railway Accountants' Association on Oct. 5, 1915.

Much has been written and discussed as to the merits and advantages of the different units of comparison, but without doubt it has been the experience of most companies that no one unit will satisfactorily meet the requirements for the details of the many accounts. Percentage-of-gross-earnings, revenue-passenger, track-mile, car, car-mile, car-hour, car-day and kilowatt-hour bases, etc., all have their merits, and frequently it is necessary to make comparisons on more than one basis to gain the greatest advantages. On whatever basis compiled, the resulting figures are merely an indication of certain conditions existing, all of which must be thoroughly analyzed and investigated to obtain the real, true and full facts and benefits therefrom.

PROFIT AND LOSS STATEMENT

The form of monthly report should include a profit and loss statement showing in full detail the character of the various entries, which, by reason of their direct bearing upon surplus, are of the greatest importance. These should receive careful consideration by the executives in connection with the remaining report figures submitted.

With companies maintaining renewal or depreciation accounts, a full detailed statement of all charges against such reserve accounts should be prepared and made an essential part of the report, as otherwise many expenditures or obligations incurred would fail to receive the proper attention. The provisions of the Interstate Commerce Commission's system of accounts and the accounting requirements of many public utility commissions, demanding the creation and use of renewal and depreciation reserves, will undoubtedly lead to the preparation and incorporation into reports of the statement suggested where this has not already been done.

STATEMENT OF ADDITIONS AND BETTERMENTS

A statement of additions and betterments is generally made a part of the monthly report, but such a statement should show explicitly the full details of the work. Thus it would advise the executives fully as to the work performed during the month, and would also act as a check upon the mechanical and operating departments, which, with a natural desire to reduce their operating expense accounts, occasionally distribute more to addition and betterment charges than an impartial and conservative action would warrant.

Similarly a statement of work performed other than for the company and charged to accounts receivable could be compiled and included in such report to advantage. This should show the various pieces of work under way, the charges to each during the month and the cost to date.

MISCELLANEOUS STATISTICS FOR EXECUTIVES

Supplementing the foregoing statements, others may be prepared. For example, one showing the main details of bills and accounts receivable, and also of bills and accounts payable, as noted upon the balance sheet in totals, will enable the executives to keep in closer touch with such assets and liabilities and to take such action as conditions may require.

A full and complete analysis and statement of sinking fund accounts, showing the invested and the uninvested portions, with detailed lists of securities in the former and the cost prices thereof, cannot fail to prove of interest and service to the officers and directors and to keep them fully conversant with the actual requirements and conditions of such funds.

Detailed statements of "other securities" held in the treasury as temporary investments or otherwise should also be prepared and furnished. These, with the corre-

sponding statements of sinking fund securities, will act as a guide to the officers and directors in connection with any inspections and checking of such securities that they must make.

There are probably no ledger accounts which come in for more attention and criticism from the public auditor in his periodic examinations than unadjusted or other suspense accounts, and none which require more detailed or specific analyses and explanations. Innumerable charges and credits may be involved in the figure shown on the balance sheet, and sometimes for considerable amounts. To furnish full information such entries should be shown separately under proper and distinguishing captions. When suspense accounts are used, a detailed and full analysis should always be prepared, supplementing the net figure shown upon the balance sheet and showing a comparison with corresponding figures of such date as the occasion or conditions warrant.

The usual form of balance sheet comparing totals with corresponding figures of a year previous is of much benefit, as it reflects the business of the year. By reason, however, of the cumulative character of the figures involved, a comparison of the figures of one month with those of the month previous is of further benefit in directing attention to transactions which have occurred since the issuance of the previous yearly statement. To obtain the full benefit therefrom, explanations should be rendered for the fluctuations shown.

While the extent to which the smaller details of the operating, revenue and expense statistics are inspected and considered by the chief executives depends upon the organization of the controlling corporation, those bearing upon the receipts by lines and the principal expenditures for maintenance of track and roadway, maintenance of rolling stock, operation of cars, power expenses and the heavier subdivisions of miscellaneous and general expenses, are unquestionably of much service to them. Among the latter class of statistics, various data and compilations involving injuries and damages, such as lists of the various kinds of accidents with fatalities resulting therefrom, statistics as to claims presented and rejected, settlements effected, damage suits pending, expense of claim and legal departments for the period, car-mileage and passenger figures based on accidents occurring, will also prove of much value.

A general statement of receipts and disbursements for the period since the previous report, properly subdivided, will be of benefit to the executive heads on many occasions, and when supplemented by additional data showing by firms, etc., the heavy or otherwise extraordinary payments which have been made during the period, will in sundry instances prove of special interest. Incident to the disbursements, a report can also be furnished showing the numbers of employees and the total amounts of monthly payrolls by departments, with the same information for the portion of the fiscal year accrued to date.

Statements covering (a) extensive pieces of work under way with costs to date and further expenditures of labor and material required for completion, (b) heavy purchases to be made in the near future and (c) capital and other large and unusual payments of any character required to be made in the next thirty to sixty days, will prove of great benefit and assistance to the executives.

A "forecast," compiling the receipts of the company for months ahead as estimated or otherwise determined and the known or estimated expenditures during the same period in fullest detail, will prove valuable to all interested in the financial prospect of the company, many of whom are frequently at distances remote from

the railway itself and planning and working to finance the property and to provide funds to meet its requirements. It is surprising under ordinary circumstances to find how close one can compute, largely on an average basis, the various classes of receipts and expenditures involved.

The cost of money does not receive in all cases the full share of attention which it requires. At times like the present, when money is scarce and interest rates are high, the subject becomes of great importance. When fully and accurately determined, including all expenses in connection with new loans or extensions, sales of securities, etc., the cost of money is found to be far different from what it appears after a casual or less thorough study of the subject. The interest, discount, commissions and sundry incidental expenses frequently result in a figure from 30 per cent to 40 per cent in excess of the nominal rate.

STATISTICS FOR ACCOUNTING HEADS

It is almost unnecessary to refer to the value of statistics to accounting heads, as such are the essence of accounting and auditing work. It may be said, however, that analyses of many of the items appearing on the trial balance are most essential. Besides the many

detailed statements of balance sheet entries, etc., previously suggested for reports, similar ones for interest earned on bonds, notes and other securities with maturities; insurance and taxes, etc., paid and unexpired; interest payable on bonds and notes, and other accruing liabilities will enable the accounting heads to determine the correctness of the various balance sheet entries corresponding thereto. A most important detail is the analysis and prompt checking of entries of bond interest paid and unpaid each month by a comparison of the actual number of each series of coupons unpaid, as shown by an examination of the books or records in which the paid coupons are filed, with the ledger records of them. Any discrepancy existing between the two sets of records should be immediately investigated, for a delay in so doing would probably render the correction much more difficult.

The principle of making an inventory of insurance and taxes paid in advance should be occasionally applied to the more tangible assets, such as material and supplies, live stock and miscellaneous equipment, railway cables (cable operation still being a material factor with a few railway systems), etc. These statistics will enable the accountant to determine any adjustment entries required to correct the figures upon the balance sheet.

The Evils of Government Ownership*

Tendency Toward Centralization of Power Needs Checking—Government Enterprises Have Not Been Efficiently Conducted—Government Ownership Tends to Destroy Individual Initiative and Removes Hope of Reward—It Necessitates a Changed Concept of Government

By JONATHAN BOURNE, JR.

Formerly United States Senator from Oregon

Copyright by
G. V. Buck, Washington, D. C.

THE problem of municipal ownership of public utilities involves no fundamental principles different from those involved in the problem of national ownership of such utilities as railways, telegraph lines, water powers, etc. The difference is one of degree and detail rather than of principle.

I am strongly opposed to public ownership, whether municipal or national, except in those cases where it is necessary to have government control in order to promote the public health, as in the case of water supply systems. My opposition is based not so much upon the question of relative cost of operation as it is upon the effect public ownership has upon the government itself, and upon the enterprise of its citizens.

In a comparative way, it matters little if cost be increased and efficiency reduced. More expense and less convenience are ills of a superficial nature and do not affect the larger interests of the people in a vital way. But the bad effect of public ownership upon the government itself, whether municipal, state or national,

is of more than temporary concern and cannot be measured in terms of dollars and cents. The evil effect of public ownership upon the creative, constructive spirit of enterprise among the most active and capable of our people, constitutes a menace not only to the welfare of this generation but also to our continued progress.

The desideratum of all government should be the protection of its citizens and only such restraint of individual action as is absolutely necessary to insure the desired protection of all its citizens. As an incentive to individual enterprise and as a stimulant to individual initiative, the government should afford every citizen the largest opportunity for activity with hope of commensurate reward consistent with the rights of all.

Public ownership tends to destroy this initiative and to remove the hope of reward. Except in rare instances, it tends to discourage efficiency by removing competition. This is true in the case of both municipal public utilities and national utilities.

Once established, public ownership will continue until its destruction has been wrought. Once overthrown, individual enterprise will not be restored until public

*An address delivered before the San Francisco convention of the American Electric Railway Association on Oct. 6, 1915.

ownership has brought its own ruin. Legislation can easily destroy but it cannot build up. The most it can do is to give opportunity and incentive for individual activity.

The objection based on the effect of public ownership upon government itself is particularly applicable at this time when there is such a strong tendency toward the centralization of governing power in the hands of a few. We observe this tendency most strongly in municipal government where the city commission is supplanting the city council. With this concentration of power necessarily goes not only responsibility for the exercise of that power, but opportunity for its selfish use. Selfishness and ambition so generally control human action that great delegation of power will always be a menace to popular government. I grant that, in most instances, where power and responsibility have been bestowed upon a few individuals, there will be, in the early stages of the exercise of that power, a special effort to render efficient and satisfactory service. This will be true for two reasons: (1) Public attention will be centered upon the management of the office in which power has been centralized, and, (2) with the change in powers of the office there will go a change in the selection of the incumbent with special effort to secure the services of a man who will be both capable and faithful. With the novelty of the change worn off, and with public attention diverted, there will be placed in power men who will use their authority to promote their own political, personal or financial self-interests.

That they would have the power to do so is readily apparent. If we were to add to the present number of government civil employees all those who are now employed by railway, telegraph, telephone, electric railway, express and water transportation companies, we would have a force of government employees numbering more than 3,000,000. In the last ten Presidential elections, the President has been chosen by a plurality varying from a little more than 7000 to 2,500,000. I have no hesitancy in asserting that under government ownership of all these public service corporations, those employees and their friends would invariably control the government under our political system. There would be insistent demand for service in governmental employment. Outside labor would strive to secure government employment. There would be dissatisfaction in private enterprise.

Thus, there would be established in the public mind the view of the government as an employer. The individual citizen would be encouraged to look upon the government, not as an institution which he should support, but an institution which should support him. With a multitude of government positions available, the citizen denied the privilege of government employment would feel that he had been discriminated against. The higher wages paid, the fewer hours of labor and the longer vacations accorded to government employees would cause constant unrest among those engaged in private enterprise of practically similar character of work and requiring a corresponding degree of ability and effort. There would become deeply embedded in the minds of the people the idea that the government is a great entity, separate and distinct from themselves, to which they can look for every service they may need. This attitude of mind would be entirely destructive of that spirit of patriotism which is nourished by the citizen who regards himself as a supporter of the government rather than its dependent. Instead of studying to devise a new and desirable service which he himself can render in return for satisfactory compensation from his fellow citizens, his tendency will be to

think of some new service the government can render for him.

An employer of workmen in private enterprise would come to look upon the government not as an aid to him through maintaining of equal opportunity, but as a rival since the government would be competing against him in the employment market. Where the activities of the government are limited, as they now are, to practically those operations which are necessary for the preservation of public peace, health and safety, that rivalry in employment between public and private enterprise does not exist, but just to the extent that the government engages in undertakings which can as well be left to individual enterprise, it becomes a competitor with its own citizens and the destroyer of equal opportunity.

The magnitude of the public service, under a system of government ownership, would inevitably throw public employees into politics and make them a factor in every campaign, municipal, state or national. While it is true that in former years public service corporations were a factor in politics and had undue influence in nominating conventions, that situation does not exist to-day. Public service corporations are not a controlling factor in American politics and their managers have no more influence than should be exercised by any other citizens having similar personal and property rights and interests.

Instead of taking public service institutions out of politics, public ownership would throw them into politics. For the purpose of promoting their own selfish interests, public employees would organize and pursue whatever means might seem most likely to secure legislative and administrative changes for the advancement of their own interests. Their influence would be directed to the support of that candidate who promised most for the fulfillment of their desires. Aided by an organization of public employees scattered throughout city, state or nation, an administration would possess a practically overwhelming advantage over any party or faction which sought to succeed it.

Some people profess to believe that the political influence of an army of public employees could be overcome by the establishment of a system of classified civil service examination. Theoretically this is true, but it must be remembered that although appointments may be made in part as a result of competitive tests, yet in every system of government employment the higher officers control promotions, demotions, transfers and removals, thus exercising such power over subordinates as to make them practically subservient in politics, where the administration in power is concerned. The President of the United States, the governor of a state and the mayor of a city have under their direction a body of men who may be easily organized as an active factor in politics.

Whether that organization shall exert its influence in support of the administration or against it will depend upon the attitude the administration has maintained toward the employees themselves. The extent of the influence of the employees will be measured largely by their numbers. So long as government activities are limited to ordinary government purposes, this influence will not be a menace. If extended by adding to the present government employees all those engaged in public service enterprises, the influence would be large enough and active enough to wield the balance of power in every political campaign.

Advocates of government ownership of public utilities assert that government regulation has been a failure, and assume that government ownership and operation will be a success. But possession of a certificate of appointment to public office does not bestow upon the

recipient any supernatural powers. The men who have been unable to solve successfully the problems presented under government regulation will likewise be unable to solve the problems presented by government operation. Quite likely their mistakes and shortcomings would be less conspicuous, but since they would have more problems to solve it must be assumed that their mistakes would be more numerous.

Every question of rates, character of service, or protection against unfair discrimination, which is now presented for the consideration of regulating commissions, would also be presented for determination by a board having control under public ownership.

If any man believes that government ownership will solve the rate question, let him study the parcel-post rates established by the Postmaster-General, under which the postage charged for a long haul is greater than the sum of two charges for two shorter hauls making up the longer distance.

If any man believes that discrimination can be avoided by public ownership let him study the facts in the blue-tag order under which in 1910 the Postmaster-General ordered certain publications transported on freight trains, although paying exactly the same rates and therefore entitled to the same service, while competing publications of practically the same character and catering to the same trade were transported on mail trains.

Let every student of this phase of the subject consider the manner in which the lines of the Federal Reserve Bank districts were drawn, resulting in favoritism to certain sections of the country.

Let him keep in mind the efforts of the Secretary of the Treasury to extend special financial favors to certain districts and certain industries.

If there can be such discrimination in the postal service and in the management of the Federal Reserve Banking system, upon what theory shall we assume that there would not be discrimination in the government operation of railroads, telegraph and telephone lines, and other public utilities? Under government ownership of the telegraph there would be swung over the heads of the press of the country a club no less threatening than that which now swings over the heads of the bankers of the country.

As I have already indicated, the question of cost and efficiency under government ownership is of relatively slight importance. It is of little consequence compared with the problem of keeping our government free from paternalism, giving equal opportunity to all citizens and encouraging individual enterprise, and yet this economic question must not be overlooked. No doubt the government as owner and operator of public utilities could make some improvements, and eliminate some duplications that would result in diminished cost of operation, but these savings would be more than offset by waste, increased expense and diminished service in other respects.

Many people assume that our own Post-office Department is efficiently and economically conducted, but reference to the report of the joint Congressional committee on railroad mail pay, submitted to Congress on Aug. 31, 1914, and published as House document No. 1155, will show by citation of numerous instances that government methods of accounting are inadequate and unreliable, and that supervising officials are vacillating and unbusinesslike in the handling of large problems presented for their official determination.

Study of the records of the reclamation service shows that in a large number of instances government engineers, in whom great confidence was placed, made estimates of cost of construction which proved so grossly inaccurate that settlers were deceived, to their injury.

The records of the forest service show that during the period from 1900 to 1914, inclusive, the total receipts from sales of timber, grazing privileges, timber settlements, fines, etc., amounted to \$17,060,528, while the government expenditures for the maintenance of forest service amounted to \$40,927,109.

Across the border in Canada we have had a very practical and convincing demonstration of the kind of efficiency we may expect from public ownership. Canada undertook the construction of the National Trans-Continental Railroad from New Brunswick to Manitoba, 1804 miles in length, and government officials estimated the cost at \$61,415,000. By the end of 1914 the commission having charge of construction had spent a total of \$173,000,000, or \$95,899 per mile, or nearly three times the original estimate. Another commission was appointed to investigate the work of the construction commission, and reported that \$40,000,000 had been absolutely wasted through bad judgment, carelessness or maladministration. The character of construction was in many instances not suited to the territory traversed, or determined by a judicious estimate of the traffic to become available. Incompetence was apparent in almost every branch of the work. The road cost three times as much as other roads constructed by private enterprise. The company which had agreed to lease, equip and operate the new line refused to carry out its agreement on the ground that the road was not completed even after the enormous expenditure stated, and that, because of the large construction cost, the company could not pay a rental equivalent to 3 per cent on the capitalization, as provided in the agreement.

These practical illustrations of results of government ownership and operation are exactly what might reasonably be expected. It would be absurd to expect that the government could pay higher wages, reduce the hours of employees, dispense favor to political or personal friends of public officials, and at the same time give service as good as could be rendered by private enterprise and at a less cost.

Undoubtedly many evils exist in private operation of public service enterprises. Improper acts should be prohibited by criminal statutes imposing penalties so severe and making punishment so certain that violation would be extremely rare. But prevention of dishonest acts does not require government ownership. Advocates of that policy propose a remedy far worse than the disease. They base their theories upon the false assumption that efficiency goes with public employment. They close their eyes to all dangers arising from the construction of a huge public service machine which could be, and certainly would be, utilized by administrative officials to perpetuate themselves and their friends in control of government, national, state or city.

Most of the dishonest management of public service corporations has been due to the failure of directors to direct. Manipulation of the affairs of a concern for the benefit of a few officers or stockholders has been made possible and encouraged by centralization of control in the hands of one or two men. The dictator has subordinated the interests of all to the interests of a few. Such also has been the world's experience in government.

What we need in this country to-day is a check upon the tendency to centralize power. In private corporations we need directors who will perform their duties even against the desires of a would-be dictator. In government we need legislative officers who have full appreciation of the responsibility resting upon them and who have the courage to perform their duties even in defiance of an arbitrary executive, whether in a mayor's chair, in a governor's mansion or in the White House.

Selfishness and ambition so generally control human action that great delegated power must always be a menace. It is certainly axiomatic that centralized power in an individual or commission can only produce results commensurate with the integrity, ability, experience and unselfishness of the individual or individuals constituting the commission.

Government ownership necessitates government regulation. Failure of government regulation necessitates

the failure of government ownership. Success of government regulation eliminates the necessity or desirability of government ownership.

Because public ownership inevitably increases the political power of the executive, because it tends to overthrow popular or truly representative government, and because it destroys individual initiative, I am opposed to it as a policy to be adopted by either local or national government.

The Larger Aspects of Welfare Work*

Welfare Work in Its Relation to Public Interests as Well as to Employees—Analysis of San Francisco Welfare Platform and the Public Response—Code of Commandments Based on Confidence in Ultimate Fairness of the People

By JESSE W. LILIENTHAL

President United Railroads of San Francisco, San Francisco, Cal.

THE subject of this address may have been meant to have reference to what an employer does for his employees or to what the utility does for the public at large, or both. It will be assumed, however, that welfare work for any is for the welfare of all.

Public welfare is a varying quantity and very often an elusive quantity. For one thing, public welfare may mean what is actually for the public weal or it may mean what the public believes to be for its own welfare. And it may mean one thing at one time and another thing at another time, or one thing in one place and another thing at a different place. So it may be, as it has now become the fashion to proclaim, that what is best for the public is best for the utility. Yet even with this conceded, we shall still find ourselves always brought back to the question of what is really best for the public. It sounds Machiavellian to declare that for all practical purposes that should be assumed to be for the public's greatest good which for the moment it deems to be for its greatest good.

In the man of conscience the feeling is strong that he wishes to guide the people into the right path; that it is not necessary that they must first stumble and fall and bruise themselves before they can find the right path. We are not all agreed as to this, and yet it is a very practical question that those charged with the duty of managing public utilities ought to endeavor to solve correctly, because on its correct solution depends the success of our management and the right standing before the bar of public opinion. We certainly cannot succeed with the public if it has in its mind any question in regard to our absolute good faith, whatever the merit or lack of it, in the things that we offer.

One of the things making up the so-called public welfare program of the United Railroads of San Francisco was the establishment of a monthly magazine,

distributed to each of its 3500 employees, as a means of communication between the men and the company. I contribute in each number a short talk to the men over my signature as president. A little while ago I received a very bright, well-written letter from the wife of a motor-

man, saying, among other things, that she judged from my articles I often felt "lonesome." I have been taking a long time to weigh that statement. I may not yet have caught her meaning. Was it that, notwithstanding the earnest effort made to propitiate the public, it had turned the cold shoulder? And yet we have been doing those things which were intrinsically right under every code of morals and which also appeared to be the things demanded by the existing state of public sentiment.

A brilliant journalist, who had read one of these messages to the men in which I asked why we had apparently not overcome the popular ill-will toward us, recently said that I was striking a false note. I was told that I should not lose sight of the fact that the company, whether willingly or unwillingly, was a prize participant in a rising economic battle, and that armed peace was the best we could hope for. Furthermore, the only way to make popular what was undoubtedly an unpopular corporation was to grant to employees all that they wanted and whenever they wanted it; to do the same thing for the city for the benefit of its competing municipal lines; to surrender to the jitney for love of the little fellow; to extend service whenever asked for; to equip and operate lines regardless of expense and to reduce fares to the Cleveland basis.

I am still smarting under that criticism. This doing your duty by the public costs money, and if it breed resentment rather than good-will, or even if it only fail to eliminate existing ill-will, would not the expense better be withheld? I do not forget the exceptional circumstances under which our particular utility is operating. We have a successful and growing mu-

*Abstract of an address delivered before the San Francisco convention of the American Electric Railway Association on Oct. 5, 1915.

nicipally owned and operated system, all of it competitive to our own, and consequently our company is constantly a thorn in the city's side. The municipal lines pay wages and provide conditions that we cannot afford, and this makes it necessary for us to take the ordinarily indefensible position of preventing, while we can, the organization of our men. This in turn makes us anathema with organized labor and its sympathizers. Then, too, the public accepts it as an undoubted fact that we have secured valuable franchises through the bribery of public officials, and the press does not allow it to forget that the so-called graft prosecution failed to secure more than one conviction.

WELFARE PLATFORM OF COMPANY

I accepted the presidency of the United Railroads of San Francisco only because I thought that I saw an opportunity to render public service. I meant to start right with the public, and to that end began my administration with a formal statement—a sort of confession of faith—in which I acknowledged it to be the primary duty of a public utility to serve the public adequately and considerately. I pledged the company to keep scrupulously out of politics and promised that, if an attempt were ever made to influence public opinion, it would be done openly and in the name of the company. I declared it as my only motive for taking office that I was ambitious to improve the relations between the people and the company and invited the frankest criticism and the most cordial co-operation on the part of the public to that end. Finally, in recognition of the strong sentiment in favor of municipal ownership that had been manifested in a recent election held to provide money for the extension of the city lines, I declared that I had no fault to find with the advocates of municipal ownership even of street car lines, but believed that if such ownership should obtain, the properties themselves could be operated with the greatest good and with the largest profit to the public if intrusted to private management under public regulation.

TREATMENT OF EMPLOYEES

Then, with the desire to treat the employees as generously as the revenues of the company would permit and at least as well as they would be treated by impartial arbitrators (in the case of an organization formed, demands made and refused, and a strike threatened), we voluntarily granted a substantial increase of wages. We devised a plan for insuring the lives of all employees for a period of three years and upward, without any physical examination on behalf of the insurance company and without any cost to the men for premiums or otherwise, the families of the three-year men receiving \$250 in case of death in the service, of the four-year men \$500, and of those having served five years or upward \$1,000. Each employee was allowed to select his own beneficiary arbitrarily. This insurance meant giving to the men something that many of them, quite apart from the expense of insurance, could not give themselves. The man with tuberculosis, with cancer, with Bright's disease or with a weak heart was insured along with those who were organically sound. This was better than a wage increase, for there was no assurance that any of the latter would be husbanded.

Then, realizing as a paramount duty that as far as possible we must stop killing and maiming people and that to accomplish this we must depend on the vigilance, the loyalty and the intelligence of the platform men, we said that, taking the sum paid in the previous year by way of damages for injury to persons or property as a basis, we proposed to give the entire amount that might be saved over this sum in succeeding years to

these platform men in the exact proportion represented by the time contributed to the service.

Finally, it appeared upon investigation that many of our employees had fallen into the hands of loan sharks and were paying as high as 10 per cent a month for loans. Many of these men had the best of records, with excellent characters, but through stress of outside claims, sickness in the family, financial distress and the like, had found their wages inadequate for meeting abnormal conditions and had nothing to take to the pawn-broker or remedial loan association as collateral. We said to such men: "We will lend you the money that you need, without any security, taking from you simply your own promissory notes, payable in such installments as you may yourselves determine to be practicable in view of other demands upon you, and bearing interest at the rate of 5 per cent per annum." Our files are now full of graceful acknowledgments for this aid, testifying eloquently to the good accomplished.

RESPONSE OF THE PUBLIC

When this program was announced we felt that the new management was keeping faith and looked for grateful response on the part of the public. There was a great deal of commendation, to be sure, but I am not certain that the true sentiment of the people at large was not voiced by a prominent and influential local newspaper, which said editorially in double-led type: "The street car workers are men; they are not children to be coddled. President Lilienthal and his directorate should have heard what Lincoln Steffens and Austin Lewis told the New Era Club about welfare work the other day. Welfare work! The United Railroads might as well save its time and money. 'The only way to help labor,' said Lincoln Steffens, 'is to help labor to help itself.'" In other words, employees want nothing from employers that they do not demand and demand in a position where they can enforce their demands.

I have always believed in labor unions. Perhaps I do not believe in them so much as formerly. It is, of course, an indefensible position to maintain that employees shall not be permitted to organize. Even advocates of the open shop stop short of that. Yet in San Francisco we are confronted by a condition and not a theory. Organization of the company's employees would mean inevitably and logically a demand for the same wages, hours and other conditions that are conceded by the municipal lines, under the terms of the city charter, to men working on a track literally alongside of our own. A demand would mean a refusal, because the company cannot concede the demand, and a refusal would mean a strike, which would be a calamity for the company, the public and the men. We have, therefore, been placed in the incongruous position of having to discharge men whose only fault may have consisted of joining the union, because the alternative was inevitable disaster.

It does not seem to be enough to be good 364 days in the year. You must be good the whole 365 days, and to be good you must do the things that the public wants you to do and refrain from doing those things to which it objects. We have tried, in the interest of peace and good feeling, to meet this view, too. At the outset of my administration I said that I would always grant to the city anything that it wished, but that I had no right to forget that, just as officials of the city were trustees of the people, I was a trustee for the creditors and stockholders of the company and therefore must exact a reasonable equivalent for any property rights surrendered. Yet we discovered in a recent experience that we had been sowing the wind.

Such an equivalent for a right proposed to be surrendered was recently asked by the company and promptly conceded by the Board of Supervisors. Their ordinance carrying out the terms of the agreement, however, was vetoed by the Mayor, a majority but not a sufficient number of the supervisors voting to override the veto. The right in question was therefore exercised by the city without giving the equivalent. Upon an appeal to the courts the company's motion for an injunction to restrain the exercise of the right was granted. Unfortunately, however, this has proved to be a case of being good only 364 days in the year, and apparently in consequence of our legal victory the company is once more under the ban of excommunication. The injunction, at this time of writing, is being violated, and boastingly violated, forcing the company to contempt proceedings.

What moral shall we deduce from all this? What is the public welfare? And what should be the course of conduct of a public utility? It is, of course, axiomatic that in things done or omitted the presumption is in favor of a popular public utility, assuming that any such exists, and against the unpopular public utility. When the latter takes a step forward in a matter that should win popular approval, it is likely to be charged with moving from fear and not from public spirit or the desire for public welfare. Yet is that a reason for not making the effort to propitiate the public—shall we refrain from taking this step forward because our motive in so doing may be impugned?

CODE OF COMMANDMENTS

I have laid down for myself the following code of commandments to govern my management:

1. Accept loyally and without reservation the now universally proclaimed doctrine that a public utility is the servant of the people. The courts of last resort have so declared, and the public utilities have bowed their heads in meek submission. Whatever the resources or lack of resources of the utility, adequate service must be rendered. The requisite capital must somehow be provided, the matter of adequate return being irrelevant, except in the sense that the right exists to appeal to the rate-making bodies to provide for reasonable compensation for the service rendered. Do not wait until pressure is brought to compel adequate service. Anticipate the public demand. Keep your door wide open to every complaint. Forestall criticism by inviting recommendations, and in all close cases give the public the benefit of the doubt.

2. Give the affairs of the utility the widest publicity. The public is entitled to know what you are doing and how you are getting on. Conditions may be unfavorable, and you may fear that publicity might affect your credit, but you should not ask for credit that you do not deserve, and perhaps your misfortunes when frankly told may beget the public sympathy and good-will which you so sorely need. Nothing is so engaging as complete candor. When I have been interviewed by the reporter of a newspaper, however unfriendly, I have answered every question directly and fully. As a result it has happened to me at least once that when such candor has not changed the tone of the unfriendly newspaper the reporter has insisted that this attitude be changed or that someone else be assigned to his task. I have gone to men who have assailed me and sought to explain to them my reasons for doing the things that they have criticised. This has sometimes led to a change of front or, as in the case of at least one newspaper editor, to a statement that my position was justified, but that his newspaper to hold its circulation must continue to print the news to please patrons.

3. Treat your employees fairly and, as far as your resources will permit, generously. The man who is well fed and well clothed, who has a reasonable amount of time for play and recreation, who is in a position to save a little for a rainy day or toward the owning of his own home, who feels that his superiors are always ready to receive suggestions or to redress real or imaginary grievances, who is not exposed to nagging and hectoring by officious subaltern officers, who enjoys the right of appeal, who is made to feel that all the employees of the company, from the president down, are members of one family, each having the same paramount duty to serve the public and the employer—such a man will give the best results.

It might be well to have a council, composed of representatives of the men and the chief executive officers of the company, meet once a month to consider measures for the improvement of the service and the increase of efficiency. The representatives of the men should be selected for a certain period by secret ballot—say one from each carhouse. In that way the most popular man would be chosen and through him all the employees of that carhouse would feel that they had a mouthpiece. A new election should perhaps be held every six months or year. This plan will at least furnish a sort of safety valve without providing much of a nucleus, if any, for agitation or organization.

4. Keep out of politics. The public utility is the target for the politician. Those who are not venally dishonest have, at least in recent years, found that attacks made upon it are the short cut to popularity. Those who are venal have found the strike bill the most lucrative source of revenue, and it has seemed necessary to go into politics to keep such men out of office. Where the only purpose of the utility in so doing has been to eliminate such as these, the motive is, of course, ethically justifiable. But all know to what abuses this has led. The utility, to accomplish practical results, has had to build up a political machine. Having through this machine acquired the power to defeat injustice, to stifle bad bills and prevent biased judgments, it is tempted to use this power for affirmative selfish ends and the temptation generally proves irresistible. Then the people, feeling themselves throttled, are driven to rebel and are themselves led into excesses by the desire for revenge. It is from these excesses that we are now suffering.

5. The alternative remedy involves the next commandment—appeal to the public for fairness and justice. Deem it your right and duty to influence public opinion. Complain of the wrongs that are done to you. Expose the methods of corrupt or unfair politicians. Combat the arguments of muckrakers and pseudo-reformers. Never allow an untrue charge to remain unchallenged. Circularize the public. Buy space in the newspapers. Participate in public discussions. Above all, however, remember that whenever you do anything along these lines you must do it openly and in the name of the company. Do not hide behind reading notices. Do not have paid agents masquerading as independent gladiators.

I place my confidence in the ultimate good sense and fairness of the people. Our salvation must be worked out through them, because after all, under our system of government, the power to deal with us rests with them, and we shall not win our battle until we make them feel that we are doing our duty by them. We must be politic enough to recognize our masters and public-spirited enough to be willing to make every effort to deserve the good-will of the people. The task will not be so difficult, if, as we should, we cultivate a frame of mind that makes this a labor of love.

Foundation Principles of Valuation*

Address Based on Electric Railway Resettlement Cases—Author Discusses the Purpose of Valuation, Detailed Methods, Overhead Expenses, Non-Physical Values, Depreciation, Amortization, the Purchase Clause—Social Aspect and Needs of the Industry Are Also Treated

By BION J. ARNOLD

Chairman Board of Supervising Engineers, Chicago Traction, Chicago, Ill.

IT is purposed to circumscribe this discussion and deal largely with the serious condition in many cities where a resettlement or readjustment of franchise rights, privileges and corporate equities is under way, either by sale of the property direct to the city, or better, by giving the city a sufficient interest in its management to insure its understanding of the many and complex problems which are involved.

PURPOSE OF VALUATION

Fundamentally it would seem strange that a given property could have more than one definite value, but a little study will reveal the fact that different viewpoints may require quite different methods of procedure. Thus at the present time valuations are being made with the following purposes in mind: (a) The purchase or transfer of the property; (b) rate-making; (c) capitalization; (d) taxation, and (e) accounting.

The tendency of the later valuations is to cover a much wider scope than formerly, such as the following classification of elements of value:

1. Physical Value—Representing the bare construction cost of the existing tangible property "used and useful" in the operation of the company:

2. Overhead Percentages or Super-Charges—Representing actual expenditures which are incurred in addition to the bare construction cost to obtain the true cost of reproducing new a completely organized and operative property, known as "cost to reproduce new" and for brevity sometimes called "cost new."

3. Development Expense.—Covering all items of cost actually incurred in producing the property over and above those appearing in the existing plant. These may be grouped under:

(a) Semi-Physical or Plant Development Cost—Representing certain charges incurred during the years of development of the property which are not likely to appear in the inventory of the present property.

(b) Non-Physical Values.—Representing the cumulative cost of developing the business.

4. Other Non-Physical Values—Such as remaining franchise value or future earning capacity of the property under the franchise terms, and any other miscellaneous values or rights held. Both purchase value and cost of developing the business are more specific definitions of two of the several elements which are ordinarily included in the omnibus term "going value"† as usually understood.

5. Present Value—Cost new, less depreciation which

has accrued from the time of organization of the property to the date of valuation. This involves a determination of the present condition of the physical property with regard to the remaining life of its various constituent parts.

These various elements are sometimes reduced into two main groups, viz.:

Tangible and intangible values. The commissions usually carry the investigation still further, including all other tangible assets, usually represented on the balance sheet by other assets, bills receivable, and cash or working capital. They also inquire into the history and status of the stocks and bonds and the "book value" or "original cost" or both.

Thus the valuation of a modern property has now reached an exceedingly complex stage, involving not only a detailed historical analysis of the property from the beginning, but also a prediction as to its future possibilities up to the end of its franchise. This in turn requires a very definite knowledge of the past development of the community itself with respect to other communities similarly situated and a fairly accurate estimate of its future growth. Hence in a complete valuation there are many elements of value to be considered, of which the bare construction cost represents only one important element. Which of these elements of value should be given the greatest weight will be determined by the purposes in view.

The frequent misconception of the necessity of separate valuations for different purposes largely arises from the failure to understand the economic relations between the purposes above cited and the various elements of value that should be determined in a complete valuation. With a complete valuation based upon scientific methods of analysis, there necessarily need be no inconsistency in the use of its various component parts for different purposes. Thus, present value plus development charges or franchise values may become the

*Abstract of an address delivered before the San Francisco convention of the American Electric Railway Association on Oct. 7, 1915.

†"Going value" is a term that has been widely used to represent values in excess of the cost new value of the property. It was used for many years to represent the values that were commonly accepted as existing, although the method of determining this value usually consisted in capitalizing the profits from operation. In this case the going value represented that part of the commercial value, on an earning basis, in excess of the physical value or cost new. In later years, when the question of rates based on a fair return on the value of the property was much discussed, it became evident that going value should be defined more clearly, or, better still, be replaced by other well-defined and computable elements of value, which should be based on consideration other than income from rates, themselves in question. This has resulted in the substitution of the values above mentioned and similar elements of value for the more general and indefinite term "going value."

basis for sale or transfer; cost new plus development charges or franchise values for capitalization purposes; cost new for rate making purposes* (except where contractual relations specifically require the recognition of other elements of value), and finally, present value for taxation purposes.

DETAILED METHODS OF APPRAISAL

In connection with the detailed methods of appraisal the following points should be noted:

Verification: In an appraisal the methods, unit prices, quantities and sub-totals at least should be clearly set forth for future verification. Lately there have been several flagrant instances in which the appraisals submitted in very important cases have been so curtailed in statement, either deliberately or otherwise, as to make it practically impossible to check them without further retention of the appraiser and part of his force. This submersion of details may be brought about either through the loading of unit prices with overhead percentages or by the failure to make a complete statement of unit prices and quantities, or both. Any reputable engineer should be willing to have his appraisal analyzed in detail by those competent to do so.

Alternatives: Where questions are encountered which cannot and ought not to be settled by the appraiser, these should be set forth as alternative totals or values. For example, it is often desirable to set out questionable items of joint ownership, plant development—such as change of grade, repaving, reconstruction of bridges, removal of obstructions, etc.—and to compute such elements of value as are dependent upon rate of return upon several different rates.

Construction Schedule: As the cost to reproduce new basis of valuation is generally accepted, at least as a starting point, the property should be assumed to be built up on a definite and reasonable construction schedule. In the case of obsolete property it is often practically impossible to reproduce to-day a property built under a different state of the art, and it therefore becomes necessary to set out as "development expense" the values representing additional inventory or work done in constructing under "original conditions." The total thus represents "full reproduction cost" of existing property covering not only expenditures under present-day conditions but also those in addition thereto necessarily incurred under former conditions.

Unit Prices: Unit prices constitute the most important element of judgment in the appraisal. In general, they are usually taken as of to-day. Yet in cases of commodities of widely fluctuating prices (for example, copper), average prices over a considerable term of years are certainly justified, or else trend prices in the case of price movements clearly in one direction. The real reason for pricing as of to-day is to give the owners of the property, as far as possible, credit for such appreciation in value as has taken place since its organization and to give the prospective purchaser knowledge of the value of the items involved.

Sub-Contractor's Profit: Unit prices are usually made on the basis of a sub-contract for items of purely construction work in which sub-contractor's profit is included; this also in the case of fabricated equipment installed by the manufacturer.

Substitution: Critics of the cost-to-reproduce-new theory point to the inconsistency of valuing property and using prices as of to-day, when these prices are

applied under conditions which governed during the actual construction of the plant. This contention is not serious, for in usual cases the problem of a substitute plant is not being considered—that is, a plant of new and modern design, laid out to accomplish the same work as the old plant. Appraisers must reproduce in kind and under present conditions and take care of any injustice done thereby under development expense.

Land Values: Usually land is appraised on the basis of a willing seller to a willing buyer, as shown by the reported values of transactions in adjacent territory. For street railways this plan would seem to be eminently fair, inasmuch as present-day prices unquestionably reflect appreciation in value. Particularly is this so in the case of right-of-way, which may show an appreciation far in excess of the normal rise in values for corresponding territory unserved.

Appreciation: Basic land values, exclusive of improvements, are now increasing approximately as the 1.7th power of the population of a normal city—in some districts as rapidly as the square of the population. As the same law appears to hold for the normal earning power of property within the last decade, it appears that normal appreciation is going on at about the same rate as the increase in earnings. The fair and proper basis for land values would seem to be to appraise the land for free sale as of to-day, exclusive of all building improvements thereon. In addition thereto damages resulting from the destruction of original buildings may be admissible as development expense unless absorbed by the appreciation on the land.

Right-of-Way: In the case of right-of-way the factor of increase over normal sale value of adjacent land necessary to reproduce prices actually paid by railways for a continuous right-of-way, clearly reflects the result of damages to adjacent property. This factor of increase has been recognized by many commissions as applying to agricultural lands. The same fundamental reasoning applies to private rights-of-way in cities. But it is clear that extraordinary appreciation in land values served by rapid transit lines will in time far outweigh any factor of increase originally considered.

OVERHEAD CHARGES OR CONTINGENT PERCENTAGES

Overhead percentages, dependent upon the character and continuity of construction and methods employed as well as upon the completeness of the appraisal and of the basic records of construction, should be included as part and parcel of the physical value. In general such overhead percentages include the following:

(A)—CONSTRUCTION OVERHEAD

Organization, engineering and incidentals, ranging from 5 per cent to 15 per cent on equipment and construction accounts respectively, are herein included. Organization covers general office expense, securing bids, preparing contracts, purchasing materials, construction salaries, superintendence and legal expenses of construction, etc. Engineering covers the preparation of plans, specifications, contracts, supervision, progress reports, estimates for payment, shop inspection, tests and field engineering. Incidentals cover all construction expense outside of the contract, such as extras due to change in design, interference with work, trial operations, insurance during construction, etc. Real estate usually should carry 5 per cent to cover cost of title, survey of tracts and legal fees. For rolling stock 5 per cent is usually sufficient. Stores, tools, furniture and fixtures, etc., may carry 5 per cent for purchasing, handling and drayage, and possibly an additional percentage

*Later, under amortization, the necessity for ultimately reducing to a present value basis is discussed.

for omissions in case of an approximate checking of the inventory.

(B)—CORPORATE OVERHEAD

Legal expenses, carrying charges, bond discount and brokerage usually total about 10 per cent, applied to all items or to the primary totals. Of this, 5 per cent represents the cost of securing the money. Carrying charges, or interest and taxes during construction, are derived from the prevailing interest rate applied to the actual investment during a definite period of construction, but over only one-half of the period. Bond discount should be considered as legitimate cost incurred in the creation of an operative property.

The foregoing physical or semi-physical items of value are grouped with the items of tangible property and should be considered as such. They should, however, be clearly set forth so that their relative values in the appraisal are easily ascertainable.

General Contractor's Profits: These may or may not be included, depending upon the scope of the primary overhead. The general contractor is supposed to turn over a completely organized, equipped and operating property, without involving extra administrative cost to the owner. This method, however, is not always followed now, and it seems a better plan to cover the necessary items in the construction and corporate overhead percentages, especially where the company has a completely equipped organization, capable of constructing as well as of operating.

Promoter's Profits: Such profits have been definitely excluded on the ground that the company should be compensated in some way for past losses if any were incurred. Yet legitimate costs of promotion are included in the corporate overhead on all properties, and in the case of new properties on which no development expense is computed promoter's profit in some form should be allowed commensurate with the risk involved.

Unprotected Investment: In the absence of a definite contract between the city and the company as to investment, service or return, it has been found necessary to compute the corporate overhead charges on two bases—one assuming the investment protected by such a contract, and the other assuming an unprotected investment. While a total of 10 per cent seemed fair in the first instance, a total of 15 per cent did not seem unreasonable in the second—that is, 8 per cent for bond discount and 7 per cent for carrying charges, etc.* Thus there is a clear distinction between a situation where the company is forced to admit the possibility of partial confiscation at the end of its franchise period, and one where both parties desire to perpetuate the property on a sound and mutually fair financial basis provided for by contract.

NON-PHYSICAL VALUES OR INTANGIBLES

It is a source of gratification that in the later settlements and decisions intangible values are receiving more and more recognition. Of course, everything depends upon the purpose of the valuation and the theory of its application.

(A)—FRANCHISE VALUE OR REMAINING EARNING CAPACITY

When the contractual relationship between the municipality and the company is such that a franchise value is clearly recognized and admitted, the method of ascertaining this is simple. The accounting process is to find the present worth of future net earnings under the

actual franchise conditions, agreements (inter-corporate or otherwise) and ordinances. There is nothing visionary about this value provided two important conditions are fulfilled—namely, that the contractual relations between the city and the company be maintained, and that the company do justice to the public in the matter of service and the preservation of its physical property. The determination of franchise value involves a complete study of the financial, operating and historical development of the property. It may involve a readjustment of accounts to provide for reasonable service, proper maintenance charges (to operating expenses instead of capital account), depreciation caused by age and wear, amortization of non-physical values and possible equalization of franchise grants. It is very likely to involve also a study of the results of unification versus competition or severance of the property into two distinct operating parts, such as urban and interurban (there being kept in view, of course, the possible purchase of the urban lines by the municipality). With the correctness of the accounting as reflected in the operating ratio assured, a determination must then be made of the probable growth of the community and the revenue resulting from its riding habit. Conservatism must be employed in scaling down abnormal rates of growth in population, riding habit and the resulting revenue. The difference between the estimated net income and the amount of interest assumed to be paid, thus represents franchise value.

Allocation of Earnings: The simplest case arises where all franchises expire at the same time, but such a condition is rare. In many cases franchises may run into the dozens and overlap on account of original competitive conditions now removed by consolidation. Owing to the different franchise terms the allocation of earnings over several different parts of the same line or route becomes necessary. This has usually been done by simply distributing the earnings according to the car mileage operated. This method approaches more nearly the theoretically exact method, as the car mileage over the various sections is proportioned to the traffic.

Severance: Here arises the perplexing question where the central part of an extensive district traction system is taken over by the city, the outlying lines being required to stop at the city limits and transfer passengers. Severance and dismemberment cannot result in other than decreased operating efficiency, decreased public convenience and riding habit of the public, increased administration expenses, etc. If this were not the case, the already proved and generally accepted theory of the advantages of unification, both to the public and the company, would fall to the ground. The severance of an outside interurban system, depending largely upon the urban lines for its entrance into the city, seems even more serious than the dismemberment of a local city system, the parts of which are not absolutely codependent.

Rights at Expiration: The Chicago resettlement plan of 1906-1907 presents some interesting phases. Although many of the franchises had admittedly expired, the valuation commission allowed franchise value for eighteen additional months, this being the minimum time which would be required by the city to acquire the property through court proceedings. Note that the commission recognized the absolute necessity for service to the public, or conversely, if the public denied the existence of value until a new system was completed, it should go without service in the interim.

Contractual Rights: The Toronto situation is also of extreme interest, for although the company restricts its operations to the thickly settled district within the old city limits and will not make extensions outside, its right to continue to "skim the cream" is unquestioned.

*For one line the average bond and note discount for recent years was more than 10 per cent. In San Francisco, between 1906 and 1909, the average bond discount for improvements, betterments and extensions was about 20 per cent on a 5 per cent bond interest basis. (The bonds were issued at 4 per cent.) In Chicago, after the rehabilitation, the average bond and note discount was more than 5 per cent, while at the present time in Chicago and Cleveland first mortgage securities approximate par.

At present the company is paying more than 20 per cent of its gross earnings to the city, but when valued in 1913 the earning power under its franchises running until 1921 was found to be more than the value of the physical property then existing.

Service: The right to regulate service directly offsets franchise value and when unreasonably or fully exercised may lead to its entire extinction. It thus follows that the company can expect to substantiate franchise value only when entrenched behind adequate service. Yet what is an adequate service standard? This subject, however, is too complex and far-reaching for more than its bearing on franchise value to be here mentioned.

(B)—DEVELOPMENT EXPENSE

Two significant items of value are here involved: (1) The "plant development expense" incurred in the construction and development of the property existing at the time of the valuation, but for which nothing appears in the inventory; (2) the cost of producing or developing the business as a "going concern." This second item again involves a distinction between the cost of purely commercial development or business organization and the expenditures arising out of property superseded in the past. These development items, therefore, classify themselves into major groups—physical and non-physical—the former pertaining to the property and the latter to the business.

Plant Development: In physical development charges it is not difficult to draw the line between existing property and superseded property. In the Third Avenue Railroad appraisal in New York, these development charges on existing property were separated still further into "operative" and "investment." The former covered preparation for construction, piecemeal construction, repaving over duct lines, etc. The latter covered leased and non-operative property and new construction not yet in commission. Under existing plant development would also come the expense of change of grade and street improvements, the building and rebuilding of bridges, tunnels and viaducts in which no title is allowed to the company, the removal of obstructions preparatory to construction, the excess cost of plant and real estate over that allowed at the time of the appraisal, etc.

Superseded Property: In determining the cost of superseded property everything depends upon the completeness and correctness of the existing records of historical development of plant. In several recent instances it was found possible to go back forty or fifty years and trace the development from horse to cable, from cable to electric, and finally from distributed to centralized power plant operation. A few companies have religiously preserved books and even vouchers, so that the entire plant can virtually be reconstructed from year to year with reasonable accuracy from detailed capital additions and subtractions.

Developing the Business: In determining the commercial development charge or cost of attaching the business, a fundamental assumption must be made—namely, that the company is entitled to a "fair return on the actual investment" honestly and judiciously made, not only at the present time but also during the preceding "lean" years. This assumption forms the basis for accrued deficits or "deferred earnings." It is indeed a hopeful sign that this theory is receiving more and more consideration from regulative authorities. It has been used by the French and Swiss governments in the acquisition of their national railway systems, and also by the Wisconsin and Michigan commissions. In its application the plant is reconstructed year by year, the true operating ratio being adjusted for incorrect

distribution of expenses as between operating and capital accounts, and proper reserves for depreciation and other necessities being included. The balance, or net income, is applied to the actual investment as found. Then the cumulative difference between the fair return assumed and the actual return, compounded, represents the development charge if there is a deficit. Naturally there will be some difference in the final result as superseded property is left in capital account year by year or charged to operation through the depreciation reserve. This is caused by the different compounding effect in the two cases. Where radical changes in the system are involved, such as from cable to electric, it seems more logical to spread the cost over a term of years, while small items can be charged against each year's account.

In this connection a clear distinction between street railways and other utilities should be recognized. Since the cost of developing the business of a street railway is not comparable with that of producing a light, gas or telephone business, going value applies in a far less degree to the railway and may in fact disappear in a system having enjoyed a monopoly from the start. The only item of cost that could then be considered as constituting going value would be the cost of extending non-paying branches into sparsely settled territory under municipal compulsion or for forestalling competition. The resultant operating loss constitutes an element of value, by some termed going value but more properly included as a part of development expense.

Fair Return: The author makes no attempt to specify generally what constitutes a fair rate of return upon which to base this development charge. Unless specifically instructed by a court or commission, or guided by some unusually definite principle or local development, it is usually advisable for one to compute alternative values at 6, 7 or 8 per cent or higher, according to the cost of money during the period and in the locality considered. The most tangible principle that has apparently guided both courts and commissions is that the percentage of "fair" return should increase with the risk involved: i.e., should depend upon the probability of guaranteed revenue, the security of the franchise, the character and powers of public supervision, the character of service demanded, etc. Here again the matter of rates, service and return are completely interwoven. There is one situation, however, in which the foregoing principle must be modified—that is, in the case of a distinctly losing return or a property financed and constructed on too optimistic a plane. Here the owners must be content with a lower rate of return than might be reasonably expected for a property more judiciously built. Hence, the theory of deferred earnings must be based upon a reasonable expectancy of ultimate profitability.

DEPRECIATION

It is a curious commentary upon the rapid progress of utilities that some operators still deny the existence of depreciation and solemnly proclaim their ability to keep a property in a condition 100 per cent good, whatever that may mean. It can be proved that, when a property is old enough so that the cycle of life of its longest-lived depreciable element has expired and a renewal is due, the average "condition" of all the depreciable elements cannot be more than 50 per cent good—i.e., 50 per cent of the service value (plus salvage)—and that a higher percentage would be economically unsound. This does not mean that half of the total investment has disappeared, because some elements, such as land values, do not depreciate. With 85 per cent depreciable and 15 per cent salvage, the 50 per cent theory would result in an economical over-all condition of only 65 per cent.

Renewals an Operating Expense: In obtaining the true operating ratio for computing intangible values, it is essential to include an adequate charge for renewals. It is unfortunate, however, that a distinction is ever made between the maintenance and renewal accounts. Wherever possible there should be a blanket reserve to cover both in order to do away with fine and arbitrary distinctions. Part of such reserve, however, should be represented by actual cash or some negotiable securities. Paper reserves do not buy cars and rails when the time comes for the renewals if the money market is unfavorable. A depreciation or renewal fund is the best guarantee of the permanence of the investment and the good-will of patrons.

Appreciation: It is not well to place any faith in the assumption that appreciation will exactly offset depreciation. In using present land value rather than the value at which the property was acquired, a company receives the benefit of appreciation. Consequently the present value must be obtained to determine the extent of depreciation.

Distinctions: In two recent valuations depreciation was determined by considering the life and the salvage value * * * for all items of property that are normally considered "depreciable," and by using a wearing life for each article based upon the length of time during which it should be able to render efficient service. In some valuations it has been thought desirable to distinguish depreciation caused by one or more of the following: normal wear, obsolescence, inadequacy, age, deferred maintenance and casualties. In most cases, however, these distinctions have not been made, and the tendency of official bodies to do away with the finer distinctions seems to be increasing.

Overhead Charges: Some controversy has arisen as to the propriety of depreciating overhead charges, as well as physical property. For practical reasons these should be depreciated, and the necessity therefor is pointed out under the later heading of "amortization."

Straight-Line-Payment Method: Much confusion seems to have arisen in the terms describing the method of computing depreciation. The practical problem, however, resolves itself into a very simple proposition. Given a cost new and a salvage value at the end of the life (which may either be scrap value or relaying value, in the case of rails), then how much money will be required annually on the average to renew the worn part at the end of its life? This is the simple straight-line or uniform method. The only distinction arising is whether this annuity is to be compounded. For example, the annuity for a twenty-year life would be in the one case 5 per cent flat; in the other case, 3.02 per cent. This method has been erroneously termed the "sinking-fund method," but it is simply the real "straight-line method" of depreciation with annuities compounded on a sinking fund plan. It is general practice to consider the annuity as being set aside at the end of the fiscal year. It is not clear, however, why an amount should not be set aside monthly, as in Cleveland. This would still further reduce the equivalent annuity rate.

All the variations in computing the annuity are caused by the different methods of handling it. A graded rate of compounding might even be devised so as to make it easier on the company now and heavier in the later years. Yet it is a question whether this is sound financing, unless there is assured future protection for the continuing investment by an indeterminate franchise or an adequate purchase clause. Some have suggested a method of depreciating at a fixed rate upon a decreasing principal (present value), but by itself this does not seem to meet conditions at all.

The renewal fund should receive full credit for all salvage value returned from the sale of scrap and all interest on the fund. In this connection it is manifestly unwise for a fund to earn only 2.5 per cent in the bank while it could earn from 5 per cent to 7 per cent in the property. Under proper safeguards as to public supervision of investment, there is no logical reason why the fund should not be thus reinvested for extensions and betterments, thus automatically decapitalizing as much of the property as is constantly disappearing.

Equal Annual Payments: In an exhaustive analysis of this subject of depreciation and valuation, a special committee appointed by the American Society of Civil Engineers came to the conclusion:

1. That rates should be based upon present values—that is, cost to reproduce new less the accrued depreciation.
2. That the equal-annual-payment method of computing depreciation should be used.
3. That depreciation allowances should be credited to the capital accounts from time to time and not distributed as dividends, and that replacements should become charges against capital.

This committee, having apparently accepted the dictum of the courts for present value as the basis of rates, proceeds to apply the straight-line method accordingly and computes depreciation on a decreasing investment value. This, of course, would result in burdening the company during its later years. The net result is, therefore, a composite one, based upon: (a) A decreasing original investment on account of depreciation; (b) an increasing rate of depreciation, as applied, and (c) a fixed return on said decreasing investment. While apparently this method will result in lower rates than that using cost to reproduce new as the basis of rates, this is actually not so. The author prefers the simpler straight-line method in which the annual depreciation is applied uniformly upon the original cost to reproduce new, and not figured as an adjusted rate upon a decreasing investment from year to year.

Until a better understanding is had by the industry in general it is recommended that the straight-line method in its simplest form be studied in connection with the establishment and maintenance of a renewal fund so invested as to earn interest at as high a rate as possible. Unless the fund grows faster than the cost of renewals, the compounding automatically will not ensue and the resultant lower annuity charge for depreciation cannot be utilized.

Amount of Charge: Usually operators look aghast at the proposition of applying from 15 per cent to 20 per cent of the annual gross earnings for upkeep of property, including maintenance and renewals. Formerly 7 per cent to 10 per cent was all that could be spared for upkeep, and occasionally 12 per cent to 14 per cent. From experience with the results of railway operation, however, even 18 per cent to 20 per cent (on a 5-cent fare) may not be found too much.

Basis of Analysis: The use of a certain per cent of gross earnings is simply an empirical method. To arrive at such a percentage scientifically the cost of upkeep should be studied more accurately—that is, on a car-mileage basis for rolling stock; on both a track and a car-mileage basis for track; on a kilowatt-hour basis for power stations; on a car-mileage basis for overhead trolley, and on a life basis for the remaining property. These studies may then be reduced to a fixed percentage of gross earnings for the particular railway. This percentage may not apply to any other line except very approximately, as will be evident in contrasting a short-haul prosperous property like that in Toronto with a

long-haul property which may be just barely able to make a living.

AMORTIZATION

The most significant step taken by the courts and the commissions in recent decisions is the recognition of intangible values under certain restrictions, the clear intent of which is that, if recognized, these intangible values are to be amortized as rapidly as possible* so that the non-physical part of the values thus recognized in a resettlement plan shall be retired within a reasonable period. This is eminently sane and practicable and the only way in which to secure the one desirable result aimed at—that a utility shall be conceived, organized and operated as a perpetual or continuing investment, and at the same time be so managed that the public will ultimately pay such a rate of fare as will result in a fair return on the present value of the property.

The Purchase Clause: The public and the courts have definitely set their faces toward resettlement. Let no more time be spent, therefore, in worrying about whether immediate municipal ownership or ultimate municipal ownership is the thing the people want. Time will decide which one of these planks, if either, is to go into municipal platforms. Companies should cease wasting their energies in opposing a public movement that will surely come in spite of opposition if it is economically sound, and direct their energies toward the terms of the purchase clause and the conditions of a resettlement franchise.

Continuing Investment: First let the tangible part of the agreed valuation stand absolutely as a perpetual and continuing investment, carrying a funded debt which will automatically refund itself under the conditions imposed because the real or tangible property is there upon which to base a new issue of certificates. The property will be there if properly maintained and renewed, and the courts will not permit confiscation. Then retire the intangible values and provide for the accrued depreciation, and the fundamental investment will take care of itself.

Typical Resettlements: It is time to prove to the courts and the commissions that railway investments can be made practically as sound as savings bank investments. Several plans have been worked out, notably those in the Chicago, Kansas City and San Francisco resettlements. They differ somewhat in franchise conditions, but the central idea is to put tangible property behind intangible values, so that if ultimate municipal ownership should prove to be the policy of the country it will come without destroying investment values or curtailing service during the time of its coming. On the other hand, if it does not come the companies will have so managed their properties that the public will have repaid out of earnings every honest dollar invested. And the public in time will eventually receive its service from the companies' hands at a price which will pay a legitimate and agreed return upon the actual physical value of the property then producing the service.

SOCIAL ASPECT

It is necessary only to refer to the financial history of railroad, industrial, light and power, and electric railway properties during recent years to show that some-

thing is radically wrong in the methods of development. While a street railway property is as near a guaranteed monopoly as could be devised, it has apparently fallen behind other utilities in which there is considerably more risk. Under the crucial test of the last year this is particularly true. Thus, in comparing the five months, July to November, inclusive, 1914, with the same months of the previous year, the net earnings of a selected group of utilities and steam railroads show relative growth in the following order: Electric light and power systems, total utilities (including earnings not apportioned), gas companies, steam railroads (decrease) and electric railways (decrease).

The general effect of the war abroad seems to be a decline in the gross and net earnings for all of the utilities. The decline in electric railway net earnings evidently was not caused entirely by the jitney bus and the automobile, for the same characteristic decline occurred in the electric light and power and gas fields. Yet these factors were felt, and while the inroads upon city lines by the irresponsible jitney bus seems to be becoming less dangerous, owing to the adoption of suitable regulations and the realization on the part of the jitney owners as to what cost of service and depreciation mean, the outlook for interurban roads is not so encouraging. This is caused by the constantly increasing number of privately-owned automobiles in the country districts and the rapidly-growing good-roads movement.

FOUNDATION PRINCIPLES—CHARTS SHOWING TWO TYPICAL RATE METHODS FOR CONTINUING PROPERTY

Cost New versus Agreed Value: Probably the majority of railway men will contend that higher fares offer the only solution for the future. The problem must, however, be analyzed further. For the purpose of argument, the accompanying figure contrasts two methods of meeting the tendency of the times toward the rates based on present value, which condition is presumed to be consummated at the end of only one generation:

A. Rates for the present based on reproduction value or cost new, with gradual amortization of the intangible values and shrinkage during the first generation (thirty-three and one-third years).

B. Rates based upon an agreed or resettlement value (including some intangible allowances), with a certain period of rehabilitation during which renewals are added to capital, and with a similar amortization of intangibles.

The first method represents conditions that are desired; the second, conditions that are being forced upon the industry. It can be proved mathematically that, even with completely amortizing within one generation the shrinkage caused by depreciation, the total payment required during the 100-year period shown will be some-

*Such values may be classified generally as follows: (a) Super-seded property or values extinguished through the rapid development of the art; (b) plant development cost incurred on items of existing physical property; (c) general development expense, or amount of deferred earnings accumulated through lean-paying years; (d) franchise value where contractual relations provide for same; (e) corporate overhead as previously defined—including legal expenses, carrying charges, bond discount and brokerage, cost of consolidations and reorganizations, preliminary legal and technical expense prior to actual construction, etc.

what less than if rates are based perpetually on cost new. This assumes a normally operating property, requiring only normal renewals and not rehabilitation. The illustrations, however, both Case A and Case B, start with existing conditions in the railway industry working toward the present value basis, and it appears that during the first generation the average rates in Case A, starting with reproduction value only, will be actually somewhat lower than if based on present value or agreed value plus rehabilitation costs, as in Case B. Yet both rates will be higher than if based perpetually upon the reproduction value only, owing to the amortization assumed.

Sliding Scale: If one could assume a sliding scale of rates which would result in the same average rate required during the next generation, there would be a gradual transition from present-day to future conditions. This is indicated by the sloping rate line in Case A. The rates would necessarily be higher at first. This may be thought impracticable, but consider the converse proposition—that is, percentage return on investment. For in Massachusetts the sliding-scale system of both rates and return has already been put into effect by one of the utility commissions, with results far better than anticipated. In this case (Boston Gas Company), the company deliberately reduced its rates from 90 cents to 80 cents per 1000 cu. ft. in order to earn the higher rate of return allowed by the commission.

The author therefore submits the proposition of a combined sliding-scale method of railway fares and return on investment. Railways have already had experience with the flexible-fare principle in Cleveland, which is a long step in advance, although one is not at all convinced that the American public prefers the kind of service that 3 cents will buy rather than that which 5 cents should buy. But Cleveland did not go far enough. There should be an element designed to encourage the maximum efficiency in operation with a definite reward therefor. Let a combination of the Chicago, Cleveland and Boston methods be worked out, giving both flexibility and reward for efficiency. Obviously, too, adequate service must be an essential factor. The exact basis of rates will not become so important a matter, for in the end the sum total appropriation through a long term of years for return on investment plus amortization will not vary much, whatever the original basis of capitalization. This is the all-important point and the one usually lost sight of, owing to the rapidity of growth of railway properties in this country. Of course, if no amortization is considered, the reproduction or cost new value basis will be easier on the rate payers of this generation, while the present value basis will cost less in the end.

THE NEEDS OF THE ELECTRIC RAILWAY INDUSTRY

The electric railway industry should frankly meet these new conditions by a policy that is founded upon the desire and the necessity of correctly informing the public. It should use the new weapons of publicity, standardized accounting and efficiency methods of management. The preservation of records should be encouraged. Co-operative resettlement plans with equalization of franchise terms, adequate service standards and the protection of the investment should be worked out fairly and sanely. The industry should give its moral support to valuations clearly made in the spirit of fairness to both sides, and not oppose all valuations, fair or unfair, as a sort of trespass upon some imaginary rights, even though established by long practice. Finally, the American Electric Railway Association, representing \$2,500,000,000 of funded debt and the same amount of invested capital and contributing to

the economic and social welfare of perhaps one-half of the population, should take advantage of probably the most important opportunity of its career, and cheerfully and intelligently assist the commissions, the courts and the public gradually to educate themselves to a thorough understanding of the problems of the industry.

SUMMARY

Intangible or non-physical values are receiving more and more recognition, including past losses on a fair actual investment.

Historical development and predictions for the future are becoming essential in the comprehensive study of values.

Detailed inventory is apparently essential to acceptance by courts and commissions.

Every valuation should be so presented as to be readily checked by a competent authority. Submersion of essential details is not in accord with proper procedure.

Definite construction schedules should be assumed in reproducing the property, estimating carrying charges and computing life.

Fluctuating commodity prices should be averaged over a term of years, using trend prices or the weighted average.

Reproduction cost new should consider original as well as present conditions of construction.

Appreciation cannot be held to offset depreciation, as a general principle. It may be computed as well as depreciation if necessary.

Overhead percentages of from 15 per cent to 25 per cent in addition to the bare inventory are to be considered reasonable elements of the cost new of a physical property.

Franchise values can be based only upon definite contractual relations. Adequate service as defined by public rights thereunder is essential to the computation of correct franchise values.

Cost of attaching the business, or going value, can be definitely computed only where accurate records have been preserved.

Renewal funds and amortization of intangible values are a first and prime condition of the permanency of investment.

Depreciation (renewals) is an operating expense to be provided for by a definite monthly reserve or appropriation, compounded.

Renewal funds should be invested and preferably put back into new property, in order to secure the maximum compounding effect.

The simple straight-line method of depreciation, compounded, serves all essential purposes.

Maintenance and renewals appropriations should be consolidated wherever possible.

All resettlements should be made on the basis of a continuing investment, carrying permanent funded debt irrespective of ownership.

Amortization may then be confined to the intangible values, not to the funded property.

A fair rate of return should be dependent upon the risks involved and should increase with the risk.

Valuation and rates form a problem for the second and third generation, not alone the present.

A sliding scale of fares and return best meets conditions of maximum productivity.

Resettlement valuations are of the maximum ultimate importance at present. The industry should support fair methods and not oppose all valuations.

The electric railway industry should meet new conditions with the weapons of publicity, standardized accounting and friendly co-operation with the courts and the commissions.

Electric Railway Accounting Review*

Formation and Early Development of Accountants' Association—Body Has Broadened the View of Electric Railway Accountants and Solved the Many Problems Accompanying the Industry's Growth—The Spirit That Should Rule the Accountants

By P. V. BURINGTON

Secretary The Columbus Railway, Power & Light Company, Columbus, Ohio

ON March 23 and 24, 1897, there was gathered in the Hollenden Hotel, Cleveland, Ohio, through the personal appeal of a few accountants of the principal street railways of the United States, a group of sixteen representatives for the purpose of forming an accountants' association. Such an organization was then formed under the name of the Street Railway Accountants' Association of America as a separate body from the American Street Railway Association. At Philadelphia on Sept. 29, 1905, the association was reorganized under the name of American Street and Interurban Railway Accountants' Association as an affiliated part of the American Street and Interurban Railway Association. At the 1910 convention at Atlantic City the name of the association was changed to correspond with the change of name in the railway association to that of the American Electric Railway Accountants' Association, which is the name now borne.

The first meeting at Cleveland was one of great interest, made so by the fact that electric motive power was so rapidly taking the place of horse and cable power that the old system of accounting was fast becoming obsolete and something had to be done to meet the requirements of the new condition. One of the principal things accomplished was the appointment of a committee on standard classification of accounts. This committee was very active in its work and submitted a tentative classification to the first annual convention at Niagara Falls in October, 1897. With some revision this was adopted at the Boston convention in September, 1898. Owing to its directness and elasticity this classification, with but minor changes, stood the test of ten years' use by the greater part of the street railways of the country until the advent of the interurban railways.

It was then recognized that another new condition must be met and the association proceeded in a thorough manner to solve the problem. The Interstate Commerce Commission and the railroad commissions of various states were now becoming interested in what the railway accountants were doing, and as a result the association was importuned to work with them to the end that a system of accounting might be formulated that would harmonize with the needs of both the railways and the commissions. Through laborious work of the committee of this association an exhaustive classification was adopted and promulgated in 1909 by the Interstate Commerce Commission and the association,

and from that time to the present only a few changes have been made. Railway commissions of many states have adopted the system, the last one being Ohio, as of Jan. 1, 1915.

Aside from this important work the association has been the means of bringing out in accountants the best that is in them by intelligent and wholesome contact; by creating a spirit and enthusiasm which has annually returned them to their duties with higher ideals of responsibility and usefulness; by creating a broader view of things involving both their personal welfare and the welfare of those with whom they are associated in interest, and by opening up to them countless other things of greater value connected with the utilities they represent. Each meeting of the association has been filled with thorough discussion of every subject presented, and it would be difficult to name at this time any one theme relating to the needs of the accountants during these past years that has not been brought to a satisfactory conclusion.

Every member of the association has always been assured of the fact that if he had accounting troubles and perplexities of his own, he would receive the most patient and interested hearing possible at the meetings and, in ninety-nine cases out of a hundred, would obtain a complete solution of his difficulties either at the meetings or through the proper committees or literature of the association. The organization has therefore been worth while and has proved beyond question the wise foresight and earnestness of the few who gathered in Cleveland in March, 1897. In its progress it of course owes much to the loyalty and valuable assistance of the managing heads of the railways, as well as the American Electric Railway Association as a whole.

In connection with this brief review it is proper to consider what this organization stands for under the present day methods of financing and management. Paul R. Jones, secretary Cities Service Company, New York, makes these pertinent remarks in the September number of *Doherty News*:

"When the public utility company was largely a family affair, simple accounting systems and methods were the rule. In recent years certain factors have raised the auditing department of the public utility organization from a purely clerical status to that of one of its most important departments. The need of immense volumes of capital for improvements and extensions in growing communities required a more comprehensive accounting system. The old system of accounting proved unsatisfactory to the financiers and to the bond and stockholders, as well as to the managements of public util-

*Abstract of a paper presented before the San Francisco convention of the American Electric Railway Accountants' Association on Oct. 5, 1915.

ities, and the rule-of-thumb methods were no longer accepted. The need of accurate information regarding the financial and operating conditions of the properties in which money was to be invested became apparent, and the accounting departments were called upon to furnish and devise satisfactory systems of accounting which would give the necessary information to the investors and at the same time assist the management in economical operations."

This statement briefly but distinctly covers the accounting requirements of to-day, and every accountant should not only realize his advanced position but should

imbue himself with the spirit of making good—(1) by knowing the things required of him; (2) by setting about to do them; (3) by taking the initiative when he sees that ideas and facts he may possess would be valuable to his company, for under the business methods of to-day the thirst of aggressive managers is for the best there is, and (4) by maintaining unquestioned loyalty to his company, as in no other way can he merit a return of loyalty. This spirit has been the ruling incentive in all of the work of the association, and who shall say that its members are not making good after this struggle of eighteen years?

Prepayment Cars and the Accountant*

Non-Statistical Review of Prepayment Idea in Relation to Development of Car Construction, but Particularly in Relation to Devices for Collecting Fares—Fare Boxes Analyzed and Compared—Old Accounting Reports Too Often Still Prepared

By R. J. CLARK

Comptroller Metropolitan Street Railway, Kansas City, Mo.

IN general, prepayment cars have demonstrated their ability—all other things being equal—to increase earnings, reduce expenses, decrease accidents and provide an outlet for inventive genius that has in some cases deferred charges to obsolescence and in all cases resulted in the position of the company being improved with the traveling public. Yet if managers and accountants generally have been interested in the wonderful ingenuity and variety of the new types of car construction, what can be said of the equally great development made in collecting and accounting for fares. It is but natural that the accountant should become as much interested in the wealth and variety of fare devices as he is, or has been, in the development in car construction and reconstruction with the attendant effect on capital, income and expense accounts.

The first prepayment car was ordered by an American company in 1907, the chief idea, or the one receiving the greatest attention, being that of having the fare registered instead of accounted for by the employee. Since then it has been interesting each year to watch the development of the money-counting fare box and see how the inventors strive not only to overcome the mechanical difficulty of counting coins accurately according to value with the small differences in diameter between some of them, but also to overcome service and climatic conditions and the untiring efforts of dishonest conductors. These developments have continued until last year there were exhibited electrically-operated recording fare boxes, and no doubt at this convention recording fare boxes capable of receiving and recording not only coins but ticket fares are exhibited.

It is possible that the installation of fare boxes may overcome an objection sometimes heard that prepayment cars in spite of their separate and enlarged exits and entrances slow down the schedules and thus more than offset the saving effected by redeeming lost and overlooked fares, because the passengers having the exact fare ready may board and deposit it and pass on into the car without waiting for those needing change, as is now necessary where fare boxes are not employed.

The principle of fare-box collection is to relieve the

conductor of all inconvenience and responsibility of handling cash and incidentally to remove any temptations from handling it, to prevent substitution of fares, and finally to insure the company against carelessness or negligence on the part of even honest conductors whereby fares are lost through failure and oversight to ring them up. The development of this principle has resulted in two well-known types of fare boxes being placed on the market—the locked box and the non-locked recording fare box. The former receives and retains every fare deposited, and the conductor is supplied with change by satisfactory and inexpensive methods. The non-locked box records the fare, and the money is afterward released to the conductor for the purpose of making change. It is certain that with the prepayment type of car a fare box is essential or at least advisable.

There are two types of locked box, portable and stationary. The principle is exactly the same, i.e., the reception and secure retention of all money collected. The portable boxes cost about \$10 each, but on account of having to provide a box for each conductor instead of a box for each car—as in the case of the stationary locked box and the non-locked recording box—about twice as many portable boxes are required as stationary boxes. In the case of the Metropolitan Street Railway, three times as many would be required on account of having to account for earnings between states.

The great advantage (exclusive of original cost and maintenance) of the portable fare box is that it can be removed from the stand on which it ordinarily rests on the prepayment car and at rush-hour periods be passed by the conductor to those passengers who cannot get near enough to the stationary locked or non-locked recording box to deposit their fares. Moreover, it can be used on cars not yet converted to the pay-as-you-enter type. From many years' experience the writer knows that their cost of up-keep is very small and the cost of operating, i.e., distributing, collecting and counting contents and keeping conductors supplied with change, would not be much more expensive than the present method. The lower original cost and lower maintenance charges of this type of box recommend it, and in addition it has not the intricate mechanism to get out of order or to be tampered with or manipulated by the dishonest conductor, that recording fare boxes have.

*Abstract of a paper presented before the San Francisco convention of the American Electric Railway Accountants' Association on Oct. 5, 1915.

The comparative advantages and disadvantages of the different types of fare boxes may be briefly summarized as follows:

NON-LOCKED RECORDING BOXES

Disadvantages or defects as compared with

(a) *Register System*

1. As these boxes are stationary it is possible to use them only on the prepayment type of car, and only about 60 per cent are of that type.

(b) *Locked Box (Portable)*

1. Johnson, Dayton and International, with the fare register each recommends, would mean high installation costs and correspondingly high maintenance expense.

2. On account of the stationary feature it is not always possible for passengers to get near enough to deposit their fares.

3. Their adoption would perpetuate the present cumbersome system of handling cash, and it would be counted six times where it is now counted five and where it should be necessary to count it only once.

Advantages as compared with

(a) *Register System*

1. They embody the principle of fare-box collection—that is, they insure the company against carelessness and negligence, even on the part of honest conductors, whereby fares are lost through failure or oversight to ring them up, and they prevent the substitution of one class of fare for another by dishonest conductors.

(b) *Locked Boxes*

1. The coin, having passed through the machine, registers its value and is immediately available for change-making purposes.

LOCKED BOXES

Disadvantages or defects as compared with

(a) *Register System*

1. It is asserted that their operation would necessitate a system of collecting or distributing the boxes, counting the contents and providing the conductors with change. This objection is greatly exaggerated and is possibly caused by inexperience and the fear that naturally arises when a change is first contemplated.

2. It has been asserted that the company loses because slugs, mutilated coins and counterfeit coins are deposited as fares. This is not so serious a loss as might at first be expected. American silver is not mutilated to the extent that Canadian silver is, and yet the losses in Toronto were comparatively insignificant. As regards slugs, conductors are usually human enough to dislike having anything "put over" on them, and they watch very carefully the fares deposited and never hesitate to call the passenger's attention to an improper coin.

3. It has been stated that because no register readings accompany the fares deposited in the locked boxes, petty stealing is made possible in the treasurer's office. It is always difficult to eliminate this type of dishonesty, but during the writer's seventeen years' association with the Toronto Railway this happened only once. With a proper system installed this sort of petty thievery is practically impossible.

4. It has also been stated that there is the possibility of the box and contents being stolen, but this is not likely to happen any more frequently than hold-ups occur at the present time.

5. Another argument against the portable box is that the conductor may substitute a box for the company's regular box. This is a remote possibility, but such an occurrence has never been heard of.

[Note: The only serious objection in the writer's opinion to this type of box is the fact that as it becomes filled with nickels it may become heavy enough to cause the conductor inconvenience in operating on cars not converted to the pay-as-you-enter type.]

LOCKED BOXES

Advantages as compared with

(a) *Register System*

1. They relieve the conductor of all inconvenience and responsibility in handling cash, and incidentally remove any temptation that might arise from such a source. Moreover, they prevent the substitution of one class of fare for another and insure the company against carelessness and negligence even on the part of honest conductors, whereby fares are lost through failure or oversight to ring them up.

2. Cash is handled and counted only once and not five times, as now occurs.

(b) *Other Boxes*

1. While recording boxes prevent the substitution of fares and insure the company against carelessness, they do not relieve the conductor of the inconvenience and responsibility of handling cash or remove the temptation that arises from this to the extent that locked boxes do.

2. The locked boxes offer absolute security.

3. The locked boxes also have greater efficiency in that they can be used as stationary or portable boxes.

4. Their low installation and maintenance cost has already been mentioned.

5. The portable locked boxes can be used on any type of car without waiting for it to be converted to the pay-as-you-enter type. (The stationary locked box is limited in use to prepayment cars.)

6. They can be used on a route where two collections are made on each half trip.

7. Cash is handled and counted only once and not six times, as would be the case with the recording boxes.

8. In the early stages it was possible to "pick" the locks, but assurance is now given that the locks have been so improved that this is no longer the case.

Inventors and manufacturers have improved upon the register until they have exhibited registers which not only record the cash and different ticket fares on each trip but total same, print in the time, car number and conductor's number. It would appear that the time is approaching when the progressive accountant can fulfill his long, long wish to procure an earnings sheet on which neither pen nor pencil is required by the conductor or in the auditor's office. Possibly these things would have come without prepayment, but they did not, so that prepayment must be credited with instituting progressiveness in fare receiving and recording devices.

In the future, too, the prepayment car may be responsible for a transfer-issuing machine. The writer hopes that some one will invent a machine whereby without increasing the burden of the conductor he can record the number of passengers boarding and alighting from his car at different points along the route. Such a machine would be of incalculable value to the transportation department in regulating service.

All the past developments brought problems to the accountant. When he had only to accept the driver's turn-in and later merely count and record the contents of the receptacle, things were easy. But difficulties increased when he had to compare the conductor's turn-in with the register readings, and many and extensive checking systems were developed. Too often, however, in addition to making the new reports and meeting the new methods of accounting made necessary by the adoption of prepayment cars with fare boxes or improved recording registers, he has had to prepare statements and reports along lines laid down before the invention of these devices. The ordinary accountant revels in statistics and reports, but he delights to have his reports used. One of this year's committees has referred to the time and effort spent each day in preparing reports of daily earnings by routes, by car-hour, by car-mile, etc., although the accountant and the management know that these reports do not show traffic conditions.

Development of the Electric Railway*

Electric Railway History Divides Itself into Definite Characteristic Periods—The Development Has Been Accompanied by Marvelous Technical Progress—The Public Service Character of Electric Railways Is Coming to Be More and More Generally Understood

By JAMES H. MCGRAW

President McGraw Publishing Company, Inc., New York

A TREMENDOUS industry has been created in about thirty-five years. Its inception was largely due to American genius, and its early development to American courage and capital. It has kept pace with the best in American industrial life and has gone hand in hand with other important developments that have made this country the leader of the world in material prosperity and those things that make for the convenience and comfort of its people.

The magnitude of this great industry is indicated by the present capitalization of more than \$4,500,000,000, exclusive of the large amount of capital invested in the immense industries required to supply these railway companies with apparatus in the way of cars, electrical equipment, generating apparatus and rails. But it is not alone in the increase in passengers carried by these railways, from 2,023,010,292 in 1890 to more than 12,000,000,000 in 1912, that the importance of the electric railway as a factor in the comfort, health and prosperity of the citizens of this country can be measured. The new means of transportation thus created gave a quicker and more comfortable way of traveling from home to place of business, from city to country and between adjoining cities.

The history of the development of the electric railway divides itself naturally into three periods which appear in the history of all great developments. First there is a period of preparation in which mystery veils important physical and economic facts and laws, but hardy and curious pioneers gradually bring these facts and laws to light. Then comes a time when invention crowds invention as the accumulated knowledge demands application and, in fact, we may call this the period of application. And finally there comes the period of adjustment as the world learns to use effectively the new tools placed in its hands.

PERIOD OF PREPARATION

In the period of preparation I shall pause only long enough to pay my tribute to those now nearly forgotten

*An address delivered before the annual convention of the American Electric Railway Association in San Francisco, on Oct. 8, 1915, on the occasion of the presentation of a testimonial from the Panama-Pacific Exposition Company to the associations commemorative of the 1915 meeting.

[NOTE—In opening his address, the speaker referred first to the important influence exercised on the industry by the American Electric Railway Association and the allied Manufacturers' Association. He then gave a short account of the first meeting of the Railway Association held in Boston in 1882, at which no papers were read, following this by stating some titles of papers presented at early meetings. He also mentioned the organization of the American Electric Railway Manufacturers' Association at Saratoga in 1903. He then continued in part as above.—Eds.]

pioneers whose scientific curiosity lead eventually and naturally to important inventions. Hardly had Faraday and Henry discovered the laws of the electromagnet and the principles underlying the electric motor before attempts were made to apply the new motive power to transportation. Davidson, Davenport, Farmer,

Page and others constructed operative electric cars but were handicapped by the limited supply of electric power available, the only source in their day being the primary battery. Professor Page, under the patronage of our government, constructed a high-speed electric locomotive in 1857 and demonstrated the possibility of electric traction. The commercial future of the electric railway, however, was determined by the invention of the dynamo when the nineteenth century was about two-thirds passed, and then practical inventors hastened to apply the crude experience of the earlier pioneers.

PERIOD OF APPLICATION

Most of my hearers will remember that about 1888 Frank J. Sprague had just completed the installation of an electric railway at Richmond, Va., the largest of the kind by far in the country. His principal competitors were Stephen D. Field, formerly a resident of this city, Charles J. Van Depoele, the brilliant Belgian whose early death was a great loss to the industry, Leo Daft, still living, Sidney H. Short, who was later to play an important part in the electrification of the tramways in Great Britain, and H. H. Bentley and Walter H. Knight, who together built the first underground electric conduit railway in the country, on Euclid Avenue in Cleveland. The work of these men marked the beginning of the period of application.

The statistics of 1890 show a total length of electric railway track of 8123 miles, of which 1262 miles, or 15 per cent, had been equipped for electric operation and 488 miles with cable, while on 5661 miles animal power was still used and steam power was employed on 711 miles. Some 2,000,000,000 passengers were being transported every year and the gross income from all sources was a little more than \$91,000,000 annually.

The next twelve years were characterized by expansion and great hopes. During this time most of the city railways in the country were changed over to electric operation and many lines were projected into the suburbs, although the development of the system of polyphase transmission at high tension with converter substations had not proceeded far enough at that time to make the modern interurban railway possible. The total number of miles of track of street railways in-

creased from 8123 to 22,577, or an increase of 178 per cent. Of these 22,577 miles, 21,908 miles were equipped with electricity, leaving only 259 miles operated by animal power, 241 miles by cable power and 169 miles by steam power. During this period also the number of passengers paying fare had much more than doubled, increasing from 2,023,010,202 to 4,774,211,904. At its end there were 140,769 electric railway employees drawing annually \$88,210,165 in salaries and wages.

PERIOD OF ADJUSTMENT

The satisfactory development of electric railway traffic along well established lines is indicated by the increase in the number of fare-paying passengers to 7,441,144,508 by 1907, a 56 per cent increase, with a nearly proportionate track mileage increase from 22,577 to 34,403, or 52 per cent. There were 221,429 employees who received annually \$150,991,099. But the corporate organizations inherited from the horse-car days were found to be as crude and to grow obsolete almost as rapidly as the apparatus used during those times. It soon became evident that the small property was much more expensive to operate proportionately than the larger one, and consolidation became the order of the day. In fact, the half decade from 1902 to 1907 might be called the period of consolidation, and in the latter year the existence of more than one electric railway company in any city was exceptional.

Then came a period of regulation which might be termed the characteristic of the next half decade, from 1907 to 1912. Up to ten years ago railway companies, both steam and electric, had been considered by the public as well as their owners more in the light of private enterprises than of public utilities. But a change had to come. The growth of the railways had made the public more dependent upon them and led to a perfectly legitimate demand that the public should have something to say as to the operation of these lines and at the same time should throw its protection about them by preventing them from becoming the victims of destructive competition. Publicity of accounts was also required. For many years previous a few states had had boards of regulatory commissions known usually as railroad commissions. In most states, however, the power of this board was enlarged or a new board was established under the title of Public Service Commission, and the responsibility of the company to the public as well as the public to the company was more generally recognized.

As I intimated at the outset, we are now in a period of adjustment. The importance of the modern railways to civic development has been demonstrated. The electric railway is one of the most important factors in the growth and prosperity of any city. It has become so necessary to the life of the ordinary person that, while in 1890 the average number of times which every person in the entire country paid fare on the street cars each year was only thirty-two, but this figure rose to sixty-one in 1902, to eighty-seven in 1907 and to 100 in 1912. To render this service required 282,461 employees who were paid \$200,890,939 annually.

An important element of the progress described has been in the coincident technical development. In the generation of power, for instance, the sizes of the units are constantly on the increase, and whereas a decade ago 5000 kw. was about the maximum for a single machine, the builders of turbine generators are now producing units of six or seven times that size. Improvements in the art of insulation manufacture and of high-tension transmission-line construction have proceeded at equal pace. Voltages of from 10,000 to 15,000 were regarded as high not very long ago, but to-day plants are being designed for voltages of 100,000 or

more. Similarly inventive genius has been at work in improving the methods for transforming this high-tension energy to lower voltages for distribution purposes.

In my belief, we are passing now only across the threshold of an enormous development in the application of electricity to the transportation problems on the continent. Indeed, the wide diversity of the possibilities in its use under heavy electric traction conditions has received a very practical illustration during the past year, through the opening of the new lines of the Norfolk & Western Railway and of the Pennsylvania Railroad in and near Philadelphia, and the adoption of the same motive power for one of the links in the trans-continental line of the Chicago, Milwaukee & St. Paul Railroad.

It would not be fitting for me to close this review without a reference to the growth of the idea of the public service character of electric railways as well as other utilities. Their primary obligation is now recognized to be that of giving good service, and this idea is the foundation of the code of principles which was adopted by the American Electric Railway Association as a guide to its members just one year ago. The railway is the servant of the public, but the public must not forget that the servant is worthy of his hire. The railways sell transportation but they give service, by which I mean those benefits which come with good transportation. For example, the agency which permits the city toiler to live in the country, which raises the value of real estate, which reduces physical fatigue and which conserves the worker's time is giving service.

And there is need for more service which will be furnished if capital can be attracted to the railway business. The population of this country is growing rapidly, but it is a well-known fact that the needs for transportation in any community increase in even a greater ratio than the population. Nevertheless, the agencies to supply this need are lagging behind. Unless capital can be assured of a fair return on a fair investment in these properties, it will go to other fields. Vast as are the figures of the traffic done by the electric railway companies of the country, but few cities are yet adequately supplied. The possibilities in the way of a light package express and freight service within the boundaries of the urban community and between city and country have hardly been touched. A few trunk lines have installed electric locomotives, but many more would find it advantageous to do so.

The foundation of the civilization of the Roman Empire lay in the magnificent roads which it built connecting its provinces and main cities. Wherever Roman influences went the roads followed, making access easy from one part to another and carrying not only the soldiers of Rome, but its greater armies of peace and commerce. With the boundless possibilities of this country in the way of progress and undeveloped lands improvements in this modern means of communication between the city and country and between different parts of a city should be encouraged. With the close of the present terrible war in Europe this country is bound to receive, in my opinion, the largest flood of immigrants which it has ever experienced. From the desolated fields of Europe and from its grinding burden of taxes man will come to this land of ours where those of different nationalities and different tongues live in amity together. We must provide for better means of communication and transportation than are now possessed so that our transportation facilities will keep pace with the needs of the increasing population. If this is done I believe that we may look forward to the years following the close of the war as the most prosperous which our country has ever known.

The American Association Convention

The Delivery of Two Striking Addresses, the Reduction in Section Members' Dues, the Proposal to Enlarge the Allied Family, the Presentation of Reports on Cost of Passenger Transportation Service and Taxation Matters Were Notable Features

Tuesday Morning Session

PRESIDENT C. LOOMIS ALLEN opened the thirty-fourth annual convention of the American Electric Railway Association on Tuesday, Oct. 5, 1915, and introduced as the representative of Hon. Hiram W. Johnson, Governor of California, Hon. Chester H. Rowell, editor of the *Fresno Republican*, who delivered the address of welcome. He referred to the invention of cable cars used for climbing San Francisco hills as the first mechanical street transportation. Dwelling upon the subsequent sociological development, he said that modern city transportation has meant the growth of cities, the breaking up of slums and has made possible the industrialization of modern life. Modern sanitation and modern transportation, which make it possible to concentrate work and distribute residences, are the two things that make the modern city possible. They have a social value beyond estimate.

President Allen then read his annual address which is abstracted elsewhere in this issue. On motion of C. L. Henry, Indianapolis & Cincinnati Traction Company, the reading of the executive committee report was dispensed with and Secretary-Treasurer E. B. Burritt read a recapitulation of his report, which was accepted. Mr. Burritt first outlined briefly the status of the association in regard to membership and finance, and told something of the routine work of his office. He also gave the usual data, summaries of which appear in the accompanying table. He stated that comparatively few resignations had been received as a result of the increase in dues. Also fifteen new company members and 626 new individual members had been received during the year, the total of company section members now being 853.

The principal activity, in point of time, of the bureau of fare research has been the making of a number of special studies concerning the various phases of the cost of passenger transportation service. The collection of financial and statistical data and of information

CONDENSED FINANCIAL STATEMENT

Cash on hand, Oct. 1, 1914.....	\$5,175.80
Receipts, year ending Sept. 30, 1915.....	87,164.67
Total cash	\$92,340.47
Expenditures during year ended Sept. 30, 1915.....	81,675.69
Balance in bank, Sept. 30, 1915.....	\$10,664.78
Bills receivable Sept. 30, 1915.....	8,209.68
Total	\$18,874.46
Bills payable, Sept. 30, 1915.....	9,388.71
Balance as of Sept. 30, 1915.....	\$9,485.75

MEMBERSHIP STATISTICS TO SEPT. 30, 1915

	This Year	Last Year
Company members enrolled.....	364	379
Number which have paid dues.....	343	361
Individual members enrolled.....	3,012	2,884
Number who have paid dues.....	2,787	2,762
New company members	16	23
New individual members.....	630	900

concerning the progress of various rate cases has been continued and information has been furnished to a number of member companies and to association committees. The information collected is an integral part of the association files.

The information bureau received 377 requests for information from 184 companies, in complying with which a number of special investigations were necessary. The bureau has followed closely the spread of the jitney movement and has endeavored to keep its files up to date on all phases of this problem. It has on file practically all ordinances enacted so far and in addition a number of legal decisions relating thereto as well as the rules formulated by a number of public service commissions.

On account of the fact that the space occupied by the association at the United Engineering Societies Building was not adapted to the requirements of the office force, after a thorough investigation by a special committee the new quarters at 8 West Fortieth Street, New York, were secured. As a result the association has an efficient working layout at a saving of something over \$1,200 annually in rent.

Program for Tuesday

ADDRESS OF WELCOME—
Annual Address of the President.
Annual Report of Executive Committee.
Annual Report of Secretary-Treasurer.
Reports of Committees:
Subjects—C. L. Henry, chairman.
Education—H. H. Norris, chairman.
Representing Association at the American Good Roads Congress—E. C. Faber, chairman.
Valuation—L. S. Storrs, chairman.
National Joint Committee on Overhead and Underground Line Construction—W. J. Harvie, delegate.
ADDRESS—"Welfare Work," Jesse W. Lillenthal.
Reports of Committees (Continued):
Company Membership—James E. Gibson, chairman.
Company Section Medal—S. G. McMeen, chairman.
Federal Relations—Arthur W. Brady, chairman.
Anthony N. Brady Medal—A. W. Brady, chairman.
Compensation for Carrying United States Mail—Capt. A. R. Piper, chairman.

Program for Wednesday

Reports of Committees:
Electrolysis—Calvert Townley, chairman.
Ways and Means—J. H. Pardee, chairman.
Company Sections and Individual Membership — Martin Schreiber, chairman.
Dues of Company Section Members—J. D. Mortimer, chairman.
Changes in Constitution and By-Laws—R. I. Todd, chairman.
Relations with State and Sectional Associations—R. P. Stevens, chairman.
Public Relations—Thomas N. McCarter, chairman.
ADDRESS—"Evils of Government Ownership," Hon. Jonathan Bourne, Jr.
Reports of Committees (Continued):
Operation of Motor Vehicles—B. I. Budd, chairman.
AERA Advisory — H. C. Donecker, chairman.
Insurance—H. J. Davies, chairman.
Standards for Car Loading—S. W. Huff, chairman.

Program for Thursday

Reports of Committees:
(a) Cost of Passenger Transportation Service—including Report of Bureau of Fare Research—J. D. Mortimer, chairman.
ADDRESS—"The Foundation Principles of the Valuation of Electric Railways," Bion J. Arnold.
General Discussion.
Reports of Committees (Continued):
Taxation Matters—T. W. Wilson, chairman.
On Recommendations contained in President's Address.
Resolutions.
Nominations.
Unfinished Business.
Election and Installation of Officers.

Program for Friday

Presentation of bronze plaque by C. C. Moore, president Panama-Pacific International Exposition, to C. Loomis Allen, president American Electric Railway Association, followed by an address on "The Development of the Electric Railway," by James H. McGraw.

Sixty-seven committees appointed by the five associations have held seventy meetings during the year. During the year eighty companies sent in 17,227 reports to the Hooper-Holmes Information Bureau and the bureau returned reports on 2135 names.

After the acceptance of the report President Allen announced as members of the convention committee on resolutions C. S. Sergeant, Boston Elevated Railway; J. J. Stanley, Cleveland Railway, and Jesse W. Lilienthal, United Railroads of San Francisco.

On motion of Mr. Henry, naming the following committee on recommendations contained in the president's address, the convention confirmed the nomination of A. W. Brady, Union Traction Company of Indiana; T. N. McCarter, Public Service Railway; E. W. Rice, General Electric Company; Guy E. Tripp, Westinghouse Electric & Manufacturing Company, and Gen. George H. Harries, Omaha Electric & Power Company.

C. L. Henry then read the report of the committee on subjects, including the mid-winter meeting program, which the committee had arranged, and stating that the San Francisco program had been prepared after several meetings. The report was signed by the chairman and M. C. Brush, H. C. Clark, L. P. Crecelius, R. E. Danforth, C. S. Mitchell and William Tichenor.

In the absence of chairman H. H. Norris, *ELECTRIC RAILWAY JOURNAL*, President Allen commended to the attention of members the printed report of the committee on education. In its report the committee explained that the courses for shop, power-house, line and track men, approved last year by the association, had been inaugurated, and that on July 1, 1915, the following number of students were engaged in the courses mentioned: Electrical shop courses, thirty; mechanical shop course, six; combined mechanical and electrical course, twelve; line and track-work course, six; power-house and substation course, forty-one, and combined line and track-work, and power-house and substation course, four. Employees of forty-four electric railway companies are represented in the enrollment. The committee pointed out the limitations of correspondence construction, warning students against expecting too much from it, but pointing out how gratifying results can be achieved.

The report was signed by H. H. Norris, chairman; H. A. Bullock, Martin Schreiber, W. L. Robb, A. M. Buck and V. Karapetoff.

The report of the committee representing the association at the American good roads congress was not read at the appointed place on the program but an abstract will be found later in this report.

VALUATION

The report of the committee on valuation was read by C. S. Sergeant. In the report the committee recognized the general dissatisfaction with the existing methods of valuing public utilities, the diversity of opinion among public service commissions and the lack of consistency in the decisions of state and federal courts. To establish a set of sound and defensible principles out of this mass of conflicting opinions will require a vast amount of painstaking labor in the accumulation and critical examination of the material for the purpose of determining whether principles can be evolved which have not heretofore governed the consideration of this question. This will require the work of a specialist and necessarily a fund to carry on such work. It would be advisable to have the report of the specialist critically examined, not only by the members of the committee, but by the representatives of utilities not represented on the committee, in order that all viewpoints may be considered. The committee recommends a preliminary appropriation of \$500 to create a

fund for starting the work. Outside contributions could be obtained for carrying the work to a conclusion.

The committee has made arrangements for the publication of a complete and up-to-date bibliography on the subject of valuations for distribution to member companies, the funds for such work having been appropriated by the executive committee at its last meeting.

The committee's report was signed by L. S. Storrs, chairman; H. H. Crowell, Gerhard Dahl, C. S. Sargent, W. H. Sawyer, J. N. Shannahan, Martin Schreiber, B. E. Tilton and C. G. Young.

Secretary Burritt next read the report of the national joint committee on overhead and underground line construction, which is abstracted briefly below:

As the accredited representative of the American Association on the national joint committee on overhead and underground line construction, W. J. Harvie reported that eight meetings had been held and that the following standing sub-committees had been appointed: On underground and undergrade crossings; on electric wires over electric railway tracks; on trolley contact wire crossings; on structural works; on insulation; on conductors, and on clearances. The meetings have been largely attended and, as the committee is large, a committee on plan and scope was appointed to direct and co-ordinate the work of the sub-committees. The sub-committees are now actively engaged in a study of the newly-suggested specifications for wire crossings for public utilities, produced by a committee representing the different classes of utilities in interests of the State of Pennsylvania, and recommended to the Public Service Commission of that State by that committee for adoption.

Jesse W. Lilienthal, whose address on welfare work was the notable feature of the day, was then introduced by President Allen. An abstract of this address appears earlier in this issue. As his address closed, Mr. Lilienthal was greeted with an outburst of the warmest applause, which was continued until he was obliged to rise in acknowledgment. President Allen then called upon James H. McGraw, *ELECTRIC RAILWAY JOURNAL*, to lead the discussion.

Mr. McGraw who, like the others present, had not had an opportunity to read the paper in advance and had not expected to be called upon to discuss it, said that no offhand statement could give adequate expression to what he felt regarding the paper read by Mr. Lilienthal. It was not a mere statement of welfare work, not a mere statement of personal experience covering two years as president of this great property. The address, said Mr. McGraw, points the way, it goes to the heart of the greatest problems confronting the electric railways. Their problems to-day are serious and many, from many angles more serious than ever before. It has been said that no public utility can permanently succeed so long as it has the public sentiment of its community against it. Mr. McGraw dwelt upon Mr. Lilienthal's code advising the telling of the whole story honestly and fairly. The electric railway properties, he said, should and must be saved. They can only be saved through the proper winning of public support. He believes, as all do who have given this subject of public relations some thought, that public approval can be won. He predicts that the method adopted by Mr. Lilienthal in San Francisco will win out so that public sentiment in the city, which has been so bitter and so hostile toward the electric railway corporation, will come around and the public will thank it for what it has been doing and the way in which it has been doing it.

Gen. George H. Harries was next called upon to discuss the paper and said there was no question as to the accuracy of reasoning set forth with uncommon clear-

ness and a frankness for which all should be grateful. Thanks to the continued preaching of a few faithful apostles, the policy of open and frank discussion has been welcomed in the association meetings, as an example of the possibility of winning public approval to this policy of actively seeking to educate the public to a knowledge of the companies' position. He cited a personal experience with a property which had been managed in the old-fashioned way, quoting the proverb of the British army to the effect that an Afghan properly attacked is less formidable than an Afghan attacking and said, there is nothing in being afraid of your community.

He had taken the sting out of an editorial accusing the company of being in politics by printing a vigorous statement of its impartiality and lack of interest in politics, in paid advertisements in all the newspapers, including the one running the editorial. The Businessmen's Association is now conducting, through a committee with the assistance of expert investigators, a study to determine the cash cost of the property from the beginning and will next consider with expert assistance the question of a fair return on the investment. General Harries said that this property will ultimately have peace and a square deal. Absolute honesty and frankness based on a desire to serve will win.

Chairman James E. Gibson presented the report of the committee on company membership. In its statement the committee merely reported briefly upon its activities during the year in securing additional company members for the association. The report stated that fifteen companies had joined during the year, and that those still remaining outside of the Association are all small companies, and it is probable that they will gradually be absorbed into membership.

The report was signed by James E. Gibson, chairman; J. J. Caufield, C. S. Ching, F. W. Hild, George L. Radcliffe, Samuel Riddle, M. S. Sloan and R. W. Spofford.

FEDERAL RELATIONS

General Harries then read the report of the federal relations committee. The report first called attention to the fact that the various measures which were

strongly urged during the previous year and occupied much of the time of the committee were scarcely heard of during the past year. It cannot be assumed that these measures have been permanently abandoned, but doubtless Congress will be slow to enact legislation which will add to the embarrassments and burdens of carriers in these unusual times. The committee, however, referred to the Cummins act, approved on March 14, 1915, providing that the shipper of baggage and other merchandise shall state in writing the value of the goods. While this act was aimed primarily at steam railroads it is also of interest to the electric carriers.

The committee's report also contained an extended reference to the hearing held by the Interstate Commerce Commission on Dec. 18, 1914, at the request of the association in regard to reporting by electric carriers of purely urban accidents and the decision of the commission that such accidents need not be reported. Thus far the Interstate Commerce Commission has not taken up the valuation of the electric lines. The committee finally urged the importance of securing recognition by Congress and the Interstate Commerce Commission of substantial differences between electric and steam railways. When federal legislation affecting carriers is proposed, the operation of steam railroads is ordinarily in mind, but there is always danger that the wording of the act will include electric lines as well.

The report was signed by A. W. Brady, chairman; F. W. Brooks, L. S. Cass, E. G. Connette, H. H. Crowell, Frank R. Ford, E. C. Foster, George H. Harries, Paul Shoup, L. S. Storrs and J. T. Wessels.

The company section gold medal was next awarded to J. N. Bury, local superintendent Manila Electric Railroad & Light Company, and George G. Whitney, Washington Railway & Electric Company, Washington, D. C., received honorable mention.

Before closing the session President Allen announced the appointment of R. I. Todd, Indianapolis Traction & Terminal Company, Indianapolis, Ind.; L. C. Bradley, Birmingham Railway, Light & Power Company, Birmingham, Ala., and Gen. George H. Harries as a committee on nominations. The two committee reports remaining on the morning's program were put over for early attention on Wednesday.

Wednesday Morning Session

At the American Association held Wednesday morning, Oct. 6, 1914, the first business was the presentation of the report of the committee on the Anthony N. Brady medal, by C. S. Sergeant. This report recommended a few slight changes in the conditions of competition for the medal.

The report of the committee on compensation for carrying United States mail was then read by W. H. Collins, Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y.; and on the president's recommendation the convention moved a vote of thanks for the courteous consideration given the committee by Senators Bourne, Weeks and Bankhead. An abstract of this report follows:

COMPENSATION FOR CARRYING UNITED STATES MAIL

The report of the committee on compensation for carrying United States mail consisted of a résumé of its activities during the year. In pursuance of the work begun under the preceding committee, data sheets were sent out early in October, 1914, by the bureau of fare research, to which was delegated the work of com-

piling and preparing the needed detailed information. The results of the analysis handed to Senator Bourne, chairman joint Congressional committee, on Nov. 11, 1914, included the following material:

1. Letter of transmittal, containing draft of proposed bill and Exhibit I, showing mail revenue together with operating revenues, expenses and taxes, and car-miles for all companies rendering full and compartment car service.

2. Exhibits II and III, consisting of an itemized study of costs as prepared by the Boston Elevated Railway and the Omaha & Council Bluffs Street Railway.

3. Exhibits IV and V, consisting of a copy of a previous communication to the Hon. John A. Moon, chairman of the House committee on post-offices and post roads (dated Dec. 11, 1913).

After Nov. 11, 1914, a large amount of additional information was furnished to the joint Congressional committee, and a second conference was held in Washington on Nov. 30, 1914, at which a tentative draft of a bill prepared by the joint Congressional committee was presented and discussed. This bill was further

analyzed and criticised in a letter to Senator Bourne, dated Dec. 2, 1914, and substitute provisions were therein proposed.

Prior to expiring on Dec. 1, 1914, the joint committee presented to Congress on Nov. 30, 1914, a preliminary report, reading in part as follows:

"Early in our investigation hearings were granted to representatives of electric lines, but we found that conditions applicable to transportation over steam roads and over electric and cable car routes were so entirely different as to necessitate independent investigation and reports. Since our report of Aug. 31, 1914, we have devoted our attention to the matter of transportation over electric and cable car routes and have collected a vast amount of data and worked out a tentative plan. We find that the time has been insufficient to verify the data collected and to satisfy ourselves of the desirability of the tentative plan evolved.

* * * Should Congress desire the electric and cable mail pay study completed it will be necessary to extend the life of our joint committee. In such event, we respectfully recommend that the time for submission of our final report be extended from Dec. 1, 1914, to on or before April 1, 1916."

The life of the joint committee, however, was not extended and it expired on Dec. 1, 1914. Pending developments concerning the continuance of this committee, a bill has been prepared embodying the results of the studies which had been made. It was planned in case the committee was not continued to have this bill introduced in Congress by one of the members of Senator Bourne's committee, as representing, although of necessity unofficially, the conclusions reached by the joint committee. It appeared later that this was not feasible, and under date of Jan. 11, 1915, Henry S. Lyons for the A. E. R. A. committee submitted to Senator John W. Weeks of the Senate post-office committee certain amendments to the post-office bill, H. R. 19,906, the adoption of which would not have placed the handling of United States mail by electric lines on a remunerative basis, but would have helped to lessen the loss which the present basis of pay constantly entails. At the same time there was submitted to Senator Weeks by the bureau of fare research certain desired information, together with a copy of a proposed bill approved by the A. E. R. A. committee, authorizing and directing the Postmaster-General to adjust the compensation to be paid electric and cable car companies for the transportation of mail. A conference was held in Washington on Jan. 29, 1915, which availed nothing and Congress adjourned without affording the electric railways relief.

Since that time the activities of the A. E. R. A. committee were confined to the giving of such assistance as possible to individual companies in their efforts to have their compensation for carrying United States mail placed by the Postmaster-General on a less unsatisfactory basis. There is said to be hope for ultimate success along the lines on which it has been working, and it is recommended that provision be made for further prosecution of the work.

The report was signed by A. R. Piper, chairman; W. H. Collins, P. N. Jones, H. S. Lyons, J. K. Choate, T. C. Cherry and H. A. Nicholl.

Next the association received and accepted with businesslike dispatch the reports of the committees on electrolysis and ways and means, read by the secretary, on company sections and individual membership, read by E. J. Blair, Chicago Elevated Railways, on dues of company section members, read by W. F. Ham, Washington Railway & Electric Company, Washington, D. C., on changes in constitution and by-laws, read by R. I.

Todd, Indianapolis Traction & Terminal Company and on relation with state and sectional associations. These reports are abstracted below.

ELECTROLYSIS

The American Association committee on electrolysis stated that it has stood ready to act upon any matters which might properly come before it, but has felt that it could best accomplish the purposes for which it was appointed by keeping in touch with the activities of a similar committee of the Engineering Association and with the association delegates to the joint national committee to consider electrolysis. The joint national committee is making satisfactory though slow progress in harmonizing the various interests, while engineering and technical questions were understood by the committee to be under study by the Engineering Association committee on electrolysis. The continuation of the American Association committee was recommended. This report was signed by Calvert Townley, chairman; R. P. Stevens and L. E. Woodbridge.

WAYS AND MEANS

The committee on ways and means of the American Association reported that at the 1914 convention there was approved an amendment to the constitution and by-laws by which the dues of the company members of the association were increased from a minimum of \$15 and a maximum of \$600 to a minimum of \$25 and a maximum of \$750. The new scale became effective as of the fiscal year 1915, during a period of great financial depression which has seriously affected the revenues of the railroads throughout the country. Despite this, however, the member companies accepted the new scale with barely a word of complaint, thus manifesting not alone that they were satisfied that the increase was a necessity but also that they were convinced that the returns justified the additional expenditure.

The substantial character of the returns to the association from company members under the new arrangement is shown by the fact that during the entire year, ended Sept. 30, 1914, the receipts from company annual dues amounted to \$38,328, whereas up to Sept. 13 of this year the total of dues from company members was \$51,806, an increase of \$13,478 or 35 per cent, with seventeen days of September, 1915, remaining in which to obtain additional collections.

The resignations during the year owing to dissatisfaction with the increased dues were, without exception, from companies paying comparatively small amounts of dues, the highest paid under the old scale by any one of these companies having been \$100. The total number of companies withdrawing on this account was twelve, the total amount of money involved, on the basis of the new scale being \$900. The total number of companies withdrawing during the year was thirty-five, which, on the basis of the new scale of dues means a loss to the association of \$2,675, this, of course, including the amount which would have accrued from companies which resigned because of the institution of the new scale. Another very satisfactory condition is the small number of delinquent member companies on Sept. 13, 1915, these totalling but twenty-one, with a maximum amount of dues involved of \$1,775.

The individual membership, while showing no increase in the net, should be considered as satisfactory, inasmuch as during the year between 600 and 700 new members were enrolled, which would have brought about a substantial increase in the total had it not been for the loss of Manufacturers' Association members because of their failure to attend the San Francisco convention.

The bureau of fare research has been maintained throughout the year and data of permanent usefulness have been developed by its director. It was the understanding that the association would appropriate \$2,500 per year toward the maintenance of this bureau and that the balance, up to a maximum of \$5,000, would be contributed by various member companies. The members of the committee on the cost of passenger transportation service have already contributed \$2,000 toward the cost of the bureau, but it has not been thought wise to ask for contributions from the members generally in view of the fact that the receipts of many of the companies have shown serious reductions in the past year. It is expected, however, that the committee on the cost of passenger transportation service will underwrite the bureau to some further extent so that, if possible, the resources of the association will not be drawn upon for anything more than the total amount originally set aside for the maintenance of the bureau.

The ways and means committee indorses the proposal to reduce the dues of members of company sections. This would undoubtedly result in material increases in the individual membership of the association, as well as broadening substantially the scope of its influence. The recommendation contemplates the distribution only of the magazine *Aera* to such members, therefore reducing the expense to the association, though not altogether proportionately to the reduction in dues from \$5 to \$2. The increased membership, however, will readily compensate for this reduced fee.

Measures of economy have been practised during the year just closed, the most obvious of which is the removal of the headquarters of the association from the United Engineering Societies' Building to the building at 8 West Fortieth Street, New York City. This change brought about a gratifying reduction in the amount of rent per year and in addition provides a more convenient and advantageous layout of space for the headquarters officers.

The report was signed by J. H. Pardee, chairman; H. C. Clark and H. C. Donecker.

COMPANY SECTIONS AND INDIVIDUAL MEMBERSHIP

The American Association committee on company sections and individual membership reported that the membership of the association has been increased during the year to approximately 3700 and that the list of company sections has been increased by the addition of the Chicago Elevated Railway Company section, No. 6, which, beginning on April 17 with 139 members, has increased its membership to 178. A number of companies are interested in the formation of sections. The committee issued during the year a pamphlet explaining the advantages of company section work. The committee indorses the recommendation of the special committee on company section dues, stating that the proposed lowering of the dues would remove the objections of a large number of railway employees to affiliation with the association.

The report was signed by Martin Schreiber, chairman; E. J. Blair, H. A. Bullock, B. C. Edgar, H. H. Norris, R. P. Stevens and G. G. Whitney.

DUES OF MEMBERS OF COMPANY SECTIONS

The American Association committee appointed to consider the matter of dues paid by members of local company sections, recommended the creation of a class of membership to be known as company section members to which any employee of a member company shall be eligible. It was recommended further that the dues

should be \$2 per year, that each such member should receive a copy of the association magazine and that all members of sections should be entitled to vote for officers of company sections under the conditions prescribed by the section by-laws.

The committee pointed out that company section membership at the present dues will probably be limited to those employees who may be drawn from the supervisory force, or who by virtue of technical training feel that they are entitled to look forward to supervisory positions in the future. The present dues place membership beyond the reach of all but the better-salaried employees. Utility of membership in a company section is not appreciated by the ordinary run of mechanics and trainmen. Electric railway operation presents many problems, the control of which lies largely with the employee. One of the prime purposes which led to the inauguration of the company section movement was to give an opportunity for discussing these problems, and this requires that the membership be drawn liberally from all departments and occupations in the employer companies. The committee did not believe that subsidies in the form of payment of parts of annual dues for employees would solve the problem, but they believe that a reduction in the dues as recommended would do so.

CHANGES IN CONSTITUTION AND BY-LAWS

The committee on changes in the constitution and by-laws of the American Association recommended the changes necessary to provide for a new grade of members to be known as company section members, as recommended by the special committee appointed to consider the matter of dues of individual members who are members of company sections, and to permit revision of the constitution and by-laws at special as well as regular meetings.

In place of specifying the publications which are to be received by company section members, the committee recommended that this be left to the discretion of the executive committee in order that these members might be furnished with as many publications as can be afforded. With the exception of the implied limitation as to the publications to be furnished to company section members, it was recommended that they have all the privileges of individual membership.

The purpose of the recommended changes as to amendments was to make it possible to amend the constitution and by-laws at the mid-year meeting. In order, however, to safeguard the by-laws, it was recommended that in all cases the same provision be made as previously existed in connection with changes in the constitution, namely, that a copy of the proposed amendment shall have been sent to each of the active members at least thirty days prior to the date of the meeting at which it is to be acted upon.

The report was signed by R. I. Todd, chairman; L. S. Storrs and E. B. Burritt.

RELATIONS WITH STATE AND SECTIONAL ASSOCIATIONS

At a meeting of the committee to consider relations with state and sectional associations on Jan. 11, 1915, it was decided to collect information concerning electric railway associations touching on the location, functions, affiliations, dues, costs, membership, etc., in order to determine, if possible, ways and means by which the expense to members of associations might be lessened and the duplication of work eliminated.

As a result of a consultation with T. C. Martin, executive secretary of the National Electric Light Association, concerning the working of that association in

its geographical sections, the committee concluded that the plan maintained in that association is impracticable so far as the American Electric Railway Association and other electric railway associations are concerned. At this time there does not appear to be any feasible way of affiliating state and sectional organizations with the national association involving the matter of dues.

The committee suggested that the association arrange to insure the attendance at the annual meetings of representatives of the various associations so that the work of the year in different localities can be discussed. If the suggestions offered later are carried out, at subsequent conventions there will be better results as to attendance of association representatives at such meetings. It was further recommended that the executive committee of the American Association arrange to insure the attendance at the annual meetings of each state and sectional association of a representative of the American Association who will set forth the need for co-ordination of effort and explain the methods by which this may be brought about.

Another suggestion was that the committee on sectional associations be instructed to consider the development of standards to the end that matters of standard practices or equipment may develop ultimately through the American Association and thus avoid the adoption of a standard by a sectional association which is inconsistent with one already approved by the national association. If the electric railways of the country were a unit in pushing the adoption of a basic code of operating rules the advantages to this industry would be apparent.

The committee also recommended that there be instituted a plan by which the state associations will keep the national headquarters in touch with legislation in their respective districts. Laws of the utmost importance to railways are constantly being passed in the various states. The association headquarters could serve as a clearing house for information of this kind.

The report was signed by R. P. Stevens, chairman; H. C. Donecker, Patrick Dubee, Ernest Gonzenbach, J. F. Hamilton and C. L. S. Tingley.

The report of the committee on public relations was next read by Charles N. Black, United Railroads of San Francisco. It referred to the appointment of four sub-committees at the meeting held in New York on Jan. 25, 1915. On account of the illness of J. H. Pardee his sub-committee had been unable to meet, but the others have done considerable work. They have found, however, that the carrying out of their proposed plan on a large scale will require a fund larger than it has been possible for the association to provide out of its regular revenues. The committee recommended that its work be continued and that it receive an appropriation sufficient to enable it to do its work in a broad way.

The address on "The Evils of Government Ownership," prepared by former United States Senator Jonathan Bourne, Jr., was read by Charles L. Henry in the necessary absence of the writer. The address is given in full elsewhere in this issue. The convention passed a vote of thanks for the very able paper prepared by Mr. Bourne, following which A. H. Ford, Cumberland County Power & Light Company, Portland, Me., read the report of the committee on insurance abstracted below.

INSURANCE

The committee on insurance reported that data sheet 140, for 1914, calling for information in regard to insurance, fires, fire losses and fire-prevention equipment, was filled out and returned to the association by 160 companies. The combined reports showed the follow-

ing data: Amount of insurance carried, \$205,684,548; amount of premiums paid, \$964,383; amount of fire losses, \$202,512; amount recovered, \$167,408; ratio of recoveries to losses, 82.6 per cent; premiums per \$100 of insurance, 47 cents; losses per \$100 of insurance, 10 cents; recoveries per \$100 of insurance, 8 cents; ratio of losses to premiums, 21.3 per cent; ratio of recoveries to premiums, 17.35 per cent, and number of fires, 235. Table A attached to the committee's report shows these data by states. The committee expressed its regret that so few companies furnished the statistics called for. Compilations of the causes of fires and the classes of property damaged could not be made at all on account of lack of data. The committee appended to its report an index of all reports made to the American Association and the Engineering Association on the subjects of fire prevention and insurance and the discussions thereon. A similar table was made a part of last year's report, but was not printed in the proceedings.

The report was signed by H. J. Davies, chairman; E. J. Cook, A. H. Ford, F. A. Healy and F. J. Spaulding.

J. J. Reynolds, Boston Elevated Railway, read the report of the committee on the operation of motor vehicles, J. V. Sullivan, Chicago Surface Lines, that of the Aera advisory committee, and W. F. Ham, the report of the committee on standards for car loading, all of which were passed without discussion. Abstracts of these follow.

MOTOR-VEHICLE OPERATION

The report of the special committee on motor-vehicle operation to the American Electric Railway Association stated that in sixty cities reporting, the number of jitneys show varying decreases from 100 per cent to 19 per cent. Wherever the requirement of a reasonable bond or license is exacted, the immediate effect has been to decrease the number of vehicles operated. There has also been a decrease due to economic causes, irrespective of regulation, and where railway companies have tried the operation of the jitney, in spite of the efficient methods employed, it has been proved conclusively that the business is unprofitable, notwithstanding the fact that in these instances overhead or shop costs were absorbed in other operations of the companies.

Statistics covering 163 cities in which jitney buses are operated show that 112 of these cities have passed regulatory ordinances and that such measures are under consideration in fifteen other cities.

The committee again urged that railway companies should place before the public the fullest information in regard to the jitney. A quantity of data concerning the operation and regulation of the jitney has been collected by the secretary of the association and is on file for the use of member companies, and the widest use should be made of this material. Some companies have not as yet been confronted with the jitney problem, but the history of the movement shows that it may come upon them without warning, and it is especially important that they inform themselves, through the association's data, of the experience of other companies and by so doing be prepared to meet such situations as may arise.

It was recommended that the work of the committee be continued during the ensuing year, to consider among the other phases of the situation the following: (1) A study of the legal phases of ordinances and state laws regulating jitney traffic. (2) A compilation of rules adopted by public service commissions for the operation of jitney buses. (3) A study of the procedure of regulating commissions in granting applications for the right to operate jitney buses.

The committee recommended also that the association should at this time begin a thorough investigation of the motor bus (distinct from the type of automobile known as the jitney) as a feeder, auxiliary or competitor of electric railway traffic, and that a committee should be appointed to consider the subject.

The report was signed by Britton I. Budd, chairman; H. G. Bradlee, William A. House and C. L. S. Tingley.

THE ASSOCIATION MAGAZINE

The *Aera* advisory board directed attention to the fact that the magazine is now in its fourth year. It was founded for the purpose of furnishing a means of intercommunication among the members and a convenient means of reference, and to give permanency of record of the association work. Since its institution it has given monthly an authoritative and lasting account of the association's activities, has marked the progress of the tremendous volume of committee work conducted continuously, and has kept the members in close touch with plans for the future. It is a needed and dignified form of advertisement for the association, being the association's publicity *per se*.

The committee includes representatives from each of the affiliated and allied associations who are charged with the duty of developing interest among the different associations along their respective lines, such interest manifesting itself in contributed articles touching upon the work of the various departments. Despite the pronounced business depression during the year, a very satisfactory quota of advertising has been obtained and

the committee expressed its appreciation of the work of Charles C. Pierce, representing the Manufacturers' Association, for what he had done in this direction. The committee believed that the current year would see the magazine nearly if not entirely self-supporting. The circulation is 5800 copies. Attention is drawn in the report to the change in typographical arrangements made during the year and particularly to the new cover design.

The report is signed by H. C. Donecker, chairman; E. H. Baker, J. K. Choate, J. H. Hanna, L. T. Hixson, C. G. Rice, J. V. Sullivan and C. B. Wells.

The American Association Committee on Standards for Car Loading stated that while there had been a number of responses to a request for data on standards for car loading it had proved impracticable to get these into form for presentation in time for the October meeting. The committee therefore requested that it be permitted to present its report at the mid-winter meeting of the association.

The Wednesday session ended with a statement by Gen. George H. Harries, Omaha Electric & Power Company, Omaha, Neb., of the value of the publication of the decisions of public service commissions begun the first of this year. He said that only fifty member companies had subscribed for the reports and urged that more companies take advantage of the service.

Following the session the members of the association attended an illustrated lecture on the methods of illumination employed at the exposition, by W. D'A. Ryan, illuminating engineer General Electric Company.

Thursday Morning Session

The first item on the program for Thursday, Oct. 7, 1915, was the presentation of the report of the committee on cost of passenger transportation service, which was read by Charles N. Black, United Railroads of San Francisco.

COST OF PASSENGER TRANSPORTATION SERVICE

In its report the committee directed attention to the report of the director of the bureau of fare research to the association, which covers the scope of the work performed by that bureau under the general direction of this committee. The committee states further that F. W. Doolittle, director of the bureau, has nearly completed the preparation of the monograph on "Studies in the Cost of Urban Transportation Service," the completion and printing of which could not be accomplished in time for submission to the convention. It should, however, be completed in time for distribution with the volume of current proceedings.

The committee recommended further that the work of the bureau of fare research be discontinued upon completion of that now in hand and revised when funds for the support of the bureau become more readily obtainable.

The report of the committee was signed by James D. Mortimer, chairman; Charles N. Black, Henry D. Bradlee, Thomas N. McCarter and Paul Shoup.

An outline of the monograph mentioned above is given below.

STUDIES IN COST OF URBAN TRANSPORTATION SERVICE

PREFACE

PART I. THE OCCASION FOR COST OF SERVICE

CHAPTER 1. CREATING THE STREET RAILWAY

Introduction. Obtaining of franchises. Promotion expenses. Financing the enterprise. Cost of change of motive power. Ex-

penses incurred in consolidation. Receivership. Unproductive capital expenditures. Influence of capital investment on cost.

CHAPTER 2. THE STREET RAILWAY AS A GOING CONCERN

What creating and operating the going concern contributes to cost. Organization of the corporation. Organization of the traction utility. The work of the transportation department. Rolling stock department. Way and structures department. Purchasing and stores department. Accounting department. Legal department. Employees' welfare. Work of safeguarding the public.

PART II. ELEMENTS OF COST

CHAPTER 3. THE ANATOMY OF THE 5-CENT FARE

Proportionate division of 5-cent fare. Street railways of United States, 1912, 1907 and 1902. Typical urban surface railways. Elevated and subway. Proportionate division of labor, material and expense. The street car nickel and the jitney nickel. Proportionate division of fixed and variable costs. Proportionate division of terminal and movement cost. Proportionate division of revenues and expenses throughout day.

CHAPTER 4. TENDENCY OF OPERATING COSTS

Growth of the industry. Increase of service furnished due to area served and consolidation. Increased length of ride for the single fare. Decrease in receipts per passenger due to increased use of transfers. Effect of changes in speed, change of equipment and frequency of service on cost. Increase of municipal requirements. Increase in unproductive investment. The decreased purchasing power of the 5-cent fare as compared with the general increase in the cost of money, labor and material. General conclusions.

CHAPTER 5. UTILITY CAPITAL AND ITS REPLACEMENT

Relation of utility capital to cost of service. Purposes of valuation of street railway property. Sale, taxation, basis of reasonableness of public requirements, condemnation. Theories: market value, sacrifice and equivalent agency. Methods: security values, book values, reproduction estimates, appreciation and depreciation, going value. Replacement of utility capital; adequacy of provisions for insuring replacement, inadequacy of statistical data, theories of measurement of replacement insurance reserves.

CHAPTER 6. ACTUAL RETURNS IN THE TRACTION BUSINESS

Relation of reasonable return to cost of service. Actual returns upon various theories of value. Factors determining the reasonableness of returns in the traction business.

CHAPTER 7. UNITS OF COMPARISON

Unreliability of the single unit of comparison; adaptability of specific units to general analysis. Use of units of comparison in cost analyses. Practical limitations of accounting classifications and statistical data. Fixed and variable expenses, treatment of specific accounts. Typical schedule of apportionment. Technical notes on statistical processes to determine functional relation between units of comparison and operating cost items.

PART III. ELEMENTS OF SERVICE

CHAPTER 8. TRAFFIC CHARACTERISTICS

Peculiarities of the public demand for service. Typical traffic characteristics. Use of models. Statistical measurement of traf-

fic variation. Effect of variations on loading. Difficulty of estimating service required. Seat-miles and passenger-miles. Controlling factors in the plan of study to be adopted.

CHAPTER 9. TRAFFIC SURVEYS

Function of the organization. Field work. Office work. Supervision. Type of organization. Purpose of survey.

CHAPTER 10. TRAFFIC OBSERVATIONS

Frequency and regularity of collection of data. Preliminary work. Length of period of observation. Data to be taken on field. Loading estimates. Data to be recorded. Recording data.

CHAPTER 11. THE APPLICATION OF TRAFFIC DATA

The determining factors in schedule making. Minimum headway. Meeting points. Use of trippers. Traffic requirements. Transition period. Short routing. Other considerations. Average length of ride. Average length of ride of standing passenger. Traffic data in service cases. Frequency of heavy loads. Factors affecting ratio of seats to passengers. Factors affecting determination of standard of loading. Relation of maximum to average loading. Instantaneous ratios not significant. Necessary factors in loading rules. Permissible variation from normal service.

CHAPTER 12. PRESCRIBED STANDARDS OF SERVICE

Regulation of service. Methods of defining adequate service. Prescribed standards: New York, Milwaukee, St. Louis. Variation in prescribed standards. Recommended standards: Chicago, Philadelphia, St. Louis, Pittsburgh, San Francisco, Kansas City, Providence, Cincinnati, Winnipeg. Difficulty in formulating standards. Diversity. Car capacities. Variation of passenger demand. Cost of service. General conclusions.

CHAPTER 13. PSYCHOLOGICAL ASPECTS OF STREET RAILWAY SERVICE

Importance of the psychological aspects of car service. Results of tests in Cleveland and Milwaukee as to impressions of actual and reasonable headway, comfortable load, rate of fare and service. Definition of satisfactory service. Satisfaction with service. Impressions of courtesy of conductors, route and destination signs, transfers, reasonable walking distance, trail and center-entrance cars, service in other cities. Conclusions.

PART IV. SPECIAL PROBLEMS

CHAPTER 14. THE PAYING HAUL—COST OF EXTENDING FARE, LIMITS AND LINES

Effect of expansion of cities on area served for single fare. Relation of extensions of passenger haul to other service and cost. Methods proposed for determining paying haul. Ford "car-mile" formula. Bradlee "car-haul" formula. "Load factor" formula of C. N. Duffy. Typical problems analyzed: (1) Cost of extending single-fare point into second-fare zone; (2) cost of extending existing line by construction. Determination of paying haul upon passenger-haul or car-haul basis.

CHAPTER 15. THE PAYING HAUL—COST OF SERVICE AND THE ZONE SYSTEM OF FARES

The American system of flat rates for urban passenger transportation service. Reasons for adoption. Advantages and disadvantages. Recent progress away from flat rates. Factors opposed to and favorable to change. Zone system of fares: advantages and disadvantages. Cost factors involved in construction of zone system of fares: necessary information, basis apportionment of cost. Typical problem analyzed.

CHAPTER 16. COST OF COMPLYING WITH SERVICE STANDARDS

Effect on cost of variation of number of car-hours required under service standards at various periods during the day. Index of concentration of service as a function of cost. Typical problem analyzed: (1) analysis of cost of service during various hours of the day; (2) effect on cost of increase of rush-hour service; (3) effect of uniform service throughout twenty-four hours. Comparison of cost per car-hour and return on investment during various periods of the day under above conditions.

CHAPTER 17. COST OF EXTENDING THE TRANSFER PRIVILEGE

Growth of the transfer privilege and effect on revenues and cost of service. Causes of development of transfer ratio: advantages and disadvantages of free transfers. Typical problem analyzed: effect on revenues, diversion of traffic from old to new routes, possibility of fraud, influence on riding habit, increase of number of rides on cost.

CHAPTER 18. COST OF COMPETING FORMS OF TRANSPORTATION

Influence of transportation on city growth. Effect of competing transportation agencies on cost of service. Forms of transportation developed in American cities: walking, private conveyance, public conveyance. Field of competition as limited by cost to individual, cost to community, comparative service and costs of jitney and street railway.

CHAPTER 19. EFFECT OF RATE OF FARE ON RIDING HABIT

Public interest in rate of fare. Purposes of studies of riding habit. Factors affecting riding habit: facilities, topographical conditions, climatic condition, temperamental characteristics, competitive facilities, special conditions. Experience of various cities. Increase in riding habit with increase in population. Technical notes on statistical processes to determine degree of correlation of riding habit and rate of fare.

CHAPTER 20. THE PROBLEM OF RAPID TRANSIT

Time as a factor in transportation. Comparison of transit facilities in other cities. Unwarranted conclusions. Cost factors of rapid transit systems. Necessary traffic density. Comparison with cost of operation with surface lines. Suggestions for improvement of present surface traction facilities: skip stops, trailer operation, traffic regulations and routing.

PART V. REGULATION AND THE COST OF SERVICE

CHAPTER 21. REGULATION AND THE COST OF SERVICE

Cost and value of service theories. Considerations which have made cost of service a controlling question in rate regulation. The cost of service theory and efficient management. Importance of cost of service in the two types of regulation: regulation by contract and continuous regulation.

CHAPTER 22. THE CLEVELAND EXPERIMENT. EVENTS PRECEDING THE TAYLER ORDINANCE.

First proposals of Tom L. Johnson in 1903. Results of trial of 3-cent and 4-cent fares. Status of competitive franchises and in

the courts. The "holding company" plan. Rejection of proposals for renewal of existing franchises after arbitration. Joint use by competing companies of track to public square. Abandonment of Central Avenue line. The "curative ordinance." Mayoralty campaign of 1907. Further efforts for a "holding company." Neutral railway company. The "security franchise." Lease of property to municipal traction company. The beginning of 3-cent fare. The Schmidt street railway law. Defeat of "security franchise" on referendum. Receivership of Municipal Traction Company. Increase in fares under receivership. Preliminary proposals for a settlement franchise. More efforts at competition. Arbitration. The mayoralty campaign of 1909. Decision of Judge Tayler.

CHAPTER 23. THE CLEVELAND EXPERIMENT (CONTINUED). THE TAYLER ORDINANCE AND DEFECTS IN ITS OPERATION AS DISCLOSED AT ARBITRATION

The provisions of the Tayler ordinance. Difficulties during first period of operation. Amendments of July 14, 1911. Changes in rate of fare. Events preceding arbitration. Defects of plan based on allowances. Issues presented at arbitration. Difference between interest fund and corporate surplus. Deficiencies in allowance for maintenance, depreciation and renewals. Deficiencies in allowance for operation. Findings of arbitrators on allowances. Status of sundry reserves under the ordinance. Legal right of company to overexpend allowances. General conclusions drawn from facts presented at arbitration.

CHAPTER 24. THE CLEVELAND EXPERIMENT (CONTINUED). EFFORTS SINCE ARBITRATION TO REDUCE COST OF OPERATION TO PERMIT CONTINUATION OF LOW FARES

Termination of lines in center of city. Designated stops. Increased schedule speed. Decreased accident hazard. Policy with respect to extension of lines. Paving costs. Control of traffic. Short-routing.

CHAPTER 25. THE CLEVELAND EXPERIMENT (CONTINUED). SERVICE RENDERED UNDER ORDINANCE REGULATION

Factors affecting service. Density of traffic. Short-routing. Type of district served. Types of rolling stock. Loading and collection practice. Car movement as assisted by skip stops, trailer cars, near-side stops, traffic ordinances. Transfer points. Car loading. Basis of investigation. Measurements of service as compared with standards applied elsewhere. Length of ride. Riding habit. Psychological factors in measuring service. General conclusions.

CHAPTER 26. THE CLEVELAND EXPERIMENT (CONTINUED). ACTUAL COST OF SERVICE UNDER ORDINANCE REGULATION

Financial results for two ordinance years ended Feb. 28, 1915. Deficiency in allowances under the ordinance. Lack of provision for depreciation. Analysis of balance sheet of Dec. 31, 1914. Unit costs of service. Paying haul. Cost of increasing service to Wisconsin and Chicago standards. Conclusions.

CHAPTER 27. THE MILWAUKEE EXPERIMENT. EVENTS PRECEDING THE RAILROAD COMMISSION OF WISCONSIN DECISIONS OF AUG. 23, 1912

Agitation for 4-cent fare in 1896. Determination of reasonableness of ordinance by United States Circuit Court. Early adjudications of value and cost. The 1900 franchise. Railroad commission law of 1905. Agitation for 3-cent fare in 1906. Audits and appraisals. Testimony on cost.

CHAPTER 28. THE MILWAUKEE EXPERIMENT (CONTINUED). THE DECISION OF AUG. 23, 1912, AND ITS RESCISSION JAN. 30, 1915

Synopsis of decision on reasonableness of rates of fare. Cost factors determining reasonableness, joint costs of urban, suburban and interurban service, basis of valuation, depreciation allowances, and rate of return. Appeal on contractual nature of 1900 franchise. Events preceding the Woehsner appeal. Cost calculations for succeeding years. Synopsis of rescinding decision of Jan. 30, 1915. Withdrawal of appeal by city.

CHAPTER 29. THE MILWAUKEE EXPERIMENT (CONCLUDED). COST OF SERVICE AND DECISIONS ON LINE EXTENSIONS, ZONE SYSTEMS, TRANSFERS AND SERVICE REQUIREMENTS

Commission's cost basis of extending fare limits. Events preceding order of zone system of fares. Synopsis of Commission's order. Cost factors in orders extending transfer privilege. Service standards: description of factors affecting service in Milwaukee; synopsis of Commission's orders on service, cost factors and service standards; experiments of short-routing and skip-stop practice. Conclusions.

FOUNDATION PRINCIPLES OF VALUATION

The address on the above topic was then read in extended abstract by the author. An abstract of this address is printed elsewhere in this issue of the ELECTRIC RAILWAY JOURNAL. A supplementary abstract will appear in a later issue. The speaker was listened to with close attention and he was warmly applauded at the close. A vigorous discussion followed.

Prof. C. L. Cory, Dean of the College of Mechanical and Electrical Engineering University of California, was called upon to open the discussion. He stated his agreement with, and emphasized the significance of the fundamental features of Mr. Arnold's statements. The importance of fully understanding that a property may have different values to be used for different purposes he considered to be very great. He gave a closely-reasoned statement pointing out that a community should protect the downtown traffic of the electric railway company. His argument was based upon a statement which formed an underlying feature of Mr. Arnold's paper. This was to the effect that it does not make any difference who owns the street railway system, but the service

is all important. The public must be served for all time, hence the investment must be perpetuated. As soon as one begins to think that the investment may be depreciated, it follows that service must deteriorate. The greatest economic result is obtained when the best service is given at the lowest cost that gives a fair return on the time, money and brains invested. A depreciation fund invested in extensions is better for the community than a sinking fund. By way of illustration Professor Cory stated that he is familiar with a large property on the Pacific Coast which has made extensions amounting to 50 per cent of its entire property in five years, when it would have been unable to obtain all of the money for these extensions on reasonable terms through investment bankers. He said that there is another important point, the importance of which professors of political economy do not always realize. This is the social side of the problem. He mentioned the development of numerous attractive suburbs resulting from a uniform fare and believed that a suburban fare varied according to mileage is against the common good.

In this connection he asserted that it is quite impossible for a railway of the ordinary kind to maintain its investment if the public allows any economic change to come about which will rob that system of its exclusive enjoyment of the downtown business. If some other transportation system takes the cream of the downtown business, the fares to the suburbs must be greater. Such a plan is against the common good. It makes no difference in this respect whether the investment is made by a municipality or by a private company. Regarding the question of divorcing urban and interurban lines, which Mr. Arnold had discussed under the head of severance, as an item which must be considered in value, Professor Cory cited a recent case in a city of the Northwest which is the center of what is popularly termed "an empire served by a unified urban and interurban system." There was an investigation of the possibility of divorcing the urban and the metropolitan system, and after careful study it became apparent to the public and the city authorities that a separation would cause the public to suffer. As level streets and good paving shortly made the municipality a favorable field for jitney buzzards, the city had no great desire for the local business and the lack of necessity for readjustment stood as a demonstrated fact.

C. E. Grunsky, president American Engineering Corporation, San Francisco, read in discussion a carefully-prepared statement which he opened by agreeing with Mr. Arnold's statement in regard to the unfortunate results to owners from the invention by somebody of the word "depreciation." Depreciation has nothing in common with amortization except that the current lessening of worth which the word denotes has been made a measure of the rate at which capital should be amortized. Any writing off of the depreciation when a rate base is to be established is fundamentally wrong.

Mr. Grunsky did not favor land appreciation in valuation, although it has been forced upon engineers and accountants who have been put to it to find some fair way to protect owners against unreasonable handling of depreciation. He protested strongly against the assumption that because depreciation exists the service lessens in value, or that capital has been amortized because a certain amount of depreciation has accrued. In other words, the amortization of capital is a matter apart from depreciation and it is unfortunate that the loose use of terms has led the courts and some of the public service commissioners into error. Early losses are not elements of value but should be taken into account when a rate is being determined so that the owner may receive protection. On the theory of unlimited life

no change in efficiency is to be assumed. Lessening of worth of any shares should have no bearing upon the charge for the service rendered. The San Francisco Municipal Railways, although pointed to now as a financial success, have not yet stood the test of the cessation of exposition traffic and nothing is said of the added burden on passengers who can no longer travel where they wish on a single fare or of the burden upon the competing company. In conclusion, he agreed with, and emphasized the importance of Mr. Arnold's statement on necessity for an arrangement which would give both flexibility and reward for efficient service.

General Harries referred to Mr. Arnold's paper in an appreciative way, saying that it might be taken by member companies as a safe and sure guide prepared in the form of a text-book. Commenting upon the unfair competition with electric railways that has recently developed, he pointed out that though it may endure for a time in violation of the fundamentals of honest policy it was, because of that violation, predestined to certain failure. Mr. Crecelius explained that the subject matter of Mr. Arnold's paper has long been under consideration by the association, and that there has been a strong sentiment in favor of preparing a suitable property ledger.

TAXATION MATTERS

The report of the committee on taxation matters was next received and filed. This report directed the attention of the association to changes in tax laws affecting street railways as reported by the following States: California, Connecticut, Maryland, Oregon, Pennsylvania, Rhode Island and Virginia. The most important of these follow. In California Senate amendment No. 38 (Chapter 46) will be presented to the voters at a special election on Oct. 26, 1915. The

TABLE I.—TAXES PAID BY ELECTRIC RAILWAY COMPANIES OVER A PERIOD OF YEARS

Year	Operating Railway Revenue	Taxes	Taxes Percentage of Operating Railway Revenue
1902.....	\$247,553,999	\$13,078,899	5.28
1907.....	418,187,858	19,755,602	4.27
1912.....	567,511,704	35,027,965	6.26
1914.....	308,579,255	21,583,158	7.00

Figures for 1902, 1907 and 1912 from United States Bureau of Census—for 1914, the result of summary from data sheet 138.

amendment abolishes the State Board of Equalization and substitutes therefor a Tax Commission, but does not provide in any way for the appointment of the Tax Commission or for the number of members of same. The provisions of this amendment are very broad and can be construed to mean that the Legislature, at each biennial meeting, can define that certain classes of property can be assessed solely for State purposes or otherwise. Another bill in this State provides that a fund of \$75,000 be appropriated to investigate and report upon the existing matters of revenue and taxation.

In Connecticut every corporation operating a steam or electric railroad, or street railway, and carrying on business for profit in the State, must pay annually a tax upon the gross earnings from all sources from its operations in the State, that is, its gross operating income as defined for railroads by the Interstate Commerce Commission. The tax rate on gross earnings of steam or electric railroads, other than street railways, is 3½ per cent; the rate on gross earnings of street railways is 4½ per cent. The amount of taxes paid during the year in any town on the real estate not used exclusively in the business of such corporation, or of any corporation all of whose property is operated by such corporation, is to be deducted from the amount of the tax upon such gross earnings.

In Oregon a bill was passed which prohibited the

levying of a greater amount of revenue in the taxing district than the larger amount levied on the assessed value of the same property in either of the two years immediately preceding plus 6 per cent; provided, however, that the levy may be increased by the voters of the taxing district at a general election, or a special election called for the purpose of voting on such proposition.

In Pennsylvania a new law imposes a tax on the sale of or agreement to sell capital stock, and upon the delivery or transfer, the tax being at the rate of two cents for each \$100 face value of stock.

House Bill No. 113 in Virginia fixes the situs for taxation of rolling stock of electric street railway companies and provides for the assessment thereof and the taxation of such rolling stock, and the apportionment of the taxes among the several counties, cities, towns and school districts, in or through which any such electric railway is located. This bill makes no distinction in the rate of taxation between such rolling stock and other property of the companies, but simply provides for its distribution locally. It may be a little more troublesome to the companies, but otherwise is unimportant. House Bill No. 102 increased the fran-

chise tax on street railways from 1 per cent upon gross receipts to $1\frac{1}{8}$ per cent. This was the only bill passed by the Legislature increasing the tax burdens upon street railways.

Indiana has appointed a committee to investigate the tax laws of other States and make recommendation at the next session of the Legislature, which will meet in 1917.

According to the reports received, the committee found a noticeable falling off in the amount of tax legislation aimed at street railway corporations, owing no doubt largely to the change of public sentiment toward corporations in general. A data sheet was sent out to all of the companies and replies from eighty-three were tabulated as shown in the accompanying tables. The comparison of the figures of 1904 with 1914 shows an increase of 69.7 per cent in the gross earnings and 90.8 per cent in the amount of taxes.

The committee concluded that the electric railway industries are no doubt bearing an unfair proportion of the tax burden, and some concerted efforts should be made to secure the enactment of uniformity in tax laws by which the taxing of street railways would be removed from local control, and either fixed on a fair percentage of gross earnings or else assessed on a valuation which would be determined by a central taxing commission, the basis of the valuation to be distinctly stated by the commission and such taxes to be in lieu of all other taxes. At present the tax is assessed under such a variety of names and for such varied purposes that the general public, and very often the street railway officials, are not aware of the excessive amounts borne by the railways as compared with the burden borne by other properties. By adopting such a method as a tax on gross earnings in lieu of all other taxes, the claim which is so often made, that the public service corporations are not bearing their just proportions of the tax burden, could easily be refuted.

The report was signed by F. W. Wilson, chairman, for the committee.

AMERICAN ROAD BUILDERS' ASSOCIATION

The committee appointed to attend the fifth American Good Roads Congress, held in Chicago Dec. 14 to 18, 1914, under the auspices of the American Road Builders' Association, as representatives of the American Association reported that the members had attended the congress and as a result believe that the American Road Builders' Association should receive the attention of the American Association. In the opinion of the committee, it now has and will continue to have an important effect upon the electric railway industry. The object of the American Road Builders' Association is to extend the "good roads" movement: to use its influence to see that public money appropriated for road building is wisely expended, and to bring about an improvement in the manner of construction and maintenance of highways and of materials used for those purposes. The committee believed that the engineering features of good road building, including the construction and maintenance of paving in city streets, are so closely related to electric railway work that the exhibits at the annual meeting of the Road Builders' Association and the discussion of the science of good road building will be sources of valuable information to the Engineering Association.

Another point is that the "good roads" movement, which is national in scope, will quite naturally increase the use of privately-owned vehicles and thus divert a certain amount of traffic from the interurban railroads. The general improvement of the highways will also have an important bearing upon taxes, property values,

development of territory, etc. Whether the additional traffic derived from such development of territory will be sufficient to offset the loss sustained by the increased use of privately-owned vehicles is a matter which should receive the study and attention of a special committee. The committee therefore recommended attendance upon future meetings of the Road Builders' Association by a committee containing representatives of the American and Engineering Associations, and that this committee, in addition to attending the meetings, should study the "good roads" movement as it affects the electric railway industry and collect data relating thereto, making its report to the association. Incorporated with the report of the committee was a copy of the proceedings of the congress.

The report was signed by E. C. Faber, chairman; C. D. Emmons and C. N. Wilcoxon.

The report of the nomination committee, read by R. I. Todd, Indianapolis Traction & Terminal Company, was as follows: For president, Charles L. Henry, president Indianapolis & Cincinnati Traction Company; for first vice-president, L. S. Storrs, president The Connecticut Company, New Haven, Conn.; for second vice-president, Timothy S. Williams, president Brooklyn Rapid Transit System, Brooklyn, N. Y.; for third vice-president, John J. Stanley, president The Cleveland (Ohio) Railway; for fourth vice-president, J. H. Pardee, president Eastern Pennsylvania Railways, Pottsville, Pa. The report of the nominating committee was adopted in full by the convention and the ballot cast by the secretary. In assuming his new duties, President Henry said he would devote his best efforts during the coming year to aid the enterprises of the association.

In connection with the report of the nominating committee Gen. George H. Harries explained that John A. Beeler, second vice-president of the association, had requested that his name should not be considered by the committee as he had a number of plans to carry out which would make great demands upon his time. General Harries said that all the members could testify to their warm regard for Mr. Beeler and on their behalf expressed the hope that in a short time he would again be an active operating man in the field of electric railway transportation.

The report of the committee on resolutions, presented by C. S. Sergeant, Boston Elevated Railway, contained an appreciation of the courtesies extended to the convention delegates by the member companies, civic bodies and individuals in the several far western cities. The thanks of the association were extended particularly to the San Francisco committees of the Manufacturers' Association which provided for the entertainment and transportation and which made other local arrangements for the convention, and to the technical press for its effective co-operation in carrying out the work of the association generally. A final clause in the resolutions urged members to make every effort to secure adequate regulation of motor-vehicle competition.

After accepting the report of the committee on resolutions the convention formally adjourned. The exercises scheduled for Friday are described on page 767 of this issue. They formed a part of the entertainment program of the convention and consisted of the presentation of a bronze plaque to the American Electric Railway Association and the American Electric Railway Manufacturers' Association in commemoration of the holding of the 1915 meeting at San Francisco. The address delivered by James H. McGraw on this occasion on "The Development of the Electric Railway" is abstracted earlier in this issue.

Accountants' Papers and Proceedings

President Mitchell Reviews Work of Year and Submits Question of Separate Meeting Place and Time for Association—Delegates Discuss the Value of Statistics in Administration, Taxation, Passenger Accounting and Various Technical Points of General Interest

Program for Monday

Annual Address of the President.
Annual Report of Executive Committee.
Annual Report of Secretary-Treasurer.
Reports of Committees:
Standard Classification of Accounts—H. L. Wilson, chairman.
Accounting Definitions—Frederic Nicholas, chairman.
Representing Association at Convention of Railway Commissioners—W. F. Ham, chairman.
Education—George G. Whitney, chairman.
Express and Freight Accounting—E. L. Kasemeier, chairman.
Passenger Accounting—L. T. Hixson, chairman.
Joint Report, Passenger and Express and Freight Accounting—Co-Chairmen: L. T. Hixson and E. L. Kasemeier.
ADDRESS—"Taxation of Electric Railways," Prof. Carl C. Plehn.
Report of Committee:
Transportation-Accounting—Co-Chairmen: M. R. Boylan and J. K. Choate.

Program for Tuesday

PAPER—"Electric Railway Accounting—A Review," P. V. Burlington.
PAPER—"The Merits of Prepayment Cars, from the Viewpoint of the Accounting Department," R. J. Clark.

C. S. MITCHELL
President

Tuesday—Continued

PAPER—"The Value of Statistics to Executive and Accounting Departments," George B. Willcutt.
Report of Committee:
Claims-Accounting—Co-Chairmen: H. J. Davies and H. K. Bennett.

Program for Wednesday

Reports of Committees:
Engineering-Accounting—Co-Chairmen: F. H. Sillick and C. R. Harte.
Life of Railway Physical Property—Co-Chairmen: R. N. Wallis and Martin Schreiber.
Changes in Constitution and By-Laws.
ADDRESS—"Treatment of Charges for Rent of Tracks and Facilities and Rent of Equipment," Paul Shoup.
PAPER—"The Importance of Accrued and Accruing Accounts from the Viewpoint of the Certified Public Accountant," John F. Forbes, C.P.A.
ADDRESS—"Some Neglected Problems in Electric Railway Accounting," Henry Rand Hatfield.
Reports of Convention Committees:
(a) Resolutions.
(b) Nominations.
Election and Installation of Officers.

Monday Afternoon Session

PRESIDENT C. S. MITCHELL, comptroller Pittsburgh (Pa.) Railways, called the first meeting of the Accountants' Association to order on the afternoon of Monday, Oct. 4. After the printed minutes of last year's meetings had been distributed, President Mitchell read his address, which is in part as follows:

"At the convention last year, on the recommendation of M. W. Glover, secretary Mobile Light & Railroad Company, Mobile, Ala., a resolution was adopted providing for a rearrangement of the committees of the association, and the appointment of certain standing committees, a majority of whose members should hold over from one year to the next in order to give continuity to the work of the committees. This was undoubtedly a step forward in providing for the constructive work of the association, as those members who appreciate their appointment and do conscientious work have an opportunity to carry forward their ideas, while such members as do not take an interest can and should be replaced by members who will bring new thoughts into the committees.

"The resolution referred to provided for a representation of five members from this association on the joint committee on transportation-accounting. The Transportation & Traffic Association at its last convention did not act on the matter of increasing its membership from three to five. The matter was taken up with the president of that association and on Nov. 12, 1914, its executive committee passed a resolution that a joint committee of ten members would be too large for effective

work, and that better results would be obtained from a committee of six, as originally provided for. It was voted, therefore, that the representation of the Transportation & Traffic Association remain as originally constituted, and that a recommendation be made to the Accountants' Association that its membership on the committee also be limited to three men. In order that the committee might proceed with its work, three members were appointed for the current year with the approval of the executive committee of this association, but some action should now be taken as to the future membership of this committee.

"One year ago all lines of business were affected by a general business depression, and as there was some possibility of a loss in revenue to the American Electric Railway Association by the withdrawal of member companies on account of the increased scale of dues, it was the unanimous opinion at the first meeting of the new executive committee that the revenues for the year should be carefully guarded and the expenditures minimized without interfering with the progressive work of the different associations. At the same time it was recommended that all committee meetings be dispensed with at the mid-year meeting held in Washington, D. C. With this in mind at the time of committee appointments, assignments were made, as far as possible, of members who could meet as often as necessary without contracting large traveling expenses. With an improvement in business conditions generally, it is hoped that more liberal appropriations will be made in the future for the work of this association.

"The reports presented this year speak for themselves and indicate how thoroughly the committee work has been done. Special attention should be called to the work undertaken by this association through its committee on education. The lectures arranged for this year include an elementary course, a feature which should appeal strongly to such clerks engaged in street railway work as have not had an opportunity to study the theory of accounts. A better understanding on the part of the average office employee, through a knowledge of accounts, of the purpose to be attained by the work upon which he is engaged, would no doubt result in increased efficiency. Each accounting officer should appoint himself a booster for the cause and make every effort to enlist not only the employees under his own immediate jurisdiction but those employees in other departments whose duties are of a clerical nature.

"Effective as of July 1, 1915, the Interstate Commerce Commission issued its accounting bulletin No. 9, containing decisions upon questions raised in 346 cases under the uniform system of accounts for electric railways. The commission acknowledges the co-operation of the committee on a standard classification of accounts in the preparation of this bulletin. These decisions are invaluable to street railway accounting officers, and the association is indebted in no small measure to the members of this committee for the part they have taken in this work. On account of the great number of questions submitted by electric railway accountants from all sections of the country, the members of this committee are required to write several thousand letters a year, and it should be borne in mind that the time of its members and the stenographer's services, postage, etc., are all contributed without expense to this association.

"For some time past the association has had a special committee on overhead charges, but in spite of diligent effort made this year to have some of the most experienced accountants accept membership on this committee, it was found impossible to complete the committee for service during the year. This is a subject which, to be handled successfully, requires the judgment of experienced accountants and engineers, and it is herewith recommended that its study be delegated to the joint committee on engineering-accounting.

"Since the meeting last year the United States Internal Revenue Department has issued a new form (No. 1031 revised) to be used by corporations in making a return of their annual net income, under Sec. 2 of the act of Oct. 3, 1913. In this is incorporated a supplementary statement requiring that certain detailed information be furnished, a greater part of which is not a matter of convenient record with those companies who keep their accounts in accordance with the uniform system of accounts for electric railways prescribed by the Interstate Commerce Commission, now used by electric railways quite generally. It is therefore suggested that a committee of this association be delegated to take up the matter of more uniformity in the accounting methods required of electric railways in making their reports to the different departments of the government.

"The association's attention is called at this time to the report of the committee on the federal income tax, presented at a conference of the National Tax Association in San Francisco last August. This committee recommends a complete restatement and clarification of the law, there being general dissatisfaction with its complexity and strong objection to several of its provisions which are contrary to the principles of just taxation, work unnecessary hardship and result in unfair discrimination between various classes of taxpayers. There is a possibility of this law being amended by Congress

at its next session, and it is suggested that electric railway accountants familiarize themselves with the report of this committee and discuss its merits with their representatives in Congress.

"As to the future of the association, the question of a separate meeting time and place is submitted for thoughtful consideration. Under such conditions a larger attendance could be secured of the younger men engaged in street railway accounting work, if the association were to meet at such a place as would best suit the convenience of the majority of the members, and at a time when other department heads were not absent from their duties attending the meetings of the affiliated associations. At the same time, more actual work would be done in two or three full-day sessions and greater good accomplished if the attention of members were not diverted by exhibits and entertainments."

EDUCATION AND OTHER REPORTS

After the reading of the president's address, reports were received from the executive committee and from the secretary-treasurer. Reports were then read for various committees as scheduled.

The committee on education simply presented as its report to the association the minutes of the meetings held on March 22, 1915, and June 17 and 18, 1915. These meetings were taken up with discussion of details of administration of the educational courses, and they were duly reported in the columns of this paper from time to time during the last few months.

After this report an announcement was made to the effect that Edward C. Stothart of the Charleston Consolidated Railway & Lighting Company, Charleston, S. C., had been awarded the \$50 prize for the best paper submitted on the eighth lecture of the accountants' correspondence course. This was noted in the ELECTRIC RAILWAY JOURNAL of Sept. 18, page 594, and the prize paper was abstracted in the issue of Oct. 2, page 665.

The committee on accounting definitions in its report directed attention to the important work now being undertaken by the committee on accounting terminology of the American Association of Public Accountants. At the annual meeting in September, 1915, this committee, starting with the first of the alphabet, defined thirty-four terms beginning with "a." This first installment included, for example, definitions of "additional capital," "additions to capital" and "amortization," all of which touch matters that are involved in the systems of accounts prescribed by public service commissions. As it appears that the American Association of Public Accountants will give serious attention to definitions for the next few years, the committee of the American Electric Railway Accountants' Association recommended that a committee on accounting definitions be continued and that such a committee for the next year ask the committee of the American Association of Public Accountants for an opportunity to be heard or to submit views by correspondence in connection with the definition of terms that may directly affect electric railways. The report was signed by Frederic Nicholas, chairman; R. N. Wallis and G. A. Harris.

The committee of W. F. Ham, chairman; Henry L. Davies and C. L. S. Tingley reported that it had represented the association at the twenty-sixth annual convention of the National Association of Railway Commissioners held in Washington, D. C., Nov. 17-20, 1914. The proceedings of this convention are in print and may be procured, at nominal cost, from the Law Reporting Company, 115 Broadway, New York. The subjects discussed covered a wide range of matters vital to all

public utilities, including railroad taxation, plans for ascertaining a fair valuation of railroad property, railroad capitalization, statistics and accounts. The report of the committee on statistics and accounts of electric railways was spread upon the minutes of the convention without being read and, therefore, without discussion or action.

STANDARD CLASSIFICATION OF ACCOUNTS

The committee on a standard classification of accounts reported that it met with Interstate Commerce Commission representatives in Washington last January, when two days were devoted to going over publications which the commission proposed to issue. During the year the commission issued an index to the uniform system of accounts for electric railways. This index, composed of about twenty-eight pages, superseding the six-page one found in the back of the publication on the uniform system of accounts, afforded a very quick reference to the general accounts and the primary accounts. Not only is the reference page given but the section and note references as well.

A few months ago Accounting Bulletin No. 9 was sent out by the commission to all accounting carriers. This embodies decisions upon questions raised since the uniform system, effective on July 1, 1914, was adopted, as well as revised decisions on important questions previously submitted. It includes 346 cases and has two complete indices, one by accounts and one by topics, comprising in all thirty-five pages. Since the copy was given to the public printer eighty-two cases were submitted directly or through the commission to the committee for decision, the answers for which were published in *Aera*.

While the committee does not assert that the new system is perfect, from one year's use by a large number of companies there is reason to believe that it is reasonably so, and its adoption by many of the state commissions strengthens this opinion. The only change made during the year is one under the general instructions relating to the road and equipment accounts. In the original issue permission was granted to a company to charge the cost of an addition or betterment (where the amount was less than \$200) to the appropriate operating expense account if it so desired. This option was taken away by an order of the commission effective on July 1, 1915, from which date all charges for improvements and betterments must be included in the road and equipment accounts regardless of the amount involved.

The committee states that although the association has not yet published the uniform system of accounts, it is the intention to provide in the near future a single book embodying the text of all the accounts, the index and all case decisions. Member companies may then purchase direct from the association as many copies as desired.

The report was signed by H. L. Wilson, chairman; W. F. Ham, W. H. Forse, Jr., P. S. Young and Robert N. Wallis.

EXPRESS AND FREIGHT ACCOUNTING

The report of the committee on express and freight accounting last year contained a brief outline covering the method of handling freight business and making reports and records. On account of the inquiries received since that time from members doing a freight business, the committee this year deemed it advisable to supplement the preceding report by outlining the methods for handling interline business and explaining other matters in connection with freight transportation accounting. Under the heading of "Interline Way-billing Arrangements," therefore, the present commit-

tee discussed the forms used; the arrangement for interline billing with the audit office settlement; waybills; waybill corrections; abstracts and division statements; statement of difference and correction account; summary and settlement; tracing unreported waybills; astray freight, and misrouted freight.

Concerning the interchange of equipment the committee decided that, to prevent delay and cost of transferring, it was advisable to let cars go through to destination. In order that the company owning the car might be paid for its use, however, some definite method should be adopted to provide for such car rental or use. The rate for such a freight trail car should be high enough to make the using company handle the shipment promptly and return the car at the earliest possible time, but it should not be so high as to prevent the use of one company's cars by another in these through carload movements. The lines in Indiana, Michigan and Ohio, comprising the Central Electric Railway Association territory, have an agreement to charge 50 cents for every twenty-four hours or fraction thereof, with a minimum charge of 50 cents against each company using the car each time on its lines. This agreement also provides that a junction agent should, for billing purposes, make to the auditor of the company owning the car (with a copy to the auditor of his own company), a report showing car initial, number, loaded or empty, road delivered to, exact time of day and date.

Furthermore, the committee stated that a majority of the interurban roads are now using the unit waybill for local shipments, making four or more parts, two of which go with the shipment, one part being the delivery receipt and the other part the expense bill. At nearly all important stations weekly credit is extended to large patrons, and it is, therefore, necessary to make two additional copies of bills which cover freight moving prepaid—one to be used as a receipt to shipper when collection is made at end of week, the other to be used by the station cashier. At some station, these "prepay charge" bills represent 30 per cent of the total bills made. Under these circumstances the committee felt that it was exceedingly advantageous to use a machine in preparing the bills on account of the less effort required and the greater ease of deciphering. Typewriters are now being made for this purpose. They are shiftless machines, using only capital letters, and are provided with special tabulating mechanism. The committee strongly recommended that this feature be looked into as it might save much labor and trouble now experienced by reason of illegible bills.

The report was signed by E. L. Kasemeier, chairman; H. B. Cavanaugh, A. E. Dedrick, Walter Shroyer and H. H. Read.

PASSENGER ACCOUNTING

The committee on passenger accounting reported that it was surprised to note from a perusal of the forms forwarded by the various companies that auditing departments still continue to prepare reports and statistics containing information necessary and valuable to the management and transportation departments when the fare was invariably a nickel, transfers were unknown, cars were of a uniform size, and the present-day interurban, with its infinite variety of fares, was unknown. Much of the information laboriously compiled for these daily reports has lost its value to the traffic and schedule departments. Nevertheless, the auditing department in many cases continues to prepare daily comparative and cumulative statements giving the earnings of each route or division in dollars and cents, the earnings per car-hour and per car-

mile. The original object of these reports was not only to show the management the profitableness of each route, but to enable it to gage the traffic conditions and schedule requirements. To-day most of these elaborately compiled reports do not give this information. Frequently a preponderance of reduced fare tickets exists on one line or route, or one route may be essentially a transfer-passenger carrying route. In either case, the earnings per route, per car-hour or per car-mile do not show traffic conditions or schedule requirements. The introduction of front-end collectors in congested districts also tends to lessen the value of showing earnings per car-hour and per car-mile by routes. For this reason many companies are ascertaining their schedule requirements by traffic counts made by inspectors on various parts of the system. In the committee's opinion, therefore, the auditing department should co-operate with the transportation department and give the passengers per car-hour and per car-mile. This would enable the management and the transportation department to form some idea of the profitableness and the schedule requirements of each route. For those routes where no traffic count is made this information could be readily obtained by the accounting department from the data contained in the conductors' reports.

The committee stated that the most valuable statistical information on interurban lines in addition to the usual car-hours and car-miles is the revenue per passenger-mile by trains. Under present conditions, this information is impracticable on account of the cost of obtaining it. When available, however, it should be supplemented by reports showing the passengers on the car at various points, inasmuch as a small train earning per passenger-mile might mean congestion for a short ride and empty cars the balance of the trip; while larger earnings per passenger-mile might be received from a moderate load for the long haul.

While it was believed that the reduction in fares has reached its limit, there is an increasing tendency in the use of ticket fares, and the committee felt that if the companies should join in adopting a uniform size of ticket, inventors and manufacturers would be induced to widen their field for manufacturing and distributing ticket-counting machines. Reports from several companies showed that they no longer laboriously counted the tickets by hand, but obtained the earnings by weighing the tickets received from each conductor or fare box.

It appeared to the committee that the handling of cash might be improved and simplified. Instead of the collections being turned over from one employee to another and finally by the cashier at the head office to the bank, there would be a great saving in time if these remittances could be made directly to the bank by the agent or conductor. In some cases the bank is so anxious for the railway company's account that it collects the money from the local cashier.

The report was signed by L. T. Hixson, chairman, R. J. Clark, John M. C. Horn, T. B. MacRae and Irwin Fullerton.

DISCUSSION ON PASSENGER ACCOUNTING

This latter report brought out a general discussion of the relative merits of the bag system and the car-house receiver system of taking in cash tickets and transfers. Those participating were A. H. Kayser, general auditor San Diego (Cal.) Electric Railway; T. P. Kilfoyle, auditor Cleveland (Ohio) Railway; F. W. Frost, secretary-treasurer San Francisco-Oakland Terminal Railways, Oakland, Cal.; G. B. Willcutt, secretary and comptroller United Railroads of San Francisco,

San Francisco, Cal.; J. H. Neal, general auditor Boston (Mass.) Elevated Railway; W. G. Nicholson, secretary and auditor Omaha & Council Bluffs Street Railway, Omaha, Neb.; W. F. Ham, vice-president and comptroller Washington Railway & Electric Company, Washington, D. C.; President Mitchell, and Secretary M. R. Boylan, general auditor Public Service Railway, Newark, N. J.

In San Diego, according to Mr. Kayser, the cash is taken from the carhouses to the main office, where instead of being sent to the bank it may be turned over to another company under the same control. Mr. Frost told how his company's method of picking up packages and counting at the main office gives more protection, is cheaper and gives reports by lines early in the afternoon of the succeeding day. Mr. Mitchell mentioned a small line which has the money taken directly to the banks by carhouse employees, the money not being counted by company employees after it leaves the conductor's hands. Mr. Boylan told how the receiving system has eliminated shortages, disputes and arguments, for although there might be shortages in tickets or transfers and registers, there were none in cash. Mr. Willcutt described a reduction in shortage since bell-punch days. Mr. Kayser thought that the elimination of any question between the company and men as to the amount turned in justified the expense of a receiving clerk.

According to the statement made by Mr. Neal, until three years ago the Boston Elevated Railway had used the bag system, and when the union asked for the car-house receiving system the company pointed out that it would cost from \$25,000 to \$50,000 more. Such a system was put in, however, and the expense was found to run about as estimated. Desiring to count tickets at the same time as cash, the company has put in a new machine, which counts 60,000 tickets an hour, to count these automatically while the receiver counts the cash. When the cash is brought into the main office, it is counted a second time by a machine that both counts and wraps. This company uses a lot of the money for the payroll, part of which comes up for payment every day.

ADDRESS ON TAXATION

By a change in the program the joint report on passenger and express and freight accounting was postponed until Tuesday, and the scheduled joint session with the Transportation & Traffic Association was omitted, as no report of the committee on transportation-accounting was in hand. The remainder of the session was then devoted to an address on "Taxation of Electric Railways," by Prof. Carl C. Plehn, University of California, Berkeley, Cal.

Professor Plehn took as the key to his discussion a consideration of the burden of taxation as it affects the investment. He said that the taxes on all classes of public utilities appear to be growing faster than the capital invested therein, faster than the net earnings and faster than the gross receipts. It was highly desirable to determine accurately how much the burden of taxation is and how fast it is growing, which, surprising as it seems, is not now known. His paper then described an attempt to work out a method of establishing a practical measure or index of the tax burden, in order to show clearly just what the incidence is on electric railways and other public utilities.

Professor Plehn's remarks were discussed by Mr. Neal and Mr. Ham, who supplied particular instances in order to show the need of giving close consideration to local conditions in attempting to work out a method that would be susceptible of being applied to companies generally.

Tuesday Afternoon Session

The first business on the program on Tuesday was the reading of the following joint report on passenger and express and freight accounting, postponed from the day before.

The committee on passenger accounting held a joint meeting with the committee on express and freight accounting in Chicago on June 15, 1915, when the subject of allocation of passenger and freight earnings and expenses was considered. As stated in the report of the joint committee with the Transportation & Traffic Association in 1911, and also in the report for 1912, it is impracticable, if not impossible, to make an exact segregation of the expenses. Many of the large items can be easily divided, but there are numerous accounts which must be prorated on the most reasonable basis in view of the labor involved. The present committee felt, therefore, that the general plan outlined by the 1911 committee is the best obtainable under the existing conditions. In view of the fact, however, that the 1911 report was based on the old Interstate Commerce Commission classification, the committee revised the former report so as to make it fit the classification which is now in use.

It was jointly recommended that the committee on passenger accounting and the committee on freight and express accounting be consolidated, as all matters can be handled by one committee. The report was signed by L. T. Hixson and E. L. Kasemeier, co-chairmen; R. J. Clark, Irwin Fullerton, J. M. C. Horn, T. B. MacRae, H. B. Cavanaugh, A. E. Dedrick, H. H. Read and Walter Shroyer.

In the discussion of this report Mr. Kayser suggested that items for losses, damages and injuries might be prorated on the basis of located passenger and freight items instead of totals. Others discussing the paper were B. W. Fernald, auditor San Francisco-Oakland Terminal Railways, Oakland, Cal.; H. A. Culloden, secretary and auditor Pacific Electric Railway, Los Angeles, Cal.; I. A. May, comptroller The Connecticut Company, New Haven, Conn., and T. W. Gregory, director East St. Louis & Suburban Railway, East St. Louis, Ill. President Mitchell mentioned that the report more particularly applied to interurban properties handling carload freight. Mr. Kilfoyle moved that the report be received and filed, and its recommendation, that the committee on passenger accounting and the committee on express and freight accounting be consolidated, be taken up under the head of new business. When the recommendation later came up it was adopted, and it was decided to have a new committee of five members.

After the foregoing discussion was ended, P. V. Burington, secretary the Columbus Railway, Power &

Light Company, Columbus, Ohio, read his paper on "Electric Railway Accounting—A Review." This was followed by a paper on "The Merits of Prepayment Cars from the Point of View of the Accounting Department," by R. J. Clark, comptroller Metropolitan Street Railway, Kansas City, Mo. Abstracts of these papers are published elsewhere in this issue.

Mr. Clark's paper brought on a lively discussion, in which considerable attention was devoted to the probability of the future development of a satisfactory transfer-issuing machine and a smaller and simpler transfer. Those participating in the discussion were Mr. Neal, Mr. Kilfoyle, Mr. Ham and Secretary Boylan. Mr. Neal agreed that the development of mechanical devices had been one of the important results of the introduction of prepayment cars. In his opinion, the motor-driven coin box, while it cannot be used on short runs, where it must be shifted frequently from one end to the other, is a valuable innovation that is bound to be permanent. He believed that the ideal transfer will carry only date, time, car or conductor's number and location from which and to which issued. The elements necessary for a successful transfer-issuing machine are already in existence in different devices, notably in employees' time clocks. In using transfer-issuing machines the line should be divided into sections and only from two to twenty points should be covered by one machine.

Mr. Kilfoyle stated that in Cleveland the company used a locked fare box with no registering devices whatever. Mr. Ham said his company in Washington was using the register system entirely, but had recently ordered ninety to 100 cars with the prepayment feature. Replying to a query from Secretary Boylan, Mr. Neal said that with an improved transfer and automatic machine there would be no occasion for having the slip longer than 2 in. or 2½ in. In his response Secretary Boylan pointed out that this would help secure the essential small size in a transfer machine to go on the platform with a fare box and leave table room enough for the conductor. Mr. Neal said the ideal machine would be a transfer machine and fare box combined, with one motor and one stand.

At this point George B. Willcutt, secretary United Railroads of San Francisco, read his paper on "The Value of Statistics to Executive and Accounting Departments." This is published elsewhere in abstract form. President William Tichenor of the Claims Association then announced that as a report from the joint committee on claims-accounting had not been received, the scheduled joint meeting of the Accounting and Claims Associations would be unnecessary.

Wednesday Afternoon Session

The program for the Accountants' Association on Wednesday afternoon was opened by a joint session with the Engineering Association with President Mitchell of the former association in the chair. Two reports were presented—one on engineering-accounting and one on the life of railway physical property, as shown below. In connection with the former report, it was explained that the section dealing with the development of a continuous inventory related not to the entire property but only to stock materials. Next year, according to President Crecelius of the Engineering Association, the committee will have the subject of

a continuous property ledger to work on as a result of a recent decision that was arrived at by the executive committee.

ENGINEERING-ACCOUNTING

The report of the joint committee on engineering-accounting was to cover the following: (a) Cost accounting: draft of set of standard forms for use with the system recommended by the 1914 committee. (b) Revision of subdivisions of operating maintenance accounts to meet the requirements of the new Interstate Commerce Commission classification. (c) Development

of a proper ledger looking toward the maintenance of a continuous inventory.

COST ACCOUNTING FORMS

The cost accounting system recommended by the 1914 committee contemplated a set of correlated forms on which to record various particulars for each job or undertaking. The duty laid upon the 1915 committee to draft a set of forms for use with this system was found to be a perplexing one, for each member company had its own peculiarities of organization and other local conditions which in many cases seemed to necessitate widely differing methods of compiling and forwarding reports. The present committee therefore departed somewhat from the letter of its instructions, and instead of embodying in its report a set of blanks to be considered as standard, it submitted two sets of blanks which were selected as in most particulars covering all the requirements of the system, leaving it to the member companies to choose, each for itself, such features as might seem best to suit its own individual requirements or to cull out from these blanks such features as might serve to amplify the system which it already had in operation. The forms submitted include the following: Series A—details of estimated cost of material and labor covered by application; details of estimated salvage material (including scrap) to be abandoned, removed or replaced and returned to stores or to be used on the work; application for authority to proceed with and for appropriation to cover cost of additions, betterments,

replacements and ordinary repairs; notification of completion of work; final accounting statement showing distribution of amount expended; report of salvage material returned to stores; Series B—estimate sheet, including on reverse side actual or estimated original physical cost of structure to be improved or replaced; distribution sheet for expenditures; notice of completion of work, and certificate of completion of authorization.

REVISION OF SUBDIVISIONS OF MAINTENANCE ACCOUNTS

The 1914 convention of the Accountants' Association having adopted the uniform system of accounts for electric railways as prescribed by the Interstate Commerce Commission, effective on July 1, 1914, the joint committee made a rearrangement of the maintenance and operating sub-accounts under the same or similar accounts of the new classification. Inasmuch as there appeared to have been made no subdivisions of the traffic and general expense accounts, it was not thought necessary to repeat the commission captions for these.

In making the modifications the committee was impressed with a doubt as to the value of such minute detail and intricate subdivisions, but it did not feel justified under its instructions in making any amendments or simplifications. It recommended, however, that the matter of operating and maintenance account subdivisions receive further study by future committees with a view of simplification.

CONTINUOUS INVENTORY

The term "continuous inventory" was understood to mean a record of stock materials on hand which at all

[illegible][illegible]

CONTINUOUS INVENTORY—FORM I—SHOWING ORIGINAL
RECEIVING TICKET (8½ IN. X 11 IN.)

CONTINUOUS INVENTORY—FORM II—SHOWING BIN TAG

the experience in regard to a great number of units after the manner of human mortality tables. It is mere guesswork to fix the time when any given unit will go out of service, and therefore idle to construct any scientific conclusions upon such a basis. It may be argued that, as with human life tables, it is possible to take a large number of experiences and by averaging them secure an "expectancy." Even if that were true, the time is yet far distant when the industry will have existed long enough to make available sufficient experience to form a basis for such expectancy. The youth of the art and its rapid development make any experience thus far obtained of little value.

The committee believes, therefore, that any estimate of future life, whether regarding an individual unit or a group, is at best a guess and an uncertain and inconclusive one. It notes with satisfaction that there seems to be on the part of regulating commissions, valuation experts and other authorities an increasing recognition of the soundness of this belief. Less and less weighty seems to be the theory that it is possible to predetermine how long a certain unit of property will continue to give service, either through an examination of its own condition or by a comparison with other similar units, which in other places and under other conditions (no matter how similar) may have completed their usefulness. Such a predetermining process is at times necessary, but even then it is coming to be generally recognized as merely an estimate that is largely a matter of judgment rather than of scientific determination.

The report was signed by Robert N. Wallis and Martin Schreiber, co-chairmen; A. R. Patterson, W. H. Forse, Jr., R. F. Rifenberick and J. H. Hanna.

FINAL ACCOUNTANTS' ADDRESSES

After the joint engineering-accounting session the Accountants' Association in its final meeting listened to three addresses by Paul Shoup, president Pacific Electric Railway, Los Angeles, Cal.; John F. Forbes, C.P.A., of Haskins & Sells, San Francisco, Cal., and Henry Rand Hatfield, professor University of California, Berkeley, Cal.

In opening his subject of "Treatment of Charges for Rent of Tracks and Facilities and Rent of Equipment," Mr. Shoup took advantage of his presence with the accountants to mention some of the problems which executives would like to have the accountants solve for them, such as what actually, not theoretically, becomes of the fund created by depreciation charges when the need for the depreciated article or any substitute therefor has passed, and others of an equally perplexing nature. Mr. Shoup spoke highly of the depreciation fund, saying that a very respectable depreciation fund rather elbowed the sinking fund out of the way. It is true that there should be some provisions in mortgages looking to certain conditions being fulfilled before dividends are paid or property alienated, but perhaps the time will come when there will be provisions not for a sinking fund but for a depreciation, obsolescence and amortization fund that shall take precedence over any dividend payments and shall be reinvested for the company's benefit. In relation to the particular subject of rents, Mr. Shoup advanced some arguments based upon his company's experience in favor of treating rents as fixed charges rather than operating expenses, following steam railroad practice. In the following discussion Mr. Ham described the national situation in regard to this question and the disadvantages, complications and burdens that would result from treating rents otherwise than as operating expenses, in view of the great diversity of conditions between urban and interurban developments.

Mr. Forbes' topic was "The Importance of Accrued and Accruing Accounts from the Viewpoint of the Certified Public Accountant." He pointed out that financial statements should be considered in their entirety, for items which alone have one meaning will have their significance greatly altered when read in relation to other items. Mr. Forbes presented details illustrating how operating expenses may be stated in such a way as not to permit the accounts to fulfill their function of furnishing a basis for intelligent comparisons. He devoted special attention to railroad commission expenses, depreciation and taxes, and said that interest on bonds is the one accruing account almost invariably handled properly.

Professor Hatfield, who is the author of well-known works on accounting, had for his subject, "Some Neglected Problems in Electric Railway Accounting." He advanced some interesting new ideas concerning some important fundamental problems that have received special consideration by public utilities since the advent of commission regulation. In discussing the basis for valuation he rejected some of the theories which have been most prominently advanced and said that attempts to form a principle resting on equity have led to hopeless confusion. In the case of public utilities a consideration more fundamental than equity is that having to do with the attraction of capital for developments. This brings up the question of risk, as well as the important one of new competition. Professor Hatfield pointed out the inconsistency of allowing high returns as an offset for possible losses and then demanding that the high rates be reduced in the few cases where the enterprise proved successful. The neglected phase of the valuation problem, therefore, concerns the question of whether the investor is to take risks or whether the public is to go along at a dead level, foregoing the economies coming from new inventions. Professor Hatfield then discussed the real nature of the difference between capital expenditures and charges against revenue.

END OF PROCEEDINGS

After these addresses the association took up the reports of convention committees and on motion of Mr. Kilfoyle, amended by Mr. Neal, voted to dispense with the committee on overhead charges. This action, in line with the recommendation in the President's address, was deemed advisable in view of the fact that under the Interstate Commerce Commission classification future overheads are definitely covered. Mr. Kilfoyle as chairman of the resolutions committee then presented the various resolutions of thanks, and Mr. Neal read the report of the nominating committee.

In accordance with the latter report, new officers were elected as follows: President, T. P. Kilfoyle, auditor Cleveland (Ohio) Railway; first vice-president, L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.; second vice-president, H. A. Culloden, secretary and auditor Pacific Electric Railway, Los Angeles, Cal.; third vice-president, G. C. Whitney, chief clerk Washington Railway & Electric Company, Washington, D. C.; secretary, M. R. Boylan, general auditor Public Service Railway, Newark, N. J.

The following members, besides the officers, were chosen for the executive committee: H. B. Cavanaugh, auditor Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio; P. V. Burington, secretary The Columbus Railway, Power & Light Company, Columbus, Ohio; F. E. Webster, treasurer Massachusetts Northeastern Street Railway, Haverhill, Mass., and F. H. Sillick, comptroller Hudson & Manhattan Railroad, New York.

Sessions of Engineering Association

Committees Reported on Lightning Protection, Standards, Power Distribution, Equipment, Buildings and Structures, Power Generation, Way Matters, Heavy Electric Traction and Electrolysis and Other Subjects—Wood Preservation Discussed—President Crecelius Scores Neglect to Use Association's Standards

Program for Monday

Annual Address of the President.
Annual Report of Executive Committee.
Annual Report of Secretary-Treasurer.
Reports of Committees:
Lightning Protection—D. E. Crouse, chairman.
Standards—H. H. Adams, chairman.
Power Distribution—A. S. Richey, chairman.

Program for Tuesday

Reports of Committees:
Block Signals for Electric Railways—J. M. Waldron, chairman.
Joint Sub-committee on Block Signal Rules—L. H. Palmer, chairman.
Transportation-Engineering—Co-Chairmen: R. N. Hemming and P. N. Jones.
Equipment—W. G. Gove, chairman.
Buildings and structures—C. F. Bedwell, chairman.

Program for Wednesday

Reports of Committees:
Engineering-Accounting—Co-chairmen: C. R. Harte and F. H. Sillick.

L. P. CRECELIUS
President

Wednesday—Continued

Reports of Committees (continued):
Life of Railway Physical Property—Co-chairmen: Martin Schreiber and R. N. Wallis.
Constitution and By-Laws.
Power Generation—J. W. Welsh, chairman.

Program for Thursday

Reports of Committees:
Way Matters—C. S. Kimball, chairman.
Address—"Some Factors Affecting the Application of Wood Preservation to Electric Railways," Carlile P. Winslow and Clyde H. Teesdale.
Reports of Committees (Continued):
Heavy Electric Traction—E. R. Hill, chairman.
Electrolysis—A. S. Richey, chairman.
General Business.
Report of Committee on Resolutions.
Report of Committee on Nominations.
Election and Installation of Officers.
Installation of Officers.

Monday Afternoon Session

PRESIDENT L. P. CRECELIUS opened the San Francisco convention of the American Electric Railway Engineering Association on Monday, Oct. 4, 1915, with a vigorous address, in which he scored the failure of electric railways to take full advantage of the standards that had been adopted by the association, and outlined the vast scope of the committee work accomplished during the past year.

"The past year," he said, "differs from former years of our association's activities, I believe, only to the extent that matters which have been pending for some time have in the majority of cases been brought to a successful conclusion by our various standing committees. This is evidenced by the report of the committee on standards. The association is now in a position to take on a considerable amount of new work, and is therefore in need of subject matter for investigation by these committees. I have pointed out before that the subjects for consideration must be important and timely and of more than purely local interest. They should comprise matters of vital interest to the electric railway industry as a whole. Minor questions should be submitted to the *Aera* Question Box, which has been found in the past year to be a very profitable source for the interchange of ideas. Our membership seems to have shown considerable interest in it, and this feature of the *Aera* is commended to your consideration. Examination of the reports of our various standing committees indicates the interest, thoroughness and good work accomplished during the year. Accordingly, all credit for the successful outcome of the recommendations contained therein belongs to our members and to the representatives of the manufacturers who have participated in the preparation of these reports.

"There are two matters of paramount interest which I desire to bring to your attention and which, in my opinion, must receive the very earnest consideration of our association. They are, first, the question of arousing

more interest in the use of our standards and recommendations which are now available to all, due to the distribution of the Engineering Manual; and second, membership.

"In regard to the first matter, a sub-committee of the committee on standards was appointed to investigate the extent to which the standards and recommendations of the Engineering Association were being used by the member companies. Conditions revealed by this investigation were very unsatisfactory and indicated that our standards are not being used as much as the great value of this work justifies. Now, it seems that advantage should be taken of important work of this character. It must be that member companies fail to appreciate that this work is carefully prepared by the ablest men in our association and thus is of immense value. It follows, therefore, that a primary duty of the association will be to bring this question to an issue and to devise ways and means by which the great importance of our standards will be brought home to the member companies for the purpose of stimulating interest in their use.

"In regard to the question of membership, there has been pointed out in former addresses the great desirability of a large membership in the association, and undoubtedly this is so well understood that the point need not be made again. In line with this question, however, the officers of this association and the American Association have hit upon the plan of including company section members in the membership of the association under an arrangement which, it is felt, will induce a very large class of individuals to join. To make this possible it was necessary to add an amendment to the constitution of the Engineering Association, which will be submitted to this convention for approval. The matter, however, should not end here, and every member of the association is urged to give the question of membership his personal attention. The secretary-treas-

urer's annual report on the finances, when presented for your consideration and approval, will indicate that the expenses incurred by the Engineering Association are somewhat larger than last year. This was not due, however, to the fact that the affairs of the association have been less economically administered. It was due altogether to the very large amount of co-operative work with other societies and associations, requiring frequent and prolonged conferences by our representatives.

The scope of the Engineering Association's activities is reflected by the following statement of co-operative work carried on with other societies and associations:

(1) In connection with the preparation of a National Electrical Safety Code by the National Bureau of Standards, regarding which a number of conferences have been held. (2) Representation on the national joint committee on overhead and underground line construction, the activities of this committee having been very pronounced during the past year. (3) Discussion on clearances for heavy electric traction with the American Railway Association and the American Railway Engineering Association. (4) Electrolysis, with representation upon the national joint committee upon this subject. (5) Fire protection rules and car wiring, in connection with the National Fire Protection Association. (6) Cable stranding, with the American Institute of Electrical Engineers. (7) Standards of design for block-signal apparatus, with the Railway Signal Association. (8) Consideration of the boiler code of the American Society of Mechanical Engineers.

"In addition to the large amount of work indicated above, the details of which fell to the lot of the representatives of our various committees, they have also found time to cover fully the questions submitted to them by the executive committee and included in reports which are to be considered by this convention. Consequently the year has been a very busy one for our standing and special committees. I have the further pleasure to report that the committee on standards has finally included in its report a proposed schedule of regulations covering the style of specifications to be adopted by the association, and you have already observed by examination of the advance copies of the reports that this year marks an epoch in that the committee on power generation has been successful in bringing forward valuable recommendations to be adopted by the association.

"To sum up, the year's work has been found to have been one of unusual activity in regard to co-operation with other societies upon very important questions and in the completion by our standing committees of many matters pending from previous years. It follows, therefore, that the duties devolving upon the secretary and his office force have been unusually heavy, and I have great pleasure in calling attention to the very able and satisfactory manner in which this has been taken care of by him. In closing, I desire to express again my great appreciation of the honor you have conferred upon me, and I wish to add that I will always have a deep interest in and regard for the welfare of the Engineering Association."

The report of the executive committee of the Engineering Association was then presented by Secretary-Treasurer Burritt, who read the minutes of the meeting held on Nov. 10, 1914, and recorded in the issues of the *ELECTRIC RAILWAY JOURNAL* for Nov. 14, 1914, page 1103, and Dec. 12, 1914, page 1301. He also gave the results of two letter ballots, one under date of March 4, 1915, directing that the joint committee on engineering accounting, Engineering Association branch, consider the continuous inventory as covering the entire physical property of electric railways rather than stock

materials alone, and the other dated Aug. 18, 1915, approving the amendment of the constitution to provide for the new proposed grade of company section members.

As secretary-treasurer of the Engineering Association Mr. Burritt reported that the expenditures had exceeded the appropriation of \$4000 by \$459.13, largely due to the numerous meetings of the national joint committee on overhead and underground line construction. He gave the following data:

EXPENDITURES DURING PERIOD FROM OCT. 1, 1914, TO SEPT. 30, 1915	
Executive committee	\$333.78
Committee on building constructions	105.65
Committee on electrolysis	60.92
Committee on equipment	512.36
Committee on heavy electric traction	221.05
Committee on lightning protection	221.05
Committee on membership of purchasing agent
Committee on nominations
Committee on power distribution	749.28
Committee on power generation	425.76
Committee on standards	287.02
Committee on subjects	20.85
Committee on way matters	856.37
Meeting of the American Society for Testing Materials	22.65
Committee on block signals	235.75
Committee on engineering accounting	68.86
National joint committee on overhead and underground line construction	496.38
Committee on transportation engineering	43.35
Miscellaneous	19.10
Total	\$4,459.13
Engineering Manual	715.42
Proceedings	2,557.83
Total	\$7,732.38
Proceedings (accounts payable)	540.88
Grand total	\$8,273.26

The total membership on Sept. 15 was 1871, exactly the same as on Oct. 1, 1914.

Both of these reports were approved as read, after which E. J. Blair, Electrical Engineer Chicago Elevated Railways, and Charles Rufus Harte, Construction Engineer The Connecticut Company, were appointed as a committee on resolutions.

LIGHTNING PROTECTION

The report of the committee on lightning protection was then read in abstract by Mr. Blair, who explained the recommendations in detail. In this report the committee presented data and recommendations on lightning arresters and their installation on cars and on the line. Definitions of the following five types of arresters offered for use on car equipment were given: Multipath spark-gap type; resistor-rod, spark-gap, magnetic type; resistor-rod, spark-gap, mechanical circuit-breaker type; condenser type with shunted resistance and series spark gap, and electrolytic type. For equipment purposes it was recommended that the choke coil should be made of at least ten turns of wire wound on a wooden core with a mean diameter of 5 in.; that the lightning arrester, of whatever type, and the choke coil should be located as near the trolley base as practicable; that the leads to the arresters should not be less than No. 6 wire, the connections being first mechanically strong and then soldered; that a system of inspection be adopted which will provide ample assurance that the lightning arrester is constantly in good order, and that the flashover point of the arrester be set at a voltage as close to the maximum operating voltage of the system as practicable.

Attention was directed to the fact that the lightning protection feature had not been sufficiently considered in connection with car wiring, which may be easily arranged so as to jeopardize the equipment in spite of use of the most efficient lightning arresters. It was therefore recommended that any connection which permits the lightning current to closely parallel controller cables should be avoided; that the placing of a wire carrying lightning current near and parallel for any

considerable length to a wire where damage can be done by an induced charge should be avoided; that the carrying of a lightning arrester connection which extends from the roof of a car to an arrester situated near the floor of the car directly back on itself to the top of the car to a circuit breaker or other connections to the apparatus should be avoided, and that wires connected to the opposite terminals of a lightning choke coil should never be brought within 12 in. of each other.

On the subject of lightning arrester grounding the committee believed that, with a view of preventing induction, the proper location for the car arresters is on the roof. The following recommendations on this subject were also made: That the size of wire used in lightning arrester grounds should not be smaller than No. 6 and that the wires should be of copper; that the ground wire should be separate from other car ground wires and should be as short and straight as possible; that the wires in the lightning-arrester circuit should not be run in conduits and, when possible to avoid it, they should not be run adjacent to magnetic material; that all wires in lightning-arrester circuits should have their connections well soldered, and in case steel cars are used that the lightning-arrester ground should be connected to the nearest steel structure after the fact has been established that this point of connection has intimate and continuous contact through the steel framing of car and ground connections to the motor frame.

Consideration of data secured by the preceding committee indicated that the use of line lightning arresters materially aids in protecting car equipment. Present practice consists in installing from two to seven arresters per mile, about five per mile being the most common practice and this, under ordinary conditions, should give satisfactory results. After describing the different types of line arresters in common use the committee reported its conclusions as follows: Any arrester for use in line service should be compact, rugged and mounted in a well-made weatherproof box. It should also be so designed that an inspection of all parts is easily feasible. The protection afforded by arresters on overhead lines is as important to the safety of car equipments as it is to the trolley wires and stations. An arrester which is to be placed in service for line protection should have as an inherent quality a positive ability to disrupt or prevent the dynamic arc. Any failure in this respect would result in a short-circuit which, owing to its possible remoteness, might prove difficult of detection.

On the subject of line lightning-arrester grounding, regarding which the various interests have not been able to agree, it was recommended that line lightning-arrester ground wires should be connected to a good earth ground and also to the track rail except under the following conditions: Where the current flow on the connections from track rail to earth would exceed an average of $\frac{1}{4}$ amp. during any twenty-four-hour period, this average being determined by considering the algebraic sum of the currents, and where a.c. track block signals of the double-rail type are used. Where the foregoing exceptions exist, and in order to prevent doing away with the rail connections, it was suggested that the connection be made from the line lightning arrester to both earth ground and track rail, but that there should be installed in the circuit between the point where the rail connection joins the lightning-arrester ground wire and the earth ground itself a suitably-designed air gap. The committee thought that under some conditions it would be perfectly safe to make the solid connections to both rail and earth without the air gap, but had not sufficient information from signal

manufacturers to warrant qualification of the recommendation. The committee explained in detail the reasons for the recommendations and included the results of tests made by Prof. Adolph Shane, of the State University of Iowa, giving resistances of various types of grounds. The report stated that the resistances of lightning arrester grounds less than 5 ohms cannot be expected and even under good conditions they may be as great as 50 ohms. Interurban and suburban track well ballasted with rock or coarse gravel may be considered as insulated for the purposes of lightning protection, whereas interurban and suburban tracks not carefully ballasted and sometimes in intimate connection with the upper surface of soil and ordinary city track furnish an added assurance of a good ground connection. On the well-ballasted class of track the connections from rail to earth ground are more necessary for lightning protection than on the other two types, but on the other hand, the objections to the connection will exist more often on such construction.

The committee recommended that the ground connection should be of solid copper wire, not less than No. 4 in size, securely fastened to the back of the pole and, except as noted, well bonded to track rails and either extended as a ground coil or well soldered into a ground pipe. In any case at least 8 ft. of the lower exposed portions should have a non-metallic protection, and any change in direction of the ground wire should be made by easy curves.

The report was signed by D. E. Crouse, chairman; E. J. Blair, J. Leisenring and F. R. Phillips.

In the discussion F. I. Fuller, Vice-president Portland Railway, Light & Power Company, stated that no line or car lightning arresters are used in Portland, Ore. In reply to an inquiry as to how often the inspection of lightning arrester equipment should be made, Mr. Blair pointed out that, in addition to the periodical tests, there should be a general inspection after each electrical storm. Replying to an inquiry as to whether the work of this committee would be continued, Mr. Crecelius explained that, although the work of the committee on lightning protection was at an end, the equipment, power distribution and other committees would carry on the work in a general way.

STANDARDS

The report of the committee on standards was then abstracted by W. G. Gove, superintendent of equipment Brooklyn Rapid Transit System, who pointed out that this report was submitted as a first draft which would doubtless be improved in the course of adapting it to general needs. He explained the need of standards in line with those which had been approved by other engineering organizations that have already devoted considerable study to similar subjects. Mr. Crecelius warmly commended the work of the committee on standards, whose report was then adopted with a vote of thanks. An abstract of the report follows:

The Engineering Association committee on standards reported that in addition to its work of approving the standards and recommendations of the standing committees it had investigated the extent to which association standards and recommendations are being used and had drafted a style for the make-up of specifications. The results of the canvass to determine the extent to which the standards are being used was not satisfactory and another canvass was considered necessary. Regulations governing the style of specifications were proposed, and it was stated that the association's recommended specifications on splice bars for girder and high T-rails and for the manufacture of open-hearth girder and high T-ralls were in general constructed in accord-

ance with these regulations. Appended to the proposed regulations was a list of standard abbreviations, symbols, etc.

The committee recommended for adoption as a standard a design for a spectacle for left-hand, upper-quadrant, 90-deg. semaphore signals, for which a drawing was given.

In general the committee indorsed the recommendations of the several standing committees as covered in their respective reports. The following items covered the most important independent actions of the committee. The standards committee recommend that the specifications for concrete poles be incorporated in the Engineering Manual; that the standardization rules of the A. I. E. E. be given further study, as they have been revised since being considered by the committee; that the standard clearance diagram for semaphore signals be referred back to the committee on block signals for joint consideration with the committee on heavy electric traction; that the boiler code of the A. S. M. E. be referred back to the committee on power generation for further consideration; that the general specification and form of contract for railway structures be disapproved as not suitable for adoption as a standard or a recommendation; that action on type "C" track construction will be withheld until after the convention; that the proposed classification of soils be not adopted as recommended practice but that it be inserted in the manual under "Miscellaneous Methods and Practices"; that the change of the title "Recommended Symbols for Recording Surveys" to "Conventional Signs for Recording Surveys" and the adoption of the signs used by the Interstate Commerce Commission with modifications superseding the present recommendation be disapproved and that the matter be referred to the executive committee for consideration jointly with other committees in order that all symbols may be included in the revision; that the recommended design of rolled-steel wheels of 2½-in. tread and 21-in. to 37-in. diameter be referred back to the committee on equipment for consideration in conjunction with the design of contour of tread and flange, and for further study as to the thickness of rims.

The above report was signed by H. H. Adams, chairman; Martin Schreiber, vice-chairman; C. F. Bedwell, C. H. Clark, W. G. Gove, J. H. Hanna, E. R. Hill, E. B. Katté, C. S. Kimball, F. R. Phillips, A. S. Richey, W. H. Sawyer and J. W. Welsh.

POWER DISTRIBUTION

The Engineering Association committee on power distribution then reported on the following: Concrete poles, tubular steel poles, specifications for overhead line material, overhead crossings of electric light and power lines, standard stranding cable, rubber-insulated wire and cable for power distribution purposes, A. I. E. E. standardization rules, clearance diagram for semaphore signals, joint use of wood poles and suggestions for succeeding committees.

On the subject of concrete poles it was stated that poles had been made according to the committee's designs during the past year and tested at Rochester, N. Y. The results of the tests showed that in general the theory previously presented was correct, but that the constants involved in the formulas would need to be modified. The data of the tests were given in an appendix and a revised specification was presented. An article by C. L. Cadle on "The Method of Manufacturing Concrete Poles in Rochester, N. Y.," was also given in an appendix. As a result of the tests and the experience of the committee the following facts were recorded: Failure of a pole is always due to stretching of the reinforcing rods on the tension side. A failure

is always preceded by the appearance of hair-line cracks in the concrete on the tension side at rather frequent and regular intervals from the ground line up. It is advantageous to use a high grade of reinforcing steel to secure the maximum tensile strength. Plain round reinforcing rods are essentially as satisfactory as twisted or other rough rods because in general the rods will elongate before they slip in the concrete. A larger number of small rods is preferable to a smaller number of large rods on account of the better distribution of reinforcement that may be secured for a given amount of steel and because a greater bonding contact surface is presented to the concrete. The reinforcement need not be uniform throughout the length of the pole, but may be cut off as the top of the pole is approached. A pole with uniform reinforcement will break at the ground line, while one with tapered reinforcement will break off at some point above the ground, depending upon the taper of the reinforcement. A concrete pole has an element of safety in it, as a failure of the pole will not in general allow it to fall to the ground. It is difficult at times to pull over a pole after failure, even though it is inclined at a large angle from the vertical. The committee reported progress only but recommended as follows: That the investigation of the subject of concrete poles be continued; that the material in the report be accepted as a statement of the best practice known to the committee at this time, and that the formulas and tables of the deflections for a square, uniform-section pole presented in previous reports be considered as tentative only and not as final values.

Under the head of tubular steel poles the committee recommended certain modifications of the specifications, the computed deflections, and the pipe tables.

The changes in the specifications recommended were for the purposes of requiring a ground sleeve unless otherwise specified, permitting cold as well as hot swaging of joints, making the detail of joint construction specification more specific, providing for the painting of poles before loading for shipment as general practice, and making more specific the directions for making the deflection tests.

The committee also recommended the substitution of new pole and pipe tables for those previously printed in the Engineering Manual. The pole table gave data for poles in common use, and the pipe table listed thicknesses and weights of pipe which have now been agreed upon by pipe manufacturers. It was stated also that the modulus of elasticity of steel for pole purposes is now well settled at 29,000,000 and this value has been used in computing the deflection given in the pole table. A derivation of cantilever formula more complete than that given on page 13, of the pamphlet *Ds 3a* of the Manual was offered, as the older one applied strictly only to poles of uniform diameter. A set of curves was also given to show graphically the results of calculation by means of the committee's new formula and those used by two manufacturers.

The committee presented a set of specifications for overhead line material which represented results of detailed study of current practice and requirements in this line. These included fifty-five articles and covered general requirements, iron and steel fittings and wood cross-arms, all being illustrated, where possible, with dimension drawings accompanied by tables of tolerances.

In regard to revision of existing specifications the power distribution committee recommended certain revisions of sections 81 and 82 of the recommended specifications for overhead trolley construction in order to meet objections which have been raised and to conform with the ideas of the special committee on lightning protection, the report which is abstracted elsewhere in

this issue. A number of other changes in this specification were also made with a view to providing a greater exactness.

The committee's report contained also brief references to the following matters: A statement of the formation of the national joint committee on overhead and underground line construction, with the circumstances leading up to it, was given. A statement was made to the effect that the committee had not approved certain changes in the standard stranding table recommended by the A. I. E. E., and that the president of the Engineering Association has appointed C. L. Cadle and W. W. Brown to represent the association in connection with further consideration of the subject by the subcommittee on stranding of the standards committee of the A. I. E. E., the standards committee having stated that it would recommend the amended table for tentative adoption pending ratification by several associations. It was explained that certain suggestions in regard to the standard specifications for rubber-insulated wire and cable had been received from W. A. Del Mar, chairman of the committee on wire and cable specifications of the Association of Railway Electrical Engineers, but that these had been received too late for action by the present committee.

There was only one comment made by the committee on the A. I. E. E. standardization rules, namely, that it was desirable to point out a definite dividing line between the transmission system, the substation and the distribution system as defined by rules 388, 389 and 390. A brief report was made of the results of conferences with other committees on the subject of a clearance diagram for semaphore signals, as a result of which it was agreed that the committee on block signals should submit this year a revised clearance diagram with certain agreed recommendations. The recommendation was made that the portion of the report of the committee on joint use of poles, comprising the specifications and drawings, be reprinted as a part of the Manual, together with the exact wording of the action of the American Association with regard thereto. The following subjects were suggested for reference to succeeding committees: Further consideration of the subject of concrete poles, including deflection formulas and tables for tapered sections; further specifications for overhead

line material including especially a standard thread for pins and insulators and a specification for structural steel cross-arms and fittings; consideration of the use of aluminum cable with specifications; collection of data preparatory to possible standard specifications for high-voltage direct-current and alternating-current overhead construction.

The report was signed by A. S. Richey, chairman; G. W. Palmer, Jr., vice-chairman; E. J. Blair, C. L. Cadle, D. E. Crouse, Charles Rufus Harte, R. H. Rice, Gaylord Thompson, and C. F. Woods.

In discussing this report S. L. Foster, Chief Electrician United Railroads of San Francisco, pointed out a number of details in the specifications for overhead line construction in which the recommendations were not in accord with San Francisco practice. In most cases which he cited the San Francisco standards called for heavier construction. For example, anchor rods were upset at the ends so that the diameter at the base of the thread would equal the full diameter of the rod, $\frac{3}{4}$ -in. bolts were used in several places where the specifications called for $\frac{5}{8}$ -in. bolts, and iron plates 18 in. square were used instead of wooden dead men. Replying to Mr. Foster's comments, Mr. Harte pointed out that, in preparing these specifications the committee had attempted to select that form of construction which seemed the most agreeable compromise of the standards approved by the various organizations that were interested.

Mr. Crecelius explained that it was not the desire that the committee compile a set of standards which represented the highest degree of perfection yet attained in this construction lest in so doing many companies would seem to be following bad practice. Although one set of standards could not be expected adequately to meet local requirements in all parts of the country, yet it was very desirable that specifications of some form be adopted as standard. There would be two advantages in this, first, it would be in a measure a helpful guide when public utility companies find themselves still more generally under the scrutiny and regulation of public service commissions, and second, it would make for better prices from manufacturers. The action of the committee on standards on each of the eight specific recommendations in the report was then approved by the convention.

Tuesday Afternoon Session

On Tuesday the Engineering Association held a joint session with the Transportation & Traffic Association, at which the subject of block signals was taken up. This is reported under the proceedings of the Transportation & Traffic Association:

EQUIPMENT

After adjournment of the joint meeting the regular sessions of the Engineering Association were continued, and W. G. Gove, Brooklyn Rapid Transit System, presented the report of the committee on equipment. He read also two letters which had been received recently by the committee objecting to certain clauses in the recommendations regarding the specifications for quenched-and-tempered steel axles and for case-hardened gears.

These were the only criticisms that were received. In regard to the former, this subject had received very careful attention by the entire committee, but if the objection was valid it could be incorporated later. The same is true also of the latter subject, and the committee wished it understood that in such a rapidly-developing science changes would necessarily have to be

made from time to time. An abstract of the report follows:

The committee on equipment of the Engineering Association presented revised standard specifications for heat-treated and annealed carbon-steel axles, shafts and similar parts, the proposed changes being material in character and the titles being changed to read "Specifications for Quenched-and-Tempered Carbon-Steel Axles, Shafts and Similar Forgings" and "Annealed Carbon-Steel Axles, Shafts and Similar Forgings." In this connection it was stated that certain manufacturing interests have claimed that the minimum requirement of 22 per cent elongation and 45 per cent reduction in area are too severe, requiring drastic treatment. However, the committee has been unable to find any conclusive evidence to this effect and is content that the above minimum requirements are proper and entirely reasonable.

The committee submitted as an appendix to the report a statement on the subject of proof-testing forgings to determine their soundness after being quenched and tempered. This included drawings to show the method of applying the test and a design

for a gage to determine the set after testing. A table of the various heights of the drop to be used with different sized axles was also included. The appendix was submitted as a general guide for the members of the association.

The report included a statement from the sub-committee on flexible stranding which had acted with the stranding committee of the A. I. E. E. In this statement the abandonment of the term "extra flexible" was recommended so that, at least for the present, there would be only one degree of flexibility above the present A. I. E. E. standard—this new grade to be known as "flexible." A table of the new grades of flexible cables was appended to the report in order to ascertain whether it met with general approval.

Specifications for gears and pinions were submitted in full in the report, two classes of material, namely, case-hardened and forged carbon steel being covered, as these were the grades in most general use. The specifications, both for gears and for pinions, have been made as broad as possible in order not to impose any unnecessary hardship upon the manufacturer, as it is recognized that a rapid development in gear and pinion treatment is going on at the present time.

With regard to the new design of journal brass for heavy electric traction the committee stated that the numerous details involved in the consideration of this subject make it impossible for the committee entirely to complete its investigation and to make a definite recommendation for the present year. However, a great deal of work has been accomplished which will be of value in the future consideration of the subject, and it is recommended that this be continued for investigation by the ensuing committee.

With regard to the long-standing subject of wires and cables for power equipment with special reference to fire protection the committee submitted as an appendix to its report a revision of the code rules on car wiring, the committee having been informally advised by representatives of the electrical committee of the National Fire Protection Association that that organization would immediately promulgate these proposed rules if approved by the American Electric Railway Engineering Association.

A revision for the specifications for air-brake hose which was presented in the report involves changes in several minor details such as the use of three-ply instead of four-ply hose for the $\frac{3}{4}$ -in. size and the use of $\frac{3}{4}$ -in. in place of the $\frac{7}{8}$ -in. size wherever this appears. With regard to the design of the limit of wear gage for wheels the committee stated that it has considered various types, including the limit gage recently adopted by the Central Electrical Railway Association. Up to the present time, however, the committee has not been able to design a satisfactory form of gage that will be generally acceptable and it is recommended, therefore, that this subject be continued for investigation by the ensuing committee.

In connection with the revision of steel-wheel designs the committee submitted sheets covering detailed dimensions of rolled steel wheels with diameters of 21 in. to 37 in., inclusive, for adoption as recommended design. A study of this matter has developed the fact that there is considerable dissatisfaction with the present standard design of tread and flange contour, and inquiry has brought the information that the contour of flange shown on the association's standard drawings is used only to a small extent. The wheel designs, therefore, carry the present tread and flange contour and are arranged to fit the present standard axle, but the committee recommends that the ensuing committee on equipment be instructed to investigate

and report on the advisability of a change in the standard tread and flange contour, this being particularly desirable in view of the action of the Central Electric Railway Association in adopting a standard contour of its own which is different from that of the Engineering Association's standard design.

The report covered also a review of the standards contained in the Manual, in which it was recommended that the standard brakeshoe be revised because of the fact that the line of pressure of the brake head on the shoe is not properly located and produces uneven wear. The standard for height of platforms for city cars was recommended for elimination. The recent development in small-sized motors necessitates that the design of axle for such motors be standardized and it was recommended that this subject be referred to the ensuing committee. With regard to the standardization rules of the A. I. E. E. the committee recommended that they be referred to the association for approval in so far as they affect the scope of the committee on equipment.

Action was taken by the committee on standards regarding the various recommendations of the committee on equipment as follows: Revision of specifications for quenched-and-tempered carbon-steel axles, shafts and similar forgings approved as a standard; revision of specifications for annealed carbon-steel axle shafts and similar forgings approved as standard; specifications for case-hardened forged-steel gears and pinions and for quenched-and-tempered forged carbon-steel gears and pinions approved as a recommended specification; revision of specification for air-brake hose approved as a recommended specification; dimensions of rolled-steel wheels of $2\frac{1}{2}$ -in. tread and from 21 in. to 31 in. in diameter referred back to the committee for consideration in connection with the design of contour of tread and flange and further study as to thickness of rim, the same action being taken with regard to the standard design for 3-in. and $3\frac{1}{2}$ -in. treads; revision of tread and flange contours referred back to the committee for further study; the proposed rules for car wiring and the report on proof-testing of forgings approved for inclusion in the Manual; elimination of standard height of platform for city cars now shown in Manual approved; standardization rules of A. I. E. E. referred back for further consideration in view of the fact that they have been further revised by the A. I. E. E. since their consideration by the committee.

The report of the committee on equipment was signed by W. G. Gove, chairman; W. E. Johnson, W. W. Brown, R. H. Dalglish, F. W. Garrett, F. R. Phillips, R. M. Hemming and L. N. Clark.

BUILDINGS AND STRUCTURES

The committee on buildings and structures then made its report. General specifications and form of contract for railway structures, provision for expansion and contraction in restrained concrete structures, fire protection rules and the design of a standard fireproof substation building of 1000-kw. capacity were the subjects presented. The form of general specifications and contracts submitted by the 1914 committee were revised somewhat, the "Agreement" portion being greatly shortened. Certain other changes were made in the form to protect the owner in case of action for damages. This revised form was submitted for adoption as a recommended specification, but was disapproved by the standards committee, inasmuch as it was thought that the specification and form of contract were not suitable for adoption as a standard.

Provisions for expansion and contraction in restrained

concrete structures of both the plain and reinforced type were submitted for discussion and an expression of opinion from the convention as to what special features would be desirable for future study. Numerous examples of methods of providing for expansion and contraction were illustrated in the report, particular attention being given to illustrate the methods used for various portions of restrained and unrestrained structures. Rules for fire protection were again considered by this year's committee and the general fire rules as presented at the 1914 convention were recommended to the committee on standards for their approval. Fire protection rules as relating to heating apparatus were also presented by this year's committee. Both sets of rules were approved by the standards committee.

The report was signed by C. F. Bedwell, chairman; R. C. Bird, L. C. Datz, J. H. Frank, F. H. Miller, William Roberts, H. G. Salisbury, Terrence Scullin and H. G. Throop.

The recommendations of the committee on standards on this report were then read and approved. E. J. Blair, Chicago Elevated Railways, spoke of one refer-

ence in the report of the committee on buildings and structures to the proposed safety rules of the Bureau of Standards at Washington, and urged members of the association to communicate any suggestions they might have to A. S. Richey, chairman of the committee on power distribution. C. W. Stocks, statistician American Electric Railway Association, explained that the committee in charge of these rules had held a meeting in Washington on Sept. 29-30, and expected to hold another in New York on Oct. 6, at which representatives of the bureau would be present. He explained he had copies of the rules at convention hall for the inspection of anyone.

H. J. Kennedy, San Francisco, in commenting on the report on buildings and structures, criticised the proposed design of substation as being cramped, and Charles Rufus Harte, the Connecticut Company, agreed with him. In reply Mr. Stocks said he understood the design to be that of an actual substation.

A vote of thanks was then passed to the committees on equipment and on buildings and structures for the comprehensive reports they had presented.

Wednesday Afternoon Session

At the Wednesday afternoon session of the Engineering Association, following the joint session with the Accountants' Association which is reported as a part of that association's proceedings, the secretary read the report of the committee appointed to recommend the previously-mentioned changes in the constitution and by-laws, which was then adopted. The report of the committee on power generation was abstracted by the secretary, this being given in part in the following paragraphs:

POWER GENERATION

In its report to the Engineering Association the committee on power generation departed from its custom for several years past of presenting individual papers. The committee aimed instead to make specific recommendations regarding practices and standards, and in consequence, submitted an analysis of steam-power station costs, which elaborated the standard classification of accounts of the Interstate Commerce Commission in so far as this applied to the cost of manufacture of steam power. The I. C. C. classification numbers, 45-47, 50, and 52-56 were used as a basis, all definitions appearing in the I. C. C. classification applying under the subdivision classifications, but the I. C. C. numbers had added to them sub-numbers, according to the Dewey decimal system. The matters of engineering and operating data records and of the information that should be recorded on various blanks and forms were also discussed, together with the details of cost records covering the operation of any particular power plant.

The committee submitted as a proposed standard for the association specifications for lap-welded and seamless boiler tubes, and these were approved by the Association's standards committee. Specifications for the purchase of fuel were also outlined, these being in the form of a contract made out in blank for furnishing coal to an electric railway company. The purchase of power station lubricants by specifications was discussed at length, several existing specifications being cited and analyzed. It was considered, however, that a rigid specification, covering the physical and chemical characteristics of lubricants is inadmissible at the present time, and only a tentative form of specification was presented.

The standardization rules of the American Insti-

tute of Electrical Engineers were then taken up by the committee. Owing to the somewhat radical changes relating to the ratings of apparatus, a matter which affects all purchasers of electrical machinery, it was recommended that the rules should be submitted for the consideration of the members of the association, rather than by the members of the committee alone. In connection with this suggestion, however, the committee on standards recommended that the subject be given further consideration in view of the fact that the rules have been further revised by the A. I. E. E. since their consideration by the power generation committee.

As appendices to the report there were submitted a method of analysis of steam power station costs which included a standard set of charts to illustrate the variable factors entering into the final result, and also a method for determining standard values for B.t.u., ash, and sulphur in coal that is used for fuel.

The report was signed by J. W. Welsh, chairman; R. J. S. Piggot, A. B. Stitzer, E. D. Smith, W. H. Roberts, G. H. Kelsay, E. H. Scofield and Fay Woodmansee.

Following the presentation of the report there was read a written communication upon it from E. H. Scofield, engineer power and equipment, Twin City Rapid Transit Company. He suggested that since the report was prepared as a basis upon which to make further investigation of the subject, it would be highly desirable for five or six separate plants to arrange to exchange data. This could then be gone over collectively for the purpose of formulating a plan for carrying out plant analyses which would be generally acceptable as a standard. In commenting on the great detail of the report E. J. Blair, electrical engineer Metropolitan West Side Elevated Railway, Chicago, thought that care must be taken to avoid too great detail in analyses of this sort lest the system become unduly complicated. Charles R. Harte, construction engineer Connecticut Company, agreed in general with this view but pointed out that while the refinements need not be followed by the smaller companies it would, nevertheless, be desirable to specify the lines which the more minute analyses should follow in order to render comparable the records of plants where minutæ were important. In reply to an inquiry as to the basis of comparison that had been found most suitable for oil and coal fuels it was suggested that the number of

British thermal units per kilowatt-hour would be most convenient, although the method of burning the oil would be found to influence results. Formal action was taken by the Engineering Association on two specific recommendations of the power generation committee, namely, that which prescribed specifications for lap welded and seamless boiler tubes, this being adopted as a standard specification; and that which

prescribed specifications for the purchase of fuel, this being accepted for publication in the Engineering Manual. In commenting upon the adoption of the report as a whole, the chairman pointed out that the secretary had received a surprising number of requests for boiler-tube specifications and stated that he believed the work of the committee would be very generally useful to member companies.

Thursday Afternoon Session

On Thursday afternoon the report of the committee on way matters was presented before the Engineering Association. In this it was stated that failure to secure the approval of the committee on standards for the four recommended types of track foundation submitted at the 1914 convention had made further consideration of this subject necessary.

WAY MATTERS

The recommendations of the committee were based upon the consensus of opinion of track engineers as obtained through communications. Through the courtesy of the engineering department of the United Railways & Electric Company of Baltimore, Md., the committee obtained an analysis of the track construction used in forty-one cities, nearly all of which had a population of more than 100,000. An analysis of these data resulted in the following percentages on a mileage basis for the types of construction submitted in the 1914 way committee report:

Type 2	23 per cent.	1,718.1 miles
Type 3	2 per cent.	142.5 miles
Type 4	47 per cent.	3,415.9 miles
Type 5	21 per cent.	1,531.4 miles
Type 6	3 per cent.	253.9 miles
Modification Types 3 and 4	4 per cent.	278.8 miles

An analysis on the basis of preferences gave the following percentages:

Plain ballasted construction	62 per cent
Solid concrete construction	21 per cent
Concrete slab sub-ballast construction	5 per cent

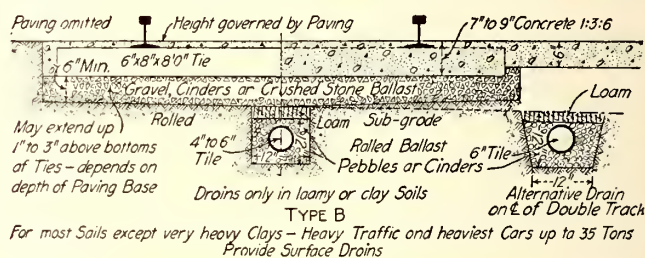

Additional information concerning bearing power and classification of soils was included in this year's report. Attention was directed to the great variety of designs in track construction for paved streets now in use. In an appendix a number of typical designs were presented for the purpose of record. Based upon an analysis of the information available, the committee recommended the elimination of Type D, or solid-concrete track construction, substituting therefor Type C, or the concrete slab sub-ballast construction. The committee also recommended the elimination of Type A because it was special. It was also the opinion of the committee that the proper classification of soils found in average city streets was desirable, and that way engineers should make an analysis of the soils before deciding what was the proper type of foundation to be used.

Two types of track foundations were submitted for adoption as recommended designs, Type B construction submitted in the 1914 report with slight modifications, and Type C as submitted in the same report. The Type C, or the concrete slab sub-ballasted construction was recommended for conditions of soil that required a form of construction that would distribute the load over the sub-soil more effectively than the ballasted construction. Of the two types of track foundation that were thus recommended the committee on standards adopted Type B or the ballasted construction, and withheld its

approval of Type C until this type of construction had been discussed by the delegates at the convention.

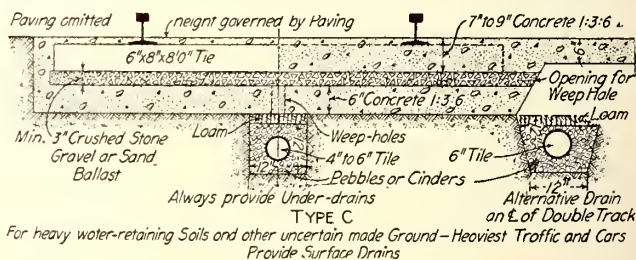

PAVEMENT

The selection of the proper pavement in the track allowance, the committee believed, was one of purely local character and in most instances as local as individual streets. It was consequently recommended that each installation be investigated carefully. The conditions to be considered should include the vehicular traffic, the car traffic, the grade and crown of street the

TRACK CONSTRUCTION FOR GENERAL USE

class of property adjacent, the ability of the company to afford the best material, the type of rail, and the proximity and cost of material. It was the consensus of opinion of the committee that the unit type of pavement was superior to the monolithic or sheet pavement and, based upon the relative usefulness of various kinds of paving in the track allowance, pavement materials

TRACK CONSTRUCTION FOR UNSTABLE SOILS AND UNDER HEAVIEST TRAFFIC

were graded as follows: Granite block, Medina sandstone block, treated wood block, brick, scoria block, asphalt block, sheet asphalt, bitulithic, bituminous macadam, sandstone block and water-bound macadam. No attempt was made to grade concrete pavement, because the committee believed that it had been in use so short a time that little was known of its utility.

The study of pavements and pavement materials led the committee to draw the following conclusions: "Too much stress cannot be laid on the methods of installation of any paving because so much of the wear and life of paving depends on its proper installation, and after installation its inspection and maintenance." For the consideration of future committees it was recommended that a specification be formulated to cover the manufacture and installation of various types of paving

which may be used in connection with the car tracks. Such a specification should include the proper foundation, type of filler and cushion.

Acting upon the recommendation of the 1914 committee, this year's committee took traffic counts in seven cities: Chicago, Cincinnati, Washington, Brooklyn, Syracuse, Montreal and Anderson, Ind. In the opinion of the committee these counts indicated that the form submitted in the 1914 report did not answer entirely the requirements of taking traffic counts from the street-railway standpoint. Accordingly a new form was recommended. The committee was also of the opinion that the principal item of interest to street railway engineers was the proportion of traffic which the track space bears to the remainder of the roadway. The traffic counts indicated that there was no definite relation between the width of roadway, kind or condition of pavement, class of vehicular traffic and kind of rail. It was noted, however, that a smaller percentage of traffic used the track allowance on the wide roadways than on the narrow ones. It appeared that habit had more bearing on the use of the track space by vehicular traffic than any other cause. The committee concluded that traffic counts, to be of any value in the selection of pavement, should be carried over a series of years during the life of the pavement, a record being made during the original construction of the sub-soil, drainage, kind of paving, foundation, foundation of the track, kind of rail, the manner in which the paving was laid, quality of the material, the vehicle and car traffic, the habit of the vehicles in keeping in the roadway or track space, the kind and quality of the paving material, the subsequent rate of wear, if possible to obtain, and the points where deterioration occurs and its causes. A general summary of the traffic counts taken in tabulated form accompanied the report.

SPECIAL WORK SPECIFICATIONS

The way committee, co-operating with a committee representing a number of the important special-work manufacturers, presented general specifications for three types of special work, namely, solid manganese-steel construction, cast steel with hard center and rolled rail arms, iron bound with hard center. It was also recommended that this subject be continued, and that standard specifications for the types of special work not covered, as well as several important matters in connection with standard layouts, be considered by future committees. These specifications were recommended for adoption and were approved for insertion in the Manual by the standards committee.

The revision of recommended designs of 7-in. and 9-in. joint plates with special reference to sizes of bolt holes and fits was considered in detail, and the committee was unable to secure tests from which definite conclusions could be drawn. It, therefore, recommended the continuance of the subject. It also considered the question of joints for plain girder rails and submitted recommended designs for 7-in. 80-lb. and 7-in. 91-lb. plain girder rails. These were approved by the standards committee.

RECOMMENDED CHANGES IN THE MANUAL

This year's committee reviewed the existing standards and recommendations contained in the Manual. It was the committee's opinion that the symbols for recording surveys as shown in the Manual were too small to be of practical use and it recommended as a substitute the conventional signs for recording surveys adopted by the American Railway Engineering Association and the Interstate Commerce Commission, with such modifications and additions, however, as were necessary to

make them apply to electric street and interurban railways. The standards committee disapproved the recommendations of the way committee that these symbols be adopted as recommended practice, and referred the entire subject to the executive committee for consideration jointly with other committees so that all symbols could be included in the revision. Other important revisions in the Manual included the withdrawal of the designs for standard section rails as shown in the Manual and the substitution therefor of 80-lb., 90-lb. and 100-lb. standard sections. The 7-in., 100-lb. plain girder rail was withdrawn as a recommended design because there had been no demand for it. The 7-in. 91-lb. plain girder rail, which was very widely used, was substituted for this heavier section.

The committee recommended the 80-lb., 90-lb. and 100-lb. per yard, standard-section rail for general track construction on private right-of-way and for streets where the type of pavement permitted. For track construction for light service in connection with deep-block pavement, a 7-in. plain girder rail weighing 80-lb. per yard was recommended, and in similar construction but for heavy service the 7-in., 91-lb. per yard plain girder rail was recommended. For track construction for heavy service in connection with deep-block pavement in congested sections of narrow city streets where the vehicular traffic was largely confined to the pavement in the track allowance, the committee recommended the association's standard grooved girder rails. All of the recommendations of the committee for revisions in the Manual as regards plain and grooved girder rails were approved by the standards committee.

The report was signed by C. S. Kimball, chairman; E. H. Berry, R. C. Cram, C. W. Gennet, Jr., W. F. Graves, E. M. Haas, H. F. Merker, L. A. Mitchell and E. P. Roundey.

Following presentation of the report W. D. Chamberlain, assistant engineer United Railroads of San Francisco, said that his company had had very good results from the Trilby type of rail. They were using one weighing 106 lb. per yard.

A. E. Harvey, chief engineer Metropolitan Street Railway, Kansas City, said that the type of construction used in Kansas City was almost identical with that recommended by the committee. He considered the matter of drainage very important, and spoke in favor of the use of brick as a pavement because it was very simple to repair. He doubted the advisability of including the composition for special work in specifications. The proposed specifications included not only the required composition but told what the material must do, and if the desired results are obtained the composition is unimportant. He doubted whether the design for the joint plate shown with the 7-in. rail would stand the strain where high-grade bolts were used. Finally he made a strong plea for standardization in special work, and said that his company had recently had occasion to ask for bids and found a great difference in prices quoted for special work for the first casting and for succeeding castings. With standardization a saving of from 16 per cent to 25 per cent might be obtained.

B. P. Legare, chief engineer maintenance of way and construction United Railroads of San Francisco, described the track construction used in that city. Drains are used only in certain localities. Good results have not been obtained with brick, probably because a good quality of brick was difficult to obtain in the Pacific States. He considered a 9-in. rail better than a 7-in. rail because two lines of bolts could be used.

Edward M. Boggs, consulting engineer, Oakland, Cal., strongly indorsed the use of drains, which he believed to be almost as important as the rails themselves. Sometimes when the water has a flow of marked direction a

drain is advisable outside the track on the uphill side, but usually the drains should be under the center of each track rather than one put between the tracks. In any soil except sandy soils money for drains is well spent.

E. J. McIlraith, Seattle, Wash., said in that city the railway company had adopted as standard a solid concrete construction without crushed stone. It appealed to them because, with a cushion of sand or with ballast, vibration could not be prevented and the ties would begin to pump. The company had experienced no difficulty in providing time for the setting of the concrete on the street and rerouted the cars or used temporary crossings. He recommended that greater care should be taken to line up and smooth the under surfaces of the special work. Generally the upper surface was carefully prepared, but little attention was given to the under surface.

E. B. Entwisle, chief engineer Lorain Steel Company, referred to some slight changes which he would like to suggest in specifications for special work. These were in the size of the test piece and in the time of its heat treatment as the specifications required a heat treatment with the special-work casting. He also strongly indorsed the statement of Mr. Harvey in regard to standardization and said that each section of rail required for the special work some forty different types of patterns, which the manufacturers not only had to make but had to store until they were used. Mr. Chamberlain said that San Francisco practice indicated a 7-in. rail to be generally unsatisfactory. In one instance a 7-in. 106-lb. rail with eight bolts in a single line at each joint had been laid adjacent to 9-in., 137-lb. rails with twelve 1-in. bolts. The latter required no repairs after several years, although it had been necessary to repair the joints in the 7-in. rails.

In closing the discussion on the paper, Charles H. Clark, engineer maintenance of way Cleveland Railway, said that 1½-in. plates on 7-in. rails would not buckle and would doubtless eliminate much joint trouble on such construction. He pointed out that a 7-in. rail is really stronger than a 9-in. rail because of the greater overturning moment of the latter. Wood pavements had been made standard in Cleveland, he said, because they had been found to outlast brick pavements three to one. Five-and-one-half-inch granite paving blocks are large enough for all depths of pavement and smaller blocks are now being recommended by some manufacturers.

He agreed with Mr. Harvey that it is not feasible to specify what the manufacturer shall put into the rails if the strength tests are also specified. Switches and mates can and should be standardized. The cost of white-oak ties in Cleveland is 83 cents against \$1.62 for steel ties, but the latter have been adopted for standard construction. Construction costs have been materially reduced by the use of the steel tie because less work is required in track laying. Although he admitted that a drain under the center of the track was desirable, Mr. Clark had found that trouble was often experienced as a result of the failure to replace such drains when sewer laterals were connected with trunk lines in the street center. He therefore recommended that track drains be placed under the center of the street where they were less likely to be disturbed by conduits of various kinds.

The action of the committee on standards in approving as recommended design the several recommendations of the committee on way matters was unanimously sanctioned by convention action. In addition to the various recommendations appearing in the preliminary printed list, still another recommending the adoption

of specifications for special work was approved by the association as a recommended specification and ordered included in the official report.

WOOD PRESERVATION ON ELECTRIC RAILWAYS

In a paper presented by Carlile P. Winslow and Clyde H. Teesdale before the American Electric Railway Engineering Association the authors discussed at length the present situation in regard to the preservation of wood throughout the country in general and outlined the factors that were involved in the technical aspect of wood preservation, paying special attention to the annual costs of treated and untreated timber for various uses. Examples of the method of working out the annual charges on ties for use on interurban lines and for use in tracks laid on paved and unpaved streets were cited to explain the methods commonly used in arriving at these charges, but it was shown that comparatively little data regarding the life of both treated and untreated ties were as yet available.

In general the authors considered that the life of an untreated tie in a paved street would vary somewhere between ten years and twenty years, and owing to the high cost of replacement, the life was a serious matter. With treated ties, however, a life of between twenty years and thirty years was a reasonable assumption, and that possibly even a life of forty years, or twice the life of the rail, might be attained.

The saving involved by the application of preservative treatment to poles was also briefly considered, this being stated to give the largest comparative economy. The authors considered that the brush treatment would add at least three years to the life of the pole and that the open-tank treatment would add ten years and possibly more. On this basis the latter process would involve a saving of from 20 cents to 30 cents per pole per year.

As a summary in conclusion the authors stated that track in paved streets appeared to offer the widest proportionate field for the application of a preservative treatment to ties, owing to the heavy expenses involved by renewal. With the exception of poles to be used in inaccessible localities, the use of treated poles was generally recommended, even a two-coat brush treatment generally producing economy. The lack of published authentic data covering the life of various species, both treated and untreated, in the various conditions to which the woods are subjected by the electric railway companies, permits of no accurate determination of the economic aspect in the use of treated material. In consequence the authors recommended a systematic collection, compilation and analysis of the results obtained for the various companies throughout the country, and suggested action to this effect on the part of the American Electric Railway Association.

HEAVY ELECTRIC TRACTION

The several recommendations of the committee on heavy electric traction were approved as recommended by the committee on standards after the presentation of this report and the report as a whole was adopted, the thanks of the association being extended to the committee for its diligent work. This report is abstracted below:

The committee on heavy electric traction of the Engineering Association submitted in its report a minor revision in the standard diagram for clearance lines for third-rail working conductors, and also submitted a standard definition for third-rail gage whereby this is described as the distance measured parallel to plane of top of both running rails between gage of nearest

running rail and inside gage line of third-rail. The committee recommended two designs for use in connection with third-rail protection, one of which is the over-running third-rail protection used by the Pennsylvania Railroad and the other being the under-running rail protection of the New York Central Railroad.

The committee also presented a compilation of data on general types of electric locomotives. An analysis of the tables submitted with this indicates that of the total of 301 domestic locomotives listed, 38 per cent are used in connection with 600-volt d.c. third-rail operations, the remaining 62 per cent being used in connection with some form of overhead trolley. Of the locomotives using overhead contact 72 per cent are operated in connection with a.c. systems.

The practice of using forced ventilation was stated to be becoming quite general, especially where a.c. or high-voltage d.c. equipments are used, a distinct weight and cost economy resulting which more than justifies the provision and maintenance of the blowing apparatus.

A great divergence appears in practice in the design of the mechanical parts of the locomotives, especially in the wheel and arrangement and the method of drive. For high-speed operation leading and trailing wheels are provided on the majority of the roads. In some cases, even where the speeds are low but where the line contains numerous curves, it has been thought advisable to provide trucks to prevent oscillation and excessive side pressure. The majority of foreign locomotives use two-wheel trucks. However, the latest type of New York Central locomotive has the guiding truck equipped with motors.

Four methods of drive are cited: (1) Motors mounted rigidly on the axles, a design which makes it obviously impossible to carry the motor on springs. (2) Motors geared to the axles either directly or through quills and driving springs, a scheme that provides practically no flexibility transversely although the motors may be spring mounted. (3) Motors geared to jackshafts which are in turn connected with the driving wheels by means of side rods, this scheme providing spring support for the motors with the maximum amount of flexibility and freedom of movement that exists with steam locomotives. (4) Motors connected to jackshafts by means of main rods, and drivers connected to jackshafts by means of side rods, a plan which has the same flexibility of mounting as the previous case but which has been used in this country only for the high speed service of the Pennsylvania terminal in New York.

It is the opinion of those who use motors located on or near the axles that the high center of gravity which is claimed to produce improved riding qualities is not necessary to give good riding qualities provided that the running gear is so designed as to avoid setting up of an oscillatory tendency.

An interesting feature of electric locomotive practice is the fact that the weight for driving axle ranges from 30,000 lb. to 55,000 lb.—considerably less than the axle weight used for steam locomotives, which ranges from 40,000 lb. to 68,000 lb. Another important feature of the mechanical design of electric locomotives is the short rigid wheelbase which ranges from 6 ft. 6 in. to 13 ft. for domestic locomotives. Also, as the source of the power for the operation of electric locomotives is not on the locomotive itself, but is in the power house, it is feasible to construct electric locomotives with almost unlimited power or capacity by providing a sufficient number of driving axles and motors.

In conclusion it may be said that electric locomotives have been built and operated to perform every kind of railroad service in excess of the maximum capacity for

which steam locomotives have been built for similar service. It is, however, too early to attempt to standardize electric locomotives either electrically or mechanically. The report was signed by E. R. Hill, chairman; C. H. Quinn, J. M. Bosenbury, W. S. Murray, Hugh Hazleton and E. B. Katté.

ELECTROLYSIS

The report of the committee on electrolysis was then presented by E. J. Blair, electrical engineer Metropolitan West Side Elevated Railroad Company, Chicago, who explained that the committee had consulted with and assisted the national joint committee on this subject and was now awaiting the further action of that body. The report of the national joint committee would pave the way for further action on the part of the Engineering Association's electrolysis committee whose continuation be recommended. The last-named committee reported that it had been represented by E. J. Blair on a special committee on lightning protection which had agreed to certain limitations as to allowable current flow over a lightning arrester ground connection joining track and ground. Thus, as the committee on electrolysis believes that no appreciable harm can result to foreign sub-surface structures with the current specified (0.25 amp., average), it has at least tentatively approved the proposition of the special committee.

In explanation of the position taken by the electrolysis committee, it may be said that the committee was principally concerned in the matter of grounding lightning arresters, and has heretofore been opposed to the grounding of the same arrester to both earth and track rails, on account of the feeling that the use of the proposed plan might add to the current on sub-surface structures. Other committees, however, such as those on power distribution and equipment, have favored the connection of line lightning arresters to both an earth ground and the track rail on account of the more efficient protection which might be secured thereby.

The committee also called attention to a typographical error in the pipe resistance tables as printed in connection with the report appearing on page 379 of the 1913 *Proceedings*. In the lower, right-hand corner of the pages 138, 136 and 146 should read respectively 13.9, 13.9 and 14.8. The report was signed by A. S. Richey, chairman; E. J. Blair, E. B. Katté and G. W. Palmer, Jr.

After discussion in which H. P. Bell, C. R. Phenecie and S. L. Foster participated the report of the committee on electrolysis was accepted.

NEW OFFICERS

C. H. Clark then presented the report of the nominating committee, in accordance with which officers were elected as follows: President, John Lindall, superintendent rolling stock and shops Boston Elevated Railway Company, Boston, Mass.; first vice-president, F. R. Phillips, superintendent of equipment Pittsburgh Railways Company, Pittsburgh, Pa.; second vice-president, G. W. Palmer, Jr., electrical engineer Bay State Street Railway Company, Boston, Mass.; third vice-president, W. G. Gove, superintendent of equipment Brooklyn Rapid Transit System, Brooklyn, N. Y.; secretary-treasurer, E. B. Burritt, New York. Members of the executive committee in addition to the officers were elected as follows: E. R. Hill, consulting engineer Norfolk & Western Railway, New York; C. S. Kimball, engineer maintenance of way Washington Railway & Electric Company, Washington, D. C.; C. L. Cadle, electrical engineer New York State Railways, Rochester, N. Y., and C. F. Bedwell, assistant engineer Public Service Railway Company, Newark, N. J.

Transportation and Traffic Meetings

Committee Reports on Rules, Schedules, Block Signals, Accident Prevention by Motion Pictures, Freight and Passenger Traffic, Handling Fares and Training Employees Were Among the Matters Discussed During the Convention of the Transportation & Traffic Association

Program for Monday

Annual Address of the President.
Annual Report of Executive Committee.
Annual Report of Secretary-Treasurer.
Reports of Committees:
Rules—W. H. Collins, chairman.
Construction of Schedules and Timetables—Alexander Jackson, chairman.
Definitions—H. C. Donecker, chairman.
Transportation—Accounting—Co-chairman: J. K. Choate and M. R. Boylan.

Program for Tuesday

Reports of Committees:
Block Signals for Electric Railways—J. M. Waldron, chairman.
Joint Sub-committee on Block Signal Rules—L. H. Palmer, chairman.
Transportation—Engineering—Co-chairmen: R. N. Hemming and P. N. Jones.
Address—"Relation of Electric Railways to Agriculture." Paul Shoup.
Report of Committee:
Standards—L. H. Palmer, chairman.

M. C. BRUSH
President

Program for Wednesday

Reports of Committees:

Claims-Transportation—Co-chairmen: R. P. Stevens and B. B. Davis.
Freight and Express Traffic—F. D. Norviel, chairman.
Passenger Traffic—P. P. Crafts, chairman.

Program for Thursday

Reports of Committees:

Fares and Transfers—J. E. Duffy, chairman.
Training of Transportation Employees—C. S. Ching, chairman.
General Business.
Reports of Convention Committees:
(a) Resolutions.
(b) Nominations.
Election and Installation of Officers.

Monday Afternoon Session

THE sessions of the American Electric Railway Transportation & Traffic Association convention in San Francisco began on Monday, Oct. 4, 1915, President M. C. Brush calling the meeting to order at 2 p. m., and presenting the annual presidential address. In this he said in part:

"The organization of the committee on standards is one of the most important steps which the Transportation & Traffic Association has taken since its organization. This committee has before it the work of standardizing the methods and practices now in vogue in the transportation and traffic end of the industry, and there can be no doubt but that, as time progresses, the results of this committee's work will be of increasing value. An important function of this committee is to encourage the use of correct methods and to bring these out into definite shape as standards for the guidance of the industry. Briefly stated, the purposes of this committee are: (1) The handling of standards and recommended methods and practices. (2) The consideration of reports of committees prior to their printing for presentation to the convention. (3) The compilation and editing of the transportation manual and the syllabus of proceedings.

"Another departure this year is the formation of a joint committee with the Claims Association. This committee has conducted an interesting investigation on the use of moving pictures. In view of the wonderful development of the moving-picture art, the recommendations brought out by the committee are particularly timely. The committee urges that the investigation be continued next year.

"The committee on training of transportation employees has done an important work in the compilation of State laws on various subjects which are now on file in our office for the benefit of member companies. Its recommendations as to a program for improving courtesy on the part of trainmen, on certain questions of discipline and on watch inspection methods will, doubt-

less, meet with the approval generally of those in charge of our companies.

"The committee on rules has done some valuable work. It is interesting to note that the number of our member companies who are not using the standard codes is but a very small percentage of the whole. The joint sub-committee on block-signal rules has made notable progress in the preparation of the block-signal code, covering all types of signals.

"The committee on passenger traffic presents some interesting data in connection with the subject of one-man car operation. In its investigation of the effect of privately-owned automobiles on interurban and suburban roads the committee was unable to obtain any specific results, as the companies generally have made no systematic study of this question. It would seem desirable that next year's committee be instructed to continue this study.

"The report of the committee on fares and transfers shows that companies generally are giving little thought to any improvement in the methods of issuing transfers. The committee presents an interesting study on fare collection on center-entrance cars and includes an instructive comparison of various prepayment methods. It also makes some timely comment on the use of fare boxes.

"The work of *Aera* deserves hearty support from all hands. I urge a more general contribution to the Question Box. This is a valuable feature of the magazine which should be made use of consistently.

"There is before the Transportation & Traffic Association for action a proposed amendment to the constitution to provide for a new class of individual members consisting of company section members. I desire to emphasize the importance of the change in the constitution and urge its adoption. The marked success of several companies in creating company sections is of decided interest, and I cannot too strongly urge other companies to follow the examples already set."

Secretary Burritt then read his annual report, showing an existing membership of 634 enrolled in the Transportation & Traffic Association.

The report of the committee on rules was read by W. H. Collins, Fonda, Johnstown & Gloversville Railroad, this being given in abstract in the following paragraphs.

RULES

The committee on rules of the Transportation & Traffic Association recommended that the following rule and note concerning the display of markers be substituted for present rule 104 covering rear-end signals: "The following signals will be displayed, one on each side of the rear of the train and as markers to indicate the rear of the train: By day, green (or yellow) flags or marker lamps not lighted; by night, green (or yellow) to the front and sides and red lights to the rear except when the train is clear of the main track, when green (or yellow) lights must be displayed to the front, side and rear: Note: It is recommended that on roads where one-car trains are operated no markers be used by day."

The committee recommended again to the convention the rules for classification signals, which were submitted by the 1914 committee, as a substitute for the present rules 105, 106 and 107. The changes consisted in the use of flags in addition to lights at night and their location at the middle of the front end of the train instead of at the height of the markers.

With regard to the investigation of the flagging rule in accordance with the instructions of the 1914 convention, the committee recommended the following addition to rule 159 after the first sentence: "If unable to get dispatcher where a train register is maintained, the train may proceed on its time-table rights, executing all train orders." The committee is of the opinion that the present rules represent best practice in connection with flagging procedure, and the block signal rule has been changed to agree with this, as shown in the report of the joint committee on block signals.

In accordance with the resolutions passed by the executive committee at its meeting on Oct. 12, 1914, the committee on rules is now in a position to pass upon any question of train-order interpretation submitted to it through the secretary of the association. One such question of interpretation has been acted upon and the matter has been referred to the executive committee for its approval.

The committee also renewed the recommendation made before the 1913 convention with reference to rule 113 of the interurban code. This covers the present slow-speed signal, which consists of a yellow flag by day and a yellow light by night placed beside the track to indicate that the track is in condition for speed not to exceed a limited number of miles per hour. The proposed rule plans for the addition of a green flag and green light on the same side of the track to indicate that normal speed may be resumed, the objection to the old rule being that the use of yellow for two indications, first as a caution signal and second as a signal to resume normal speed convey conflicting information and on double tracks might not be observed because the present signals are placed on opposite sides of the track.

An appendix to the report provides a joint index which shows by numbers the rules of the two codes, city and interurban, which are either similar or in a general way cover related subjects. This permits the combining of the two codes.

The report was signed by W. H. Collins, chairman; L. H. Palmer, vice-chairman; Edward Dana, W. R. W. Griffin, Sam W. Greenland, C. E. Morgan and W. C. Callaghan.

Referring to proposed rule 104, and after discussion by H. A. Nicholl, Union Traction Company of Indiana, and L. H. Bradley, Stone & Webster Management Association, the rule was adopted after elimination of the words "or yellow" appearing in parenthesis. The note under rule 104 was omitted. After discussion the three proposed revisions of the rules for classification signals were approved except for the elimination in each of the words "at the middle," these applying to the location of the signal on the front end of the train. The association then adopted the code of rules as standard with the amendments as made at the San Francisco convention.

Following this the report of the committee on schedules and time-tables was presented in abstract by the secretary. This report, after considerable discussion on the subject of near-side stops, skip stops, elimination of time points and traffic counts, was accepted as a progress report with instructions to the incoming executive committee to continue a committee on this subject. An abstract of the report follows:

SCHEDULES AND TIME-TABLES

The report of the committee on construction of schedules and time-tables before the Transportation & Traffic Association took up in detail a number of subjects of special importance at this time. A résumé of the practice in telephone train dispatching on four different city railways was submitted in tabular form, together with an outline of the method of operation which involved no unusual features. All of the companies believed in the advisability of using private branch telephones in connection with the telephone dispatching system, claiming that the private phone is serviceable in cases of emergency when the regular dispatching phone between termini is not available. The advantages of the telephone dispatching system over schedule operation were said to be that constant supervision is obtained over all the lines at all times, that a record is available of the location of all cars operated all day, and that an uneven headway is quickly noted, making it possible to space cars better under extraordinary conditions. In addition, two of the companies claim decreases of 50 per cent and 66 per cent respectively in the force of street inspectors. However, the committee did not feel justified in making any recommendation on the telephone dispatching system at the present time and believed that the subject deserved further consideration.

The report contained also a remarkably clear and concise description of a method for taking, recording and filing traffic data obtained from traffic counts. This covered the use of observers, known as car timers, who are stationed along the line at the points of maximum load, transfer points to other lines, points of divergence and terminals, and they record the car number, time of arrival and load for each car as it passes. Every line is covered at least once in two weeks and the large trunk lines at least once a week. Charts are prepared from the data thus obtained. Another method of developing traffic data was cited in connection with the preparation of "distribution charts," similar to the diagrams that have heretofore been referred to as "characteristic curves" in the ELECTRIC RAILWAY JOURNAL. According to the committee, these, when properly taken and recorded, allow a much deeper study into the elements which govern traffic. In their preparation two observers may be placed on each car, one at the front platform and the other at the rear. At each stop throughout a trip each observer records the street, the time and the number of passengers boarding and leaving. One of the observers is supplied with a stop watch and with this he records the length of stop in seconds. Each trip is then charted graphically. This chart has the length of the

trip in miles, to scale, as a base, and as a vertical scale shows the passengers boarding and leaving. A continuous algebraic sum of the boarding and leaving passengers can be developed to give a load line, and the stopwatch record can be developed to show the average length of stops and the average passenger interchange. The committee considered that charts of this type are invaluable.

Possibly the most important subject discussed in the report was that of the influence of stops on schedule speed. As a result of several thousand observations taken on representative city lines of one railway system, the average stop was found to be seven seconds in length, and this value was used in connection with other data in compiling a set of curves to indicate the relation between the number of stops per mile, the speed of the car and the time required to cover the distance between stops. In preparing these curves the time required for covering different distances was noted, from which the speed between stops was computed and plotted against the distance between stops, as was the time consumed between stops. Then using the average length per stop of seven seconds, and adding to this the time

B and C the respective dimensions were 12½ in. and 17 in. and 14½ in. and 17¾ in.

The times per single passenger are as follows:

Type A	3.23 seconds per passenger
Type B	2.68 seconds per passenger
Type C	1.59 seconds per passenger

When movements that take place without a full stop of the car are excluded, these values compare as follows:

Type A	3.23 seconds per passenger
Type B	2.68 seconds per passenger
Type C	2.19 seconds per passenger

The average time per passenger when the loads of all sizes are considered is approximately the same in all cases, varying less than 10 per cent between type A and type C. Of course, as the number of passengers per movement increases, the advantage of the open platform diminishes and the loading time approaches closely the values obtained with inclosed platforms.

The committee also submitted data covering fully-vestibuled cars and prepayment cars, these being based on replies to a letter sent to 148 railways. They showed that 80 per cent of the companies used fully-vestibuled cars and that 12 per cent did not use them, 8 per cent

RELATION BETWEEN STOPS PER MILE SCHEDULE SPEED AND OTHER FACTORS

consumed between two consecutive stops, the speed was computed for this time and distance, and as before, plotted against the distance between stops.

In the accompanying chart, curve No. 1 represents the number of stops per mile in relation to the distances between stops. Curves Nos. 2 and 3 indicate the time required to run between stops, No. 3 including the average stop of seven seconds. Curves No. 4 and No. 5 show the speed in miles per hour as calculated from the time shown by curves No. 2 and No. 3 and the distances involved.

The committee took up also the effect of fully vestibuled platform prepayment type cars on scheduled speed, accidents, etc., and presented data obtained from observations timed from the instant that the car came to rest until the car started, regardless of incidental delays of passengers in boarding. For each type of car about 2000 passengers were timed as they were boarding. The accompanying curves show the accumulated average boarding time per passenger on cars with three different types of platform. The curve A represents the time for fully-inclosed cars; curve B for cars with inclosed platform but equipped with gates instead of doors, and curve C for cars with open platforms and without gates or doors. A supplementary curve is made for type C from which are excluded observations of all movements during which a full stop was not made. The three cars had available rear platform standing spaces of respectively 26 sq. ft., 28 sq. ft. and 27 sq. ft. In type A the height from street to step was 14½ in. and from the step to the platform 17 in., while for types

AVERAGE BOARDING TIME PER PASSENGER ON OPEN AND CLOSED-PLATFORM CARS

failing to reply. Fifty-seven per cent of the companies operated prepayment cars and 31 per cent did not, 12 per cent failing to reply. Sixteen per cent of the companies reported a decrease in schedule speed from the use of fully-vestibuled cars and 13 per cent reported an increase in schedule speed, 71 per cent reporting no change. These companies commented as follows on the effect of fully-vestibuled cars on accidents: Eighty-eight per cent reported a decrease; 1 per cent reported an increase; 11 per cent reported no change. Of these companies 84 per cent used doors and 16 per cent gates. In this connection 59 per cent of the companies allowed platform riding at any time and 14 per cent allowed it when the cars were full.

Another interesting part of the report was that dealing with near-side stops, in which it was said that eighty-seven companies are now using that method of operation. The reasons given for its adoption varied some being voluntary action of the company, some because of ordinance, some because of commission orders, others on account of agreements with civic organizations. A few companies have used near-side stops but have discontinued the practice. The graph on the next page shows the growth of the use of the near-side stop from 1907 to 1915.

The type of car used by the companies operating with near-side stops varies materially. Only 16 per cent of those reporting use the near-side car, which has exit and entrance on the front platform. The majority of companies are operating end-entrance cars and they are of the opinion that this type is satisfactory, since with

the entrance at the rear and the exit at the front there is the greatest facility for loading and unloading passengers. It is worthy of notice that some companies using the end-entrance cars with the near-side stop report that this tends to increase the proportion of passengers leaving by the front end. With regard to the effect of the near-side stop on operation opinion was about equally divided as to whether the number of stops was decreased or showed no change. The majority reported no change in speed but a material number reported an increase. No change in power consumption was reported by the majority. Most railways reported a decrease in accidents although some stated that there was no change.

The majority of those using the near-side stop favored it, but seven companies were opposed. Only two of the seven gave reasons against it, one being because the end-entrance cars tended to reduce the speed on account of the passengers having to walk to the rear of the car to board it. The second reason was the trouble result-

GROWTH OF THE NEAR-SIDE STOP

ing from motormen fouling crossings because of the unusually slippery rail with which this company has to contend. However, the consensus of opinion was that neither of the above-mentioned objections is borne out.

The most common reason given in favor of the near-side stop is that it tends to reduce the number of accidents. Other reasons are that it reduces the number of stops, increases the speed, saves power and reduces congestion. Two companies state that it is so general that transients naturally wait for a car on the near side of the street. Of the companies reported as not using the near-side stops only a few gave reasons for or against its use, about half of them being in favor of the near-side stop and half of the remainder opposing it on account of paving conditions.

The committee stated that valuable information on the subject of near-side stops would be found in the replies of the companies regarding the matter, and that these data, while too voluminous to be included in the report, are on file in the office of the American Electric Railway Association.

With regard to interurban time-tables the committee stated that the data that it had been able to obtain were rather unsatisfactory. However, the present standard form was not considered suitable for several reasons and the preparation of a suitable standard form was one of the most important things that could come before the time-table committee. Because of the large number of subjects referred to it, the committee had not been able to give the matter the attention it required and recommended its reference to the next year's committee.

The report was signed by Alexander Jackson, chairman; J. J. Dempsey, vice-chairman; J. C. Nelson, H. F. Fritch, G. A. Richardson and C. B. Wells.

In the discussion which followed Joseph V. Sullivan, Chicago Surface Lines, pointed out that his company had obtained data in the study of skip-stop operation that differed somewhat from that printed in the report. About twelve stops per mile was the average in Chicago and the loss in time ranged from eleven seconds to fifteen seconds at each stop. President Brush described the detailed study of schedules and service and how it had affected the Boston Elevated Railway. After a thorough study more seats were furnished economically for people when they wanted to ride. N. W. Bolen, Public Service Railway, described briefly that company's service bureau, which included twenty-two men who were engaged in making studies and plotting charts.

Mr. Bradley said that until two years ago the properties in Texas, when complaints were made, had to reply, "We will investigate." This was not right. They are now keeping accurate records of each and every car and can make quick and definite answers to criticisms of service. Complete knowledge of service conditions was most essential in determining how speed could be increased to meet the jitney competition. Messrs. Bolen and Sullivan expressed the thought that the association should take steps to have a thorough study made of the skip-stop plan.

A. B. Merrihew, Los Angeles Railway Corporation, described experiences with the omission of time points on three complete lines in Los Angeles. Cars are started on schedule time and the men are instructed to make the trip as fast as they can without exceeding the schedule speed of the midnight schedule. It is probable that time points will shortly be dispensed with on all lines. The service, as a result of this new practice, has received many compliments from the passengers, headways have been checked and found, in many cases to have been improved. The old men do not run away from the new men because of the supervision given by the instructors, five of which are riding the cars at all times.

W. E. Harrington, Metropolitan Street Railway, Kansas City, said that the jitneys had reduced that company's earnings \$3,000 a day. This had been counteracted in part by increasing the schedule speed 2 m.p.h., notwithstanding which increase the accidents had been reduced. The severity of jitney competition had diminished.

W. G. Murrin, British Columbia Electric Railway, stated that the jitneys had caused a loss of 40 per cent in the receipts at Vancouver. In order to meet this loss the schedule speed had been increased approximately 12 per cent. However, he felt that unless time points were maintained car loading would be very uneven due to irregularity in headway.

Thomas Fitzgerald, Cincinnati Traction Company, spoke of the good results obtained by omitting time points on a depot line and thus meeting jitney competition to better advantage. Mr. Fitzgerald also discussed the near-side stop, which, at first, had been put in operation all over the Cincinnati property and later had been changed to the far-side stop in the suburbs because of the condition of the streets. The near-side stop had saved considerable power. Mr. Harrington said that the near-side stop in Kansas City had increased the speed and decreased the accidents. This was also the general opinion of several delegates who discussed the value of near-side stops and set forth their local conditions.

UNIFORM DEFINITIONS

The report of the committee appointed to develop new definitions was read by Joseph V. Sullivan, Chicago Surface Lines, and after discussion the association accepted the report, referring it to the incoming

executive committee with the expectation that the work hereafter would be considered as a duty of the American Association so that any definitions formulated would take into account all branches of the industry. The report appears in part below:

The committee of the Transportation & Traffic Association appointed to develop uniform definitions has endeavored this year to make definite progress toward the completion of a code of definitions which might be adopted by the association and put into practical use by its member companies. However, a detailed study has shown that this subject cannot be viewed from the transportation standpoint alone, as a word which has one meaning in one part of the company's organization

is often given a different interpretation by one of its other departments. It is therefore thought that no definite recommendation as to definitions should be submitted to this convention but rather, that the association should urge the appointment of a general committee with several representatives from the American and each of the affiliated associations to take up this whole question.

The report was signed by H. C. Donecker, chairman; Frederic Nicholas and William C. Greenough.

Joseph K. Choate, chairman, then stated that the committee on transportation accounting had no report to make and no action to suggest. Hence the joint session was omitted.

Tuesday Afternoon Session

On Tuesday afternoon the joint meeting of the Engineering Association and Transportation & Traffic Association was held, and the joint report on block signals for electric railways was read in part by W. H. Collins, Fonda, Johnstown & Gloversville Railroad, this report being abstracted in the following paragraphs.

BLOCK SIGNALS

The committee submitted designs for a semaphore signal exclusive of the operating mechanism. These were approved as recommended designs for the association by the standards committee. A standard clearance diagram for semaphore signals, in which the undesirable features of the design presented before last year's convention had been eliminated, was also submitted. This diagram was, however, referred back to the committee by the standards committee for conference with the committee on heavy electric traction.

A complete code of signal rules was included in the report, this revision of the existing code being submitted as a progress report only for the guidance of the member companies. In connection with this the committee recommended that provision should be made for representation on the A. R. A. committee that is at present working on a new code for signal procedure. With regard to the point brought up at last year's convention about Rule No. 10 in the code for contactor signals, which covered procedure in case passage under the contactor failed to set the signal, the committee decided that the rule should be restricted to non-registering signals, thus leaving the procedure in the case of registering signals to be determined by special rules suitable to each particular installation.

A review of the subject of light signals followed in which was cited the use of two lenses, the inner one being colored and the outer one of larger size and of clear glass. The lenses are set about $1\frac{1}{2}$ in. apart and a 25-watt concentrated filament lamp is used, giving an increase of some 33 per cent in range while maintaining the same spread of light found with previous arrangements. Another development is the use of a special compound toric lens using a reflector back of a concentrated filament lamp, the reflector being so placed that phantom indications are impossible. With this arrangement lenses $8\frac{3}{8}$ in. and $10\frac{1}{2}$ in. in diameter have been tried, the lens being designed in some cases to throw a narrow beam of light which can easily be seen in the day-time at a distance of from 3500 ft. to 4000 ft. The beam-light signals recently installed in the electrified zone of the Pennsylvania Railroad near Philadelphia were also mentioned, it being said that the absence of color to intercept the light from this type of signal makes it possible for the

indication to be seen at distances ranging between 3000 ft. to 4000 ft. during the daylight hours.

The committee had been instructed to make a study of signal systems on roads that were signaled from end to end, such study covering maintenance cost, efficiency of operation and effect on traffic. There was found to be a lack of uniformity among different companies in the way in which signal operation data were reported, and this led to the development of a standard signal report form upon which all companies could keep their signal data, with the result that little or no confusion would be found when requests for information were made by succeeding committees. This standard form was submitted with the committee's report, together with a recommendation that it be given a trial. A review of existing standards and recommendations by the committee resulted in a recommendation for but one change, namely, to change the expressions "car counting" and "non-car counting," as applied to contactor signals, to the terms "car registering" and "non-car registering," respectively. The sub-committee having the matter of definition of signal failure under consideration reported progress only as it was found that there was a wide divergence of opinion among operating companies. It was recommended, therefore, that more time be given to the committee for a comprehensive study. The report included also an extensive statement on the subject of highway crossing protection, which has been published in abstract in the *ELECTRIC RAILWAY JOURNAL* for Jan. 23, 1915.

With regard to the operation of single-track lines by signal indication only, the report stated that for high-speed heavy interurban single-track operation with the track protected by automatic block signals having continuous track circuits, the preponderance of evidence obtained from a large number of representative electric and steam railways, indicates that use of dispatchers and time-card rights, augmented by standard train rules, is the most approved practice. However, development of the art may considerably change the present opinion, as in some instances short stretches of lines are now operated by signal indication only and under the partial direction of a train dispatcher. It is the feeling of the committee that experience may prove it feasible to operate trains by signal indication only, under the partial direction of a train dispatcher or other officer used in a supervisory capacity where proper protective train rules are used, provided the railway is equipped with modern automatic signals whose electrical circuits are free from outside interference.

As appendices to the report there were a bibliography on block signals and several brief descriptions of signal installations made during the past year, these in-

cluding an extension of the signaling on the Scranton & Binghamton Railroad which has been operating for more than a year by signal indication only and has found this method of operation highly satisfactory. The replies to the data sheet on signal operation, sent out in January, 1915, are also included in an appendix in tabular form, as are also the replies to the data sheet on highway crossing signal installations. Another appendix contains a blank form for a signal estimate data sheet for a.c. track-circuit signals, this being designed for submission by a railway company to a signal company when it is planning to make a signal installation.

The report was signed by J. M. Waldron, chairman; J. W. Brown, vice-chairman; A. E. Roome, H. A. Nicholl, C. D. Emmons, G. N. Brown, John Leisenring and C. H. Morrison.

After discussion the associations approved the recommendations on standard designs for a semaphore signal. The recommendation for a standard clearance diagram for semaphore signals was, however, referred back to the committee for consideration with the committee on heavy electric traction. Charles Rufus Harte, The Connecticut Company, then spoke of the need for closer co-operation between the steam and electric railways associations so that, wherever conditions permitted, uniform rules might obtain, and in connection with this H. A. Nicholl pointed out that the suggestion contained in the report with regard to co-operation with the A. R. A. had been proposed by Charles H. Morrison of the New Haven Railroad, who was primarily a steam railroad man. The sense of various members who discussed the subject was that continued effort should be made toward joint action with the steam railroad associations for the purpose of further unification of rules and practice. The complete report was then accepted as a progress report, and the wish was voiced by the convention that the recommendations contained in it be brought to the attention of the incoming executive committee.

PAUL SHOUP'S ADDRESS

Following the joint session the Transportation & Traffic Association listened to an address by Paul Shoup, president Pacific Electric Railway Company, Los Angeles, on the relation of electric railways to agriculture. Mr. Shoup said, in part, that it is idealism, as much as desire for financial profit, that has created the communities along the electric lines. Ideals which create agricultural and horticultural development can be gratified in a large degree by the modest many only where the electric railroads operate. He mentioned the great tonnage of agricultural products carried by the Pacific Electric lines, and set forth a typical farmer's day, showing the intimate connection of his life with electric railway service. Speaking of the mutual interdependence of the electric railways and agriculture Mr. Shoup suggested that if the people in general had the correct idea of it the electric railways might get under the same wing of the government with agriculture, and he contrasted the governmental policies toward the railroads and toward agriculture. When the farmer needs help the government supplies it without expense, and the government initiates constructive work to help him. Has the public looked upon transportation as equally essential to its welfare and treated it in the same fashion? The public must learn that the electric railways are business institutions traveling upon the most narrow of business margins. Without the government's active support and sympathy they may in large measure disappear. If the electric railways are impoverished, so will be the communities along their lines.

In conclusion Mr. Shoup suggested that troubles should not be too deeply considered as troubles, but as serious problems to be solved by constructive activity. Such activity should include fair and earnest education of commissions and the public so that the people will hold the same viewpoint as to the value of agriculture and of transportation.

STANDARDS

The new committee on standards of the Transportation & Traffic Association then made its report, submitting a code of procedure for the future work of the committee, this following as closely as possible the practice already in use by the Engineering Association. Progress was reported in the compilation of a syllabus of the Transportation & Traffic Association's proceedings during the current year. The committee approved the inclusion of the city and interurban codes in the Transportation & Traffic Manual as standards of the association. It was impossible at this time to submit any other matters for adoption as standards or recommended methods or practices, but the incoming committee was advised to take up as a part of its work the revision of all recommendations made to date in accordance with the standard routine. The report was signed by L. H. Palmer, chairman; J. N. Shannahan, vice-chairman; C. V. Wood, G. L. Radcliffe, N. W. Bolen, J. E. Gibson, F. D. Norviel, Alexander Jackson, P. P. Crafts, W. H. Collins and C. S. Ching.

The report was read in abstract by J. N. Shannahan, vice-president Newport News & Hampton Railway. After its adoption by the association Mr. Shannahan presented an additional report prepared by the same committee, but dealing with proposed changes in the constitution and by-laws of the Transportation & Traffic Association. In making these suggestions it was pointed out that the committee desired to define more clearly the duties and responsibilities of the officers and committees of the association. No formal recommendations were made because the constitutions and by-laws of the four affiliated associations are modeled upon the by-laws of the parent association, so that the question should be taken up by all of the associations jointly.

The committee recommended, however, that steps be taken to consider the following suggestions: First, that the president have charge of the finances; second, that there be but one vice-president for each of the four affiliated associations; third, that six other members be elected to form the executive committee, which would then consist of nine members; fourth, that the various committees be appointed by the presidents; fifth, that the duties of the vice-president be extended so as to require him to familiarize himself with the personnel of the transportation and traffic department of member companies, to prepare for the last executive committee meeting at the convention a tentative list of recommended committee appointments for the ensuing year and to keep in touch with committee work and follow the general progress made; sixth, that the first meeting of the new executive committee be held within thirty days after the convention.

Concerning the work of the committees of the Transportation & Traffic Association, it was recommended that there be included in the association by-laws provision for standing committees on standard rules, passenger traffic, express and freight traffic, training of transportation employees, and schedules and timetables. Certain other committees should be appointed from time to time to confer with similar bodies from the other associations. The recommendations also included provision for the procedure of the various committees with the purpose of facilitating their work.

In conclusion the committee on standards recommended that its work be continued.

After some discussion on these recommendations a motion was carried authorizing the incoming president

to appoint a committee of three whose duties would be to arrange for the revision of the constitution in accordance with these suggestions, the revisions to go into effect at the next convention.

Wednesday Afternoon Session

At the joint meeting of the Transportation & Traffic and Claims Associations on Wednesday afternoon President Brush of the Transportation & Traffic Association presided, and the report of the joint committee on claims-transportation was read by President Tichenor of the Claims Association.

CLAIMS-TRANSPORTATION

The committee on claims-transportation, formed jointly from the Transportation & Traffic Association and the Claims Association, outlined in its report the result of an investigation of the applicability of motion pictures to safety-first work in its three phases, namely: the training of employees, the education of school children and the education of the general public. From the information thus obtained the following facts were evident: No one who had ever used moving pictures for educational purposes had ever abandoned them; every company that had ever used moving pictures to any extent was extremely enthusiastic as to the results and the desirability of their use; at least twenty-seven films are on the market and these can be readily obtained.

The committee recommends that all companies should use moving pictures in their safety work and that the American Electric Railway Association should establish a central bureau through which moving picture films can be obtained by member companies. The committee also recommends that the executive committee of the American Association should consider the advisability of the association owning a machine and reels which could be rented to members of the association if assurances can be obtained from a sufficient number of companies that the reels will be used. By providing the smaller companies, which cannot afford to make their own reels, with a method by which these can be obtained, a great deal will be accomplished.

The report was signed by R. P. Stevens, chairman; W. F. Weh, J. P. Barnes, A. D. B. Van Zandt, E. E. Slick and B. B. Davis.

In the discussion N. W. Bolen, Public Service Railway of New Jersey, said that that company had presented five reels of motion pictures to its employees with good results and that the local schools had applied for them. Previous to their use the company had used stereopticon slides. Byron Nixon, chief train-service instructor Pacific Electric Railway, Los Angeles, was thoroughly convinced that motion pictures were a most efficient means for instruction and he would like to see the association own a circuit. The great trouble now was that there were not enough reels. It was a mistake to consider the safety feature only. His company uses them in ordinary instruction work and finds them very helpful in teaching the men to be more courteous. Another use is to instruct them in the methods of signal operation, picking up broken trolley wires and the like. He cited examples of how the reels were used for instructing conductors in regard to their duties in different emergencies.

George Carson, Puget Sound Traction, Light & Power Company, spoke about the good results in public schools. B. F. Boynton, claim agent Portland Railway, Light & Power Company, Portland, Ore., also had good results to report. The safety work in Portland is con-

ducted by a public commission appointed by the mayor and representing the different municipal departments and different classes of citizens. J. H. Handlon, claim agent United Railroads of San Francisco, expressed a need for more films. J. V. Sullivan, Chicago Surface Lines, stated his company had been using reels for some years. J. A. Gibson, Metropolitan Street Railway of Kansas City, approved the idea and said that his company has been using the stereopticon in public schools.

Upon motion the association voted to continue the committee and President Brush said that the incoming presidents of the Claims and Transportation & Traffic Associations would consider whether the subject of motion pictures should be taken up only from a safety standpoint by the committee or from other viewpoints as well.

At the close of the joint session the Transportation & Traffic Association took up the subject of the proposed changes in constitution and by-laws which were read and explained by Secretary Burritt and then passed.

F. D. Norviel, chairman of the committee on express and freight traffic, then presented the report of that committee, which is abstracted below:

FREIGHT AND EXPRESS TRAFFIC

The committee on freight and express traffic of the Transportation & Traffic Association discussed at length a number of subjects, its conclusions being based largely upon returns from data sheets. Answers were received from 178 railways—about double the number of replies which were received in previous years. Most of the companies that replied do not handle express, and nine do only a small amount of such business, but fifty lines operate regular express service either on their own part or through old-line express companies, and in many cases both. It was found that practically all of the interurbans in Indiana, Ohio, Michigan and a large portion of Illinois and Pennsylvania, are doing both an interurban and an old-line express business. The larger systems, representing the most mileage, have gone further into the matter of express traffic and have given it greater attention than the smaller lines.

Of the fifty companies doing express business, twenty-one do not have contracts with the old-line express companies. Of the remaining twenty-nine, eight have contracts on a tonnage basis, two on a mileage division, and nineteen on a pro-rate of the through rate. An analysis of the tonnage and revenue taken as a whole from the scattering information received showed very little change in the amount of business in 1914 as compared with 1913. Lines in the Middle West generally show increases, while in other sections they fluctuate with no apparent reason. Only seven of the lines doing an interurban express business have a pick-up and delivery service, and one provides a pick-up service only. Aside from the minimum charge, which in nearly all cases is 25 cents, interurban non-delivery rates follow closely 70 per cent of the old-line express company rates.

Apparently the motor truck has not had an appreciable effect on express traffic. The parcels past, however, has been a prominent factor either in hindering a normal increase, or in causing an actual reduction in the revenues. Estimates as to the effect of the parcel

post range all the way from a reported loss of 50 per cent down to a belief that no injury has been done. The committee, however, believes that the parcel post is a real menace to interurban express, and can suggest only good service as a counteracting influence.

In general the committee considered that contracts with old-line express companies would be beneficial to the traction lines, provided, of course, that contracts are made under favorable conditions. Such service should be augmented by traffic arrangements for an interurban express, or expedited freight, carried on passenger cars, this service being elastic and susceptible of handling with few cumbersome details. Rates for such service should be placed about midway between the highest class freight rates and the merchandise rate of the old-line express companies, with the customary minimum charge.

With regard to handling freight the report gives in detail the information contained in replies from fifty companies which operate a strictly freight traffic. A table showing gross passenger and freight revenues for the railways in a number of different States indicated a decrease from 1913 to 1914 of 0.7 per cent in passenger business, while on freight the earnings were 4.8 per cent greater in 1914. It is a reasonable inference from the figures that there are opportunities in freight traffic for a large increase in the earning capacity of interurban railways, although passenger traffic for the past three years has practically been at a standstill. The committee considered that no such efforts were made to increase freight revenue as to maintain passenger revenues, and that if the same relative expenditure had been made for freight equipment and facilities, and for freight advertising as for passenger traffic, the freight business would show a much larger increase.

The report discussed briefly the subject of interline business, stating that little progress is being made. The committee felt that the interest of the traction lines will be better preserved if affiliations are made in all cases with connecting traction lines rather than with steam railroads. The report also discussed briefly the question of weights, rates and inspection service, reiterating its belief in the advantages of a simple form of weight and class inspection by some organization independent of the railway.

The subject of class rates was then taken up, the committee recommending that no further attempt be made by the electric railroads to secure a uniform rate on a mileage scale until the steam railroads had progressed further along these lines. The matter of franchises was also briefly touched upon, and an outline organization for the freight department was submitted. The report concluded with recommendations for future work of the committee, and included as an appendix the form of data sheet which had been used in securing information by the 1915 committee.

The report was signed by F. D. Norviel, chairman; F. W. Coen, G. H. Harris, H. E. Reynolds, E. T. Chapman and C. F. Handshy.

In the discussion J. K. Choate of the J. G. White Management Association, New York, gave arguments in favor of working through the old line express companies but said that, owing to their average short haul, electric railway companies must be much more careful in looking out for a fair minimum payment than was necessary with steam railroad companies. Mr. Norviel explained that the basis used by his company was a prorate of the regular rate and he thought that this was the best plan. Mr. Choate then brought up the importance of the electric railway companies making arrangements to interchange cars if they expected to do much freight business. H. A. Nicholl, general manager

Indiana Union Traction Company, explained that this was done to a large extent already in the central electric railway territory. His company, for instance, sends through trains over four lines from Indianapolis to St. Joseph, Mich. Through trains are also run from Indianapolis to Dayton, Ohio, and to Fort Wayne, Ind. The Central Electric Railway Association has rules in regard to the interchange of cars not only for freight but also for passenger business.

Mr. Norviel pointed out that, on the fifty roads doing a strictly freight business which replied to the committee, the gain in freight earnings during the past year was 4.8 per cent, while on the passenger business there was a slight decrease. E. H. Hyman, general manager Electrical Package Agency, Cleveland, said that all of his contracts were on the basis of the merchandise rate. Packages weighing less than 100 lb. are the most profitable part of the business. The rates of his company prior to 1914 were the same as the express company's, but since that date the Interstate Commerce Commission reduced the rate charged by the express companies for shipments weighing less than 100 lb. and his company promptly made its rates slightly less than the express company's. His company still has a minimum differential of 3 cents on packages weighing less than 100 lb., but charges the same rate on packages weighing more than 100 lb. He considered the essentials of success as good service, intelligent solicitation, courtesy and prompt payment of claims. Last year the company handled out of Akron \$60,000,000 worth of rubber tires.

Mr. Brush then described the new freight terminal property of the Boston Elevated Railway in which there is an investment of about \$750,000. His company handles the freight cars of the suburban properties on a wheelage basis, the rate being determined by the average number of cars per day per month in accordance with a sliding scale. The privilege of freight car operation over the streets of Boston and some of the suburbs was obtained by application to the Public Service Commission, which over-ruled the refusal of the city authorities to grant that privilege. About thirty cars a day are now operated in and out of the terminal and business is still confined only to the lines extending south from Boston. Mr. Brush did not believe in pickup and delivery service. F. W. Coen, general manager Lake Shore Electric Railway, described the service of the Cleveland package agency which now operates thirty-eight wagons and handles the pickup and delivery business as well as the transportation part of an extensive service over the lines of practically all of the roads centering at Cleveland.

Several members discussed the effect of motor trucks and parcel post service on interurban freight and express service. Mr. Hyman said that at first the parcel post had caused a loss of considerable business but because it had been impossible to obtain settlement of shipment losses and other claims the shippers had instructed their traffic men again to use the express company service. Also a number of motor truck lines which had been started in Cleveland to serve the city and the suburbs had been abandoned.

Charles L. Henry, Indianapolis & Cincinnati Traction Company, thought the receipts of the old line express companies had been decreased by the parcel post, but this had not affected the interurban station delivery business. Years ago, when the old line express service was put on, interurban men feared that it would rob the station delivery business but that has not been the case.

The report of the committee on passenger traffic was then read by J. J. Dempsey, Brooklyn Rapid Transit System, who pointed out that its most important sub-

ject was that of one-man car operation. An abstract is given in the following paragraphs:

PASSENGER TRAFFIC

In its report to the Transportation & Traffic Association the committee on passenger traffic gave the results obtained from replies to a letter requesting information on one-man car operation, to which 171 companies replied. Fifty-four of these companies operate one-man cars, twenty-six using them exclusively and twenty-eight having them in zones of light traffic. One hundred and eight companies are permitted by charter or franchise to operate one-man cars but are not doing so; nine are not permitted to operate one-man cars, one because of a contract with its trainmen, and eight on account of charter or franchise restrictions, extracts of which appear in an appendix to the report.

The exclusive operation of one-man cars appears to be confined to cities averaging 16,000 population, with a maximum of 25,000. Schedule speeds compare favorably with two-man cars operated in similar territory. This comparison, however, does not hold good for zones of heavy traffic. Nearly all companies use the near-side stop. The average passenger revenue per car-mile reported by thirty-five companies is 14.47 cents and the operating expenses per car-mile reported by twenty-eight companies are 12.72 cents. Trainmen's wages per car-mile average 3.22 cents, twenty-five companies reporting them.

Of the fifty-two companies reporting wages paid to trainmen, forty-two have not increased the wages over those paid on two-man cars and ten companies have increased wages as follows: seven companies from 1 cent to 5 cents per hour, one company 10 per cent and one company 20 per cent.

The prepayment method of fare collections is practically universal, most of the companies using fare boxes. About half of the companies issue transfers to passengers when they leave the cars, the other half issue them as they board. Thirty-one companies report fewer accidents and seven report no difference as compared with two-man operation. The general reduction in step accidents, however, is very marked. Twenty-one companies report that one-man car operation does not adversely affect the settlement of accident claims and twenty-eight report that they find nothing to indicate an adverse effect by such operation. No serious difficulty appears in the matter of flagging at railroad crossings, although sufficient time must be allowed in the schedules for the proper performance of that duty.

Of forty companies reporting on the prejudices of the public, twenty-five mention a favorable attitude, seven report no objections, and one reports the public as indifferent. Seven mention opposition by organized labor and other bodies.

Several companies employ additional trainmen during the hours of heavy traffic and on holidays, etc. A few

employ additional trainmen in zones of heavy traffic. Of forty-one companies reporting upon structural changes in cars to adapt them to one-man operation, twenty have remodeled cars already in service, six have built new cars and fifteen have made no changes. In an appendix to the report a description was given of the one-man car developed by the Illinois Traction System, and extracts were made from a paper on one-man car operation that was read before the 1915 meeting of the Wisconsin Electrical Association, matters which have been covered in various issues of the *ELECTRIC RAILWAY JOURNAL*.

With regard to its investigation of the motor bus and the trackless trolley the committee found only one system of the latter type operating in this country, and that there was no foundation for any recommendations to the electric railways that this means of transportation has yet passed the experimental stage. The present status of such motor-bus companies as were in operation in 1914 has changed very little. With regard to the effect of privately-owned automobiles the committee found it impossible to obtain any specific results as determined by studies made by any of the companies that responded to requests for information.

The report was signed by P. P. Crafts, chairman; E. M. Walker, J. K. Punderford, J. A. Greenland, F. W. Hild and E. E. Soules.

Following the presentation of the report several members described the one-man car service operated on their properties. Mr. Nicholl pointed out that particular care must be taken for protection at railway crossings. L. E. Gould, *ELECTRIC RAILWAY JOURNAL*, described the new one-man service recently inaugurated in Spokane with re-built cars under the jurisdiction of R. A. Willson, general superintendent Washington Water Power Company.

W. C. Callaghan, general manager Helena Light & Railway Company, also described successful service with one-man cars. Each trainman was carefully examined before being put in complete charge of a car, and physical examinations were made regularly. Instead of introducing the service quickly the cars were first operated with two men at the front end, and the conductors were gradually removed. The public likes the improved service and it has been in successful operation for two years.

Mr. Coen stated that a law has recently been passed in Ohio relieving the electric railways from the necessity of flagging unused industrial track crossings. J. E. Gibson, general superintendent, Metropolitan Street Railway, Kansas City, had just inaugurated one-man car service on certain owl cars. As soon as this service has been thoroughly tried out it will probably be extended to other schedules. Mr. Callaghan did not favor one-man cars for owl-car service, while other members pointed out that this was a question of the character of traffic.

Thursday Afternoon Session

The report of the committee on fares and transfers which was presented before the association on Thursday afternoon is abstracted in the following paragraphs:

FARES AND TRANSFERS

The investigation, during the past year, of the committee on fares and transfers of the Transportation & Traffic Association indicates that transfer issuing and collecting devices have not been sufficiently tested to warrant conclusions as to their practicability. The report states that no great amount of interest has been

displayed by the electric railways in demanding mechanical methods of issuing transfers, but that there is a need for such a machine. The report also gives an outline of fare-collection methods on center-entrance cars, these being generally similar to other prepayment systems.

The committee reported that the fare box has not fulfilled all that was expected from it. To insure the full return of all fares paid an improvement seems necessary in its construction in order to secure the immediate registration of each fare deposited in a way

that is beyond the control of the conductor to regulate. This feature has been accepted by some manufacturers by the installation of motors in fare boxes in order to accomplish immediate registration. There is no question but that the fare-box system of receipt and accounting for fares has come to stay, and every encouragement should be made to induce manufacturers to meet conditions that fulfill every expectation which was originally thought the fare box, as constructed, would accomplish. A motor-driven fare box (with the elimination of the penny counting mechanism) that will immediately register the fare deposited gives little or no opportunity for conductors to defraud the company, inasmuch as the deposit of a penny would not give him an opportunity to deceive the observer.

The report presented also an outline of the practice of several companies using the prepayment method on lines that had more than one fare zone. One of these makes use of an exchange ticket which is issued to each passenger boarding the cars and which is dropped into a fare box when he leaves. On another a check similar to a transfer is issued to passengers when they pay a 5-cent fare, this being collected from the passenger by the conductor when the car passes the city limits. On two lines the fares outside of the city limits are collected by the conductor as if the car was not of the prepayment type, and on one line the fares outside of the first-fare limits are collected by an inspector who boards the car. Another line makes use of colored exchange tickets that are purchased when the passenger boards the car and which are deposited in a fare box when the passenger leaves.

The report included an explanation of the method of using extra front-end collectors which has been introduced in Toronto, Kansas City and San Francisco, this system being explained in brief as follows: At one or more busy loading centers the street railway company places additional uniformed conductors with portable neck registers. As soon as a prepayment car stops they collect fares and allow passengers to enter at the front as well as at the rear end. This is supposed to facilitate loading and to help the distribution of the passengers throughout the car.

The committee found that there was some difference of opinion as to the time saved by the system and quoted from a letter received from one railway company which said in part: "Checks taken at the outlet of our congested district on days when collectors were engaged, compared with days on which they were withdrawn, revealed to us the fact that the number of cars passing through this zone were identical on the days of the two checks. They also disclosed the fact that the traffic policemen stationed at the intersecting streets had been working up to their limit in moving cars previous to the installation of the front-door loading system, and that the movement of cars was entirely dependent upon them. The object we thought to attain not having been accomplished, we are now contemplating the removal of the extra conductors and a return to the old system."

The Metropolitan Street Railway Company of Kansas City, Mo., has used this method of fare collection since 1911. There are six collectors in the morning and thirty-six in the afternoon rush hours, who are placed at busy transfer points and at some large department stores. They are also used extensively on special occasions, such as ball games during the summer and at theaters in the winter. They handle cash and transfers in the same manner as regular conductors and they also keep trip sheets. One test made by this company at a busy transfer point, with the front-end collectors working, showed that 282 passengers were loaded through

both the rear and front doors in 304 seconds, or one passenger every 1.07 seconds. Of the 282 persons handled 109 were loaded through the front door and 173 by the rear. At another busy transfer point under similar conditions, with only the rear door in use and the front-end collectors eliminated, 105 passengers were loaded in 235 seconds, an average of one passenger every 2.23 seconds.

The United Railroads of San Francisco also has used a similar plan of auxiliary collections for the past two years and reports that this has been successful thus far in enabling the cars to perform a greater service and to handle more people. About twelve collectors are employed at the heavy loading points in various parts of the city.

The committee made no recommendation on the subject and gave the experiences of the companies in the belief that some managers will find the system to facilitate loading, while others would not care to try it because of a difference in traffic conditions.

With regard to the question of zone collection versus through collection on suburban and interurban lines the majority of replies to the committee's questions favored the through method. No suburban roads with fast service collected fares by zones, and the committee recommended the through collection system because it is of less annoyance to passengers and because, with the use of hat checks, there is no reason why conductors should not be able to follow the destination of their passengers. The report was signed by J. E. Duffy, chairman; J. V. Sullivan, vice-chairman; H. T. Jones, B. C. Edgar, C. E. Learned and G. K. Jeffries.

In the discussion of this report, which was read, in the absence of Chairman J. E. Duffy, by J. V. Sullivan of Chicago, H. T. Jones, San Francisco, said that front-end collection is very satisfactory in that city as it helps to get people to the front of the car and evens up the load in the rush hours. J. H. Harvey, Kansas City, also expressed satisfaction with the results of stationing collectors at the front end of cars at congested points in the evening rush.

J. N. Shannahan, Hampton, Va., asked President Brush to describe the work with motor-driven coin boxes in Boston, and calling Mr. Shannahan to the chair, Mr. Brush described in considerable detail the development of the Boston system. This eliminates the use of paper in collecting revenue and has been the subject of several articles in the *ELECTRIC RAILWAY JOURNAL*. The company has, with a very few exceptions, eliminated tickets and, in the collection of 1,016,000 fares from motor-driven boxes, has had a loss of only 35 cents. By Dec. 1 of this year no paper whatsoever will be sold to passengers and deposited in boxes, ticket sellers being replaced by change girls. From 85 per cent to 90 per cent of the passengers have the correct change for their fares. The change girl is given \$50 when she goes to work and all her money transactions with the company are exchanging bills for small coin, so that she always has just \$50. There are never any disputes. Mr. Brush mentioned a method of dumping coin into coal hods and thence into a counting machine, which wraps packages ready to turn over to the bank. The company's establishment of prepayment areas for surface cars with motor-driven coin boxes also has successfully provided for baseball rush traffic. In reply to queries Mr. Brush said the company had had no trouble from small coins and jumping registers. John F. Ohmer, Dayton, Ohio, spoke briefly on the importance of the human element, and T. Fitzgerald, Cincinnati, raised the point that the elimination of the human element in the form of men whom the railways pay and control might well give increased play to the human element in the public.

Upon motion the report was then accepted and the committee was continued.

Following this J. E. Gibson, Kansas City, in the absence of C. S. Ching, chairman, read the report of the committee on training of transportation employees which is abstracted below.

TRAINING TRANSPORTATION EMPLOYEES

The report of the Transportation & Traffic Association committee on training transportation employees stated that, because so many labor laws were in effect at the present time, a compilation of them was impossible but that the bureau of labor statistics at Washington had published a summary of labor laws of the United States with court decisions, under date of Jan. 1, 1914, this being supplemented by a statement dated Jan. 1, 1915.

With regard to the investigation of a systematic program for improving courtesy on the part of trainmen, replies to a data sheet which had been sent to all member companies showed the following conditions as applying to the 155 companies that answered: 55 per cent issue letters or bulletins when an employee is commended for courtesy; 6 per cent issue a company magazine and one railway is contemplating starting a company publication in the near future; 33 per cent issue instructions with regard to courtesy, the majority posting instructions on bulletin boards; 57 per cent hold meetings where the subject of courtesy is discussed, several of these having regular semi-monthly or monthly meetings.

Although the replies indicate that no systematic scheme for improving courtesy had been adopted the committee considered that it was a most important matter and advocated personal contact between the officials and employees with that end in view. It is always advantageous to have employees properly informed regarding issues between the company and its patrons and especially so when such matters are given publicity in the newspapers. It should not be necessary also to wait until a letter of commendation is received or some meritorious act is performed before speaking to an employee in regard to the good service he has rendered. Much good can be accomplished by informing those who have made exceptionally good records that they are performing their work in a satisfactory manner and that this service is appreciated by the company.

With regard to the discipline of new men the replies to the data sheet show that 24 per cent of the 155 companies have a probation period ranging from ten days to six months. In seven cases the instruction of new men is solely in the hands of the instruction department, and where such practice is followed it is reported to have produced good results. On large properties, especially on compact city systems having a centrally located instruction department, there is no doubt but that the instruction department can materially assist in keeping the discipline of new men uniform. Frequently, better results can be obtained by returning men to the instruction school for further instructions rather than by administering discipline, as in the case of older men in the service. There should be a period during which discipline should be of an instructive and corrective nature, and the follow-up system for new men should be systematic. There should be a man whose duty it is to ride with new employees and he should be held responsible for their proper instruction. On large systems this can be best accomplished through an instruction department, segregated from the regular departments of the division.

With regard to watch inspection methods the committee found that ten member companies required a

standard watch having from seven to seventeen jewels, seven of the roads requiring seventeen jewels. Sixteen other roads have a watch inspection. The committee felt that it was necessary that some system of checking watches should be maintained, but it did not seem feasible for all roads to require a high standard of watch with a periodical inspection system. The minimum requirement should be the provision of standard clocks installed at every rating station where men report and that the trainmen be required to have reliable watches and to compare time with the rating station clock before taking out runs. The report was signed by C. S. Ching, chairman; W. J. Harvie, Bruce Cameron, E. E. Strong and F. I. Hardy.

This report was discussed by Mr. Gibson, Oscar Keesee, Manila; H. A. Nicholl, Anderson, Ind.; A. B. Merrihew, Los Angeles, and J. J. Dempsey, Brooklyn. Mr. Nicholl found that instruction through the safety committee and particularly by semi-annual banquets was very helpful. Mr. Merrihew described his company's work in replacing punitive by educational discipline, this having been referred to in a special article in the *ELECTRIC RAILWAY JOURNAL*. Mr. Dempsey thought that 90 per cent of the instruction is wasted unless followed by examination. His company examines its employees every three months, and if a man is deficient he is sent back to school.

MISCELLANEOUS BUSINESS AND ELECTION OF OFFICERS

Under the head of general business, L. C. Bradley, Houston, Tex., introduced a resolution similar to the one passed by the Claims Association which was, in effect, an expression of opinion of the Transportation & Traffic Association to the American Association that, in view of the congestion, delay and economic loss resulting from the immense increase of automobile traffic in city streets, the various States of the Union should, by uniform legislation as far as possible, define the rights and duties governing motor vehicles in the use of the streets in cities and towns, and that those vehicles travelling on the larger streets, and streets upon which street railway tracks are laid, should have a right superior to those vehicles proceeding from smaller or less-travelled streets.

J. N. Shannahan then read the report of the nominating committee by the adoption of which the association elected the following officers: President, H. A. Nicholl, general manager Union Traction Company of Indiana, Anderson, Ind.; first vice-president, L. C. Bradley, assistant district manager Stone & Webster, Houston, Tex.; second vice-president, R. E. Danforth, general manager Public Service Railway Company, Newark, N. J.; third vice-president, W. H. Collins, general manager Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y.; secretary, E. B. Burritt, New York.

The new executive committee is composed of the officers and J. J. Dempsey, superintendent of transportation Brooklyn Rapid Transit Company, Brooklyn, N. Y.; L. H. Palmer, United Railways & Electric Company, Baltimore, Md.; W. G. Murrin, general superintendent British Columbia Electric Railway Company, Vancouver, B. C.; R. P. Stevens, president Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.

After installation of the newly elected officers, J. K. Choate, New York, read the report of the committee on resolutions conveying thanks to the San Francisco residents for the welcome and the entertainment extended the association on the Pacific Coast, to those who made the preliminary convention arrangements, to President Brush, the officers and committee members of the past year, and to the manufacturers association.

Other Features of the Convention

Preliminary Report of Claims Association Meetings—Outline of Convention Entertainment—Account of Exercises at Exposition Grounds—List of New Officers and Executive Committee Members of Manufacturers' Association — Addresses at Spokane and Portland.

BELOW are published a brief résumé of the American Electric Railway Claims Association meetings and accounts of events of general interest, including addresses delivered at important cities en route to the convention.

CLAIMS ASSOCIATION

The first meeting of the Claims Association was called on the afternoon of Monday, Oct. 4, by President William Tichenor, claim agent Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind. His presidential address will, in accordance with the customary practice of this paper, be published in the issue of Oct. 16, together with abstracts of the papers presented before this and the following meetings. After the annual reports of the executive committee and the secretary-treasurer, reports were presented by the committee on an accident prevention board, the committee on employment and the committee on ways and means. The scheduled paper on "The Prevention of Motor Vehicle Accidents" by S. B. Hare, claim agent Altoona & Logan Valley Electric Railway, Altoona, Pa., was read by H. D. Briggs, assistant general claim agent Public Service Railway, Newark, N. J. In the general discussion following the reading of this paper, Russell A. Sears, general attorney Boston (Mass.) Elevated Railway, spoke about a law recently passed in Massachusetts on the subject of automobiles. He promised to send a copy thereof to Secretary Burritt.

At the meeting of the association on Tuesday afternoon the paper on "Standardization of Claims Statistics" by E. E. Slick, claim adjuster Union Traction Company of Indiana, Anderson, Ind., caused a discussion in which many participated. The scheduled joint meeting with the Accountants' Association was not held, as President Tichenor announced that the joint committee on claims-accounting had been instructed to continue its work and to present a complete report at the next annual convention.

The work of the Claims Association on Wednesday afternoon began with a joint session with the Transportation & Traffic Association, at which the joint report on claims-transportation was submitted. This report is covered in the proceedings of the latter association. After this joint session the Claims Association delegates listened to a paper on "A Card Index and What It Means" by J. J. Reynolds, claims attorney Boston (Mass.) Elevated Railway.

At the final session on Thursday afternoon a paper on "Safety and Its Relation to Conservation" was presented by B. F. Boynton, claim agent Portland Railway, Light & Power Company, Portland, Ore., after which written discussion was read as follows: "Financial Benefits Resulting from the Safety First Movement" by J. S. Harrison, claim agent Jacksonville (Fla.) Traction Company; "Justification of the Safety First Movement from a Humanitarian Standpoint" by Alves Dixon, claim agent El Paso (Tex.) Electric Railway; "Uses and Benefits of Illustrated Lectures" by H. K. Bennett, claim agent Fitchburg & Leominster Street Railway, Fitchburg, Mass.; "Should a Moving Picture

Film Exchange Be Established by the A. E. R. A.?" by F. J. Warnock, chief claim agent Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.

At the conclusion of the discussion the committee on resolutions submitted its resolutions of thanks to the various individuals and organizations, and the following officers were then elected: President, George Carson, claim agent Puget Sound Traction, Light & Power Company, Seattle, Wash.; first vice-president, R. E. McDougall, claim agent New York State Railways, Rochester, N. Y.; second vice-president, S. B. Hare, claim agent Altoona & Logan Valley Electric Railway, Altoona, Pa.; third vice-president, B. F. Boynton, claim agent Portland Railway, Light & Power Company, Portland, Ore.; secretary-treasurer, B. B. Davis, claim adjuster The Columbus Railway, Power & Light Company, Columbus, Ohio. Executive committee members were chosen as follows: J. J. Reynolds, claims attorney Boston (Mass.) Elevated Railway; P. C. Nickel, claim agent New York (N. Y.) Railways; J. H. Handlon, claim agent United Railroads of San Francisco, San Francisco, Cal., and Alves Dixon, claim agent El Paso (Tex.) Electric Railway.

According to precedent, an engraved and dated gold badge was presented to the retiring president, Mr. Tichenor.

COMMEMORATIVE MEDAL PRESENTATION

On Friday morning the delegates met at Native Sons' Hall and were taken to the exposition in special buses. After a photograph had been taken they marched to the Court of Abundance, where Charles N. Black, as master of ceremonies, introduced Thornwell Mulally of the exposition board of directors. In presenting commemorative medals to the American and Manufacturers' Associations Mr. Mulally stated that little is said nowadays in praise of street railway companies, but in reality transportation is the business upon which all other businesses depend. It takes civilization into the far corners of the earth, and without it the development of new territory is impossible. San Francisco, he said, was literally paralyzed after the fire during the period when the street car system was wholly out of commission, and it came to life again promptly when the service was resumed.

President C. L. Henry received the medal for the American Association. In expressing appreciation of such a token he said that San Francisco and the exposition had made such a deep and favorable impression on all that he was sure each individual who came West to the convention would carry away pleasant memories that would never be forgotten. The Manufacturers' Association medal was received and acknowledged by Charles C. Peirce. In expressing the thanks of the Manufacturers' Association Mr. Pierce pointed out that that body was making every effort to support the operating end of the industry. He outlined the natural divisions of the electric railway field, and indicated how well the executive, operating and manufacturing phases of the industry could work together for the benefit of all.

Mr. McGraw then presented his address on the original development and progress of the electric railway, abstracted elsewhere in this issue. After the commemorative exercises the entire party boarded a special boat for luncheon and an afternoon's excursion across the bay. At Oakland automobiles were in waiting to take the visitors on a sight-seeing trip, ending in time for an early evening return to San Francisco.

SOCIAL SIDE OF THE CONVENTION

The great attraction at San Francisco outside of the convention was, of course, the Panama-Pacific International Exposition and, as the illumination of the buildings at night was an important feature of the exposition, the entertainment committee arranged for only one evening function downtown. This was the annual reception and ball, which was held in the Colonial ballroom of the St. Francis Hotel on Monday evening. It was very largely attended and the dancing continued until after midnight.

The other evening entertainment was a highly enjoyable trip to the exposition grounds on Wednesday evening. This was personally conducted by W. D'A. Ryan, who had charge of the arrangement and installation of the illumination system. Many of the delegates dined first at Old Faithful Inn. The party was then taken by Fadgl auto-trains to the "Marina," where they viewed a special display of fire-works and a scintillator drill. Then after a tour of the grounds by train they were taken through the various courts by Mr. Ryan.

The golf tournament took place at the grounds of the Claremont Country Club in Oakland on Thursday. There was no special entertainment on Tuesday or Thursday evenings except the dinner mentioned below.

On Thursday evening retiring President Allen of the American Association and retiring President Baker of the Manufacturers' Association gave a dinner in honor of the new officers of all the associations. W. D'A. Ryan was also present, and about twenty-two retiring and newly-elected officers and others attended.

MANUFACTURERS' ASSOCIATION

About 100 representatives and delegates attended the annual meeting of the American Electric Railway Manufacturers' Association, held on Wednesday, Oct. 6, 1915, with President E. H. Baker in the chair. Secretary-Treasurer H. G. McConaughy presented his reports, and the following members were elected to the executive committee to serve three years, the first three to succeed themselves: Charles C. Peirce, General Electric Company, Boston, Mass.; Henry C. Evans, Lorain Steel Company, New York, N. Y.; Daniel W. Smith, Peter Smith Heater Company, Detroit, Mich.; Miles B. Lambert, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., and A. H. Woodward, International Register Company, Chicago, Ill.

At the meeting of the executive committee of the Manufacturers' Association, held on Oct. 7, the following were elected to take office on the retirement of the present officers in December: President, Thomas Finigan, vice-president, Pierson Roeding & Company, San Francisco, Cal.; vice-president in charge of relations, Charles C. Peirce, manager railway department General Electric Company, Boston, Mass.; vice-president in charge of finance, L. E. Gould, western manager ELECTRIC RAILWAY JOURNAL, Chicago, Ill.; vice-president in charge of exhibits, Daniel W. Smith, president Peter Smith Heater Company, Detroit, Mich.; vice-president in charge of entertainment, E. F. Wickwire, general sales agent Ohio Brass Company, Mansfield, Ohio., and secretary-treasurer, H. G. McCon-

naughy, manager Dearborn Chemical Company, New York, N. Y.

ADDRESSES AT SPOKANE

As was mentioned briefly in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 2, page 674, the officers of the American Electric Railway Association and the American Electric Railway Manufacturers' Association, during the visit to Spokane on Tuesday, Sept. 28, received an invitation to meet the members of the Chamber of Commerce of Spokane. The occasion was the regular Tuesday noon luncheon of the Chamber, the rooms of which occupy two floors in the Chamber of Commerce Building. Several members of the "Red Special" party accompanied the officers to this luncheon. After the luncheon five of the members of the party were asked by the president of the Chamber to address the members on the current problems of the electric railway industry.

C. Loomis Allen, president of the association, made the first address. He said that the American Electric Railway Association stood for the idea of getting together with the kind of men represented by bodies of the kind he was addressing. He then said that he was going to talk from the corporation standpoint. The electric railway industry is practically at a standstill. There has been little development in it recently except that which was enforced. The reason is that there is no complete understanding of the situation between men interested in the electric railway industry and men of the type represented by chambers of commerce. The men in the electric railway industry are engaged in a business undertaking. As he looked at the matter there were four parties in interest. The first of these was the consumer, that is, the man who pays fares to ride on the cars; the second was the employee; the third was the municipality, and the fourth was the investor. These four interests must get along together. If any one or any two try to get an undue share out of the industry, the others can do nothing. He was of the firm belief that if the country was to grow and if the cities in the country were to prosper, they could do so only if the transportation interests of the country develop with them. He believed that it was the duty of the members of every chamber of commerce in the country to inform themselves in regard to the electric railway situation in the city in which they live and to see that each of the four parties mentioned is receiving proper recognition.

The next speaker was William J. Clark of the railway department of the General Electric Company at New York. Mr. Clark stated that all of those present had common interests. Electric railway men have as great a concern in the future development of America as anyone else. He then referred to the important development of the electrical interests in the Pacific states, brought about, in large part, by the invention of the Pelton wheel. He referred to a government report issued in 1880, which said that west of the Mississippi River there was no hydraulic development of more than 1000 hp. and contrasted that condition with the one at present. He also spoke of the alleged claim that the electric railways were over-capitalized and said that in Great Britain \$30,000,000 had been allowed in the accounts for the acquisition by the electric tramways of the earlier horse-car systems, whereas, in this country, \$963,000,000 has been expended for that purpose. In reference to the development charges since the adoption of electricity he said that the electrical manufacturing companies had been the cause of the erection of the most costly scrap piles which had ever been formed. Nevertheless, the development of public

utilities has cost less in this country than in any other, and the cost of service is less. The people did not realize the effect of the rising prices on the cost of public utility operations. Labor has gone up 20 per cent and more than 60 per cent of the operating expenses of electric railways was for labor. In spite of this fact and other increases in the cost of operation the operating ratio in 1902 in the country was 57.5 per cent and in 1912 only 59.7 per cent. In the State of Washington there had even been a decrease, in spite of the fact that in 1902 only 2.3 per cent of the passengers rode on transfers, while in 1912 the percentage was 21.

Charles L. Henry of Indianapolis, first vice-president of the association, was the next speaker. He said that the electric railway industry had as much to do with the prosperity of the country as any other industry. Railways had constantly been giving more service for the fare charged. In the horse-car days 5 cents paid for a ride of 3 miles or 4 miles. Now, it pays in some cities for a ride of 15 miles or 19 miles, although a nickel has less purchasing power to-day. The authorities should foster, not crush the industry. He remembered the day when the builder of an interurban line would have offered to him the deeds for his right-of-way if he would build the line.

William F. Ham, vice-president and comptroller Washington Railway & Electric Company, Washington, D. C., talked about the jitney. He described briefly its origin on the Pacific Coast and its spread through the country and called it the "itch" among electric railway diseases. It was not a good business proposition and he thought that it ought not to receive a cordial reception from business men. In Washington, for example, the railway companies were working hand in hand with the business men to make a beautiful city, but this could not be done if the jitneys took away the profitable short-haul business and neither the jitneys nor the roads could be prosperous. He described the motor-bus situation in Washington, D. C., where a line of motor buses under favorable circumstances had not been able to make any money. Jitneys could conduct only irresponsible service and they made good service on the local railways impossible. At first, owing to the newness of the business, it was difficult to know what to do about the jitneys. Now, however, they are being recognized as common carriers.

The final speaker was Charles C. Peirce, vice-president of the American Electric Railway Manufacturers' Association. After telling several stories Mr. Peirce said that there was no mystery about the electric railway business. It should be judged on the same basis as any other business. The railway in any city reflects the character of the culture or enterprise of that city. Its cars are the most conspicuous objects on the streets and visitors often judge the enterprise of the city by the character of its railway service and the appearance of the cars on its streets. What is needed more than anything else in the treatment of public utilities is sanity and common sense.

ADDRESSES AT PORTLAND

By way of amplification of the account of the farewell luncheon to F. W. Hild before his departure for Denver, given in last week's issue, the following paragraphs will be of interest. During the visit of the members of the "Red Special" party in Portland on Sept. 30, this farewell luncheon had been arranged by the Portland Chamber of Commerce. Several representatives of the American Electric Railway Association were invited to the luncheon, which took place in the rooms of the Chamber of Commerce. The oc-

casion was called "Electric Railway Day." The meeting was also combined with one which had been scheduled by the Jovians at the same hour.

At the close of the luncheon, which was attended by some 200 business men of Portland, the president of the Chamber introduced Franklin T. Griffith, president Portland Railway, Light & Power Company, as the toastmaster, and he in turn introduced C. Loomis Allen as the first speaker.

Mr. Allen spoke of the great influence which transportation lines had had on the development of Portland and said that the association which he represented was composed of business men. The industry, however, was confronted by problems which were the same in all parts of the land. These problems must be dealt with in a fair spirit if the industry and the investment in it are to be carried on successfully, and this solution should be undertaken in a business way. The speaker dwelt upon the absence of new construction during the past five years and urged business men to study the causes very carefully.

W. F. Ham of Washington, D. C., spoke on the subject of "Unjust Competition in Transportation," although he said that he knew more about the jitneys which did not exist than of those which did. He explained that the Public Service Commission of the District of Columbia had early ruled that the jitney was a common carrier, and that the same action had been taken by the Public Service Commission of Maryland in regard to jitneys in the neighboring city of Baltimore. Any other action was illogical. If the public exercises regulation over the gas, electric and other public utility companies with their irremovable property and consequent responsibility, why should it not do the same with the jitneys which are here to-day and gone to-morrow. The jitneys could not exist with equal regulation, but assuming that they could, the real question is, could they replace the street railways? This would be impossible in any large city. The electric railways must remain. The question then is, does jitney competition help the transportation situation in any city as a whole? Mr. Ham recommended that equal regulation be provided and that then the problem be allowed to work itself out. He also pointed out that the best asset of the business man is his reputation for good faith and fair dealing and that the same principle applies to municipalities. Capitalists will decline to invest money in any place where invested capital is known to be treated unfairly.

Charles C. Peirce of Boston attributed a large part of the present industrial depression to the unwillingness of business men to engage in politics. What is most needed, he said, is sanity in political affairs. If a new town was being established the first requisite would be a good water supply and the second good transportation facilities, but many cities send out "boosters" and then turn around and use the axes on their local railways. Massachusetts was rapidly going to the 6-cent fare because it was recognized there as a fundamental principle in railway as in other affairs that no one could continue to do business at a loss. In attacking its utilities a town was attacking itself. He enumerated as the trinity of successful railway operation, good service, wages and dividends.

Mr. Griffith then introduced the retiring manager of the Portland Railway, Light & Power Company, F. W. Hild, who had recently resigned to go to Denver as vice-president and general manager of the Denver Tramway, and expressed the regret of his associates at Mr. Hild's departure. Mr. Hild referred to the pleasant business associations formed during his five years in Portland and to his regret at leaving.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

A One-Ball Center Bearing

BY S. J. WITT, DIVISION MASTER MECHANIC WEST PENN
RAILWAYS, CONNELLSVILLE, PA.

The mechanical readers of the ELECTRIC RAILWAY JOURNAL will no doubt be interested in the results which we are obtaining from an improvement in center bearings.

We found that many of the old center bearings were so stiff that on short wheelbase trucks, mostly 4 ft. 8 in., it was impracticable to use a steel wheel on account of its tendency to mount short-radius curves, the steel wheel having a greater coefficient of friction and a more pronounced climbing tendency than the chilled-iron wheel. We also found that on the long 6-ft. wheelbase trucks the steel wheels wore out quite rapidly and also caused excessive screeching, guard wear and curve-rail wear, even though the curves were occasionally greased.

We then began to install anti-friction bearings, some of the ball raceway type and some of the rocker type.

PLAN AND SECTION OF ONE-BALL CENTER BEARING

The results, with these, were improved, but the bearings themselves gave a great deal of trouble from excessive wear, not being protected from grit and no provision being made to properly lubricate them.

The accompanying drawing shows a center bearing which we have developed and which has now been in use some five years with very satisfactory results. Those which have been longest in use show no perceptible wear and will operate exactly as well to-day as they did originally. We use a 1 1/2-in., high-grade hardened steel ball, set in two cups of especially hard bronze metal, all submerged in oil and thoroughly protected against grit.

We have found in actual practice that the frictional resistance of these one-ball center bearings is less than

the frictional resistance of the average ball raceway pattern of anti-friction center bearing in actual use, and since there is no wear it remains as good for years as when originally installed. One greasing will easily run these bearings two years.

Since installing them we have found that the average mileage on steel wheels, which was about 30,000 with the former bearings, has been increased to 130,000 to 150,000. We lose no more wheels from sharp flanges, as we did formerly.

The locking device is quite secure and strong enough, in case of a wreck, to pull out the bolster from the cars or trucks. It is also quite easily detached and requires no hole through the bolster at its weakest point.

Crossing Water Pipes Over Trolley Wires

BY G. H. MCKELWAY, LINE ENGINEER BROOKLYN RAPID
TRANSIT SYSTEM

During the present subway construction in Brooklyn, N. Y., it has been found necessary in some places to remove the water pipes crossing the street in which the subway is to be built from under the surface of the street and to install them temporarily overhead. The accompanying illustration shows how the pipes are installed and how they are protected from wild

CROSSING WATER PIPES OVER TROLLEY WIRES

trolley poles that might leave the wire and fly up and ground upon them.

At the sides of the street wooden towers about 10 ft. square are built and filled with heavy stones to a height of approximately 4 ft. to prevent their being overturned. Then suspension wires are carried across the street between the towers and securely anchored to them. As a continuation of these wires, guys are run from the tops of the towers and embedded in heavy blocks of concrete in the street behind them. Spiral-riveted steel pipe is used to carry the water across the street and the pipe rises from the mains vertically at the towers and crosses the street on wooden cradles hung from the suspension wires by means of suspenders, each with a turnbuckle in it so that the

height of the cradle can be properly adjusted. Boards are nailed to the cradles on each side of the pipe to form walkways for the use of workmen installing or removing the pipe.

Where the pipe crosses the trolley wire, boards are nailed to the footwalks and to the cradles, completely boxing in the pipe beneath and far enough up on the sides to prevent a pole from striking the pipe or the wires supporting it, all of which are, of course, grounded. On the bottom of the boxing boards are placed lengthwise with the direction of the tracks, short pieces being used, while on the sides where the poles are most liable to strike long boards are used at right angles to the direction of the tracks.

Kansas City's New Cars

BY R. L. WEBER, CAR ENGINEER, BOARD OF CONTROL,
KANSAS CITY (MO.) RAILWAYS

Fifty single-end, steel side-girder cars, 44 ft. 10 in. long, have recently been put in operation by the Metropolitan Street Railway Company, Kansas City, Mo. A description of the design details of these cars appeared on page 850 of the *ELECTRIC RAILWAY JOURNAL* for May 1, 1915, and while it was stated in that article that the estimated weight would be approximately 40,000 lb., it has been found that the actual weight of the finished car is only 37,700 lb., equivalent to 781 lb. per seat. This weight is distributed as follows:

Body, fully equipped.....	17,850 lb.
Trucks	11,400 lb.
Electrical equipment	8,450 lb.
Total weight	37,700 lb.

A very pleasing exterior appearance has been obtained by the continuous letterboard and the color scheme recently adopted as a substitute for the solid green with which the Kansas City cars were painted. Above the belt rail the car is painted with cream-colored enamel and the lower part of the body is a golden yellow. The roof and the trucks are painted gray, simulating the color of Kansas City dust, and the car trimmings are Tuscan red.

Among the features of the car are step-light reflectors which thoroughly light the step and the zone of alighting when the doors are open. Sockets on the

KANSAS CITY CAR—SHOWING STEP LIGHT OVER FRONT DOOR

bumper are provided for a pole to push stalled vehicles off the tracks in the absence of an emergency wagon, and the platform knees, which are straight from the bumper to the bolster, were attached directly to the bolsters instead of to the side plates, to minimize damage to the vestibule from collisions. This design also effectively prevents overturning or loosening of the bolsters.

A somewhat unusual method of signaling was adopted for these cars and it has been found to work out very satisfactorily. The motorman, when approaching a prospective passenger, gives the conductor one bell by means of the bell-cord handle. This indicates to the conductor that someone wishes to board the car and that he should be ready with the door without delay and also relieves him of any unnecessary operation of the doors at safety stops. In case of emergency the conductor may signal the motorman by the same bell cord. The starting signal, however, is automatic, giving the motorman a white light on closure of the rear doors. Push buttons in the body of the car operate a buzzer on the rear platform, and owing to the strong

KANSAS CITY CAR—SHOWING REAR AND FRONT PLATFORM ARRANGEMENT

dislike of motormen for the ordinary signal bell, a push button is also provided on the railing near the rear-door operating handle so that the conductor can give a buzzer signal to the motorman to stop. The tap-bell cord, it may be said, is concealed by running it through light conduit installed above the headlining, where it is out of reach of rowdies.

Other features of these cars are the safety treads set crossways in the ramps at the rear end of the car-body floor, and, as an emergency safety appliance, a plunger is provided beside the conductor's seat by which he may produce an emergency application of the air brakes. Comfortable cross-seat cushions were obtained by making them 35 in. long, which is sufficient to prevent seated passengers from overhanging into the aisle, and the cross-rail at the top of the seat back is offset 1½ in. to the rear of the seat, so that a passenger, when arising, does not disturb the seated passenger in the seat in front. The smooth lines of the one-piece pressed-steel seat pedestals improve sanitary conditions in that the collection of dust at these points is eliminated.

To keep the side plates in the proper plane at the bolsters and also to increase the section modulus at that point, the side sheathing is bent around the corner post and supported by a gusset plate riveted to the end sill, a pocket into which the corner post fits being left between the gusset plate and the bent-around portion of side plates. Steel panels between the belt rail and the letterboard at the corner posts are provided to resist racking of the roof. Pressed steel carlines are used, and they are supported by wooden sideposts. Holes have been punched through the horizontal legs of the angles which are installed along the middle of the side plates, and spaces have been left between the side posts and the side plates, these openings constituting provision for ventilation of the dead air space between the side plates and the inside finish. This space is also ventilated at the top and bottom so that the circulation of air will remove any sweat or moisture that many accumulate.

These cars were designed under the direction of William P. Woods and P. J. Kealy, representing respectively the city and the railway company, and they were built by the American Car Company, St. Louis, Mo.

Cement-Sack-Cleaning Machine Pays Big Dividends

A \$900 machine for cleaning cement sacks displaced three men and effected an annual saving of \$2,172 for the maintenance of way department of the Cleveland (Ohio) Railway. This machine is another of the ingenious inventions of Charles H. Clark, engineer maintenance of way, and comprises four essential parts—a motor, a drum, an exhaust fan and a dust collector. The motor drives both the cleaning drum through a set of reduction gears and the exhaust fan. The octagonal drum is 12 ft. in diameter by 5 ft. wide, and is constructed with wooden sides and a ½-in. mesh screen on the periphery. This drum is mounted on a shaft in a room which is made as nearly air-tight as possible, and the motor revolves the drum at the rate of about 10 r.p.m. At one of the upper corners of the room an air intake is installed and at the diagonally opposite corner an outlet leads through the exhaust fan to the dust collector. As the drum revolves the exhaust fan draws the air through, removing the cement dust which is deposited on the floor of the room. A small amount of cement is finally taken out by the dust collector. One thousand sacks are placed in the drum at one time and after revolving it for thirty minutes and allowing five

minutes for the dust to settle, the clean sacks are removed.

Heretofore the way department of the Cleveland Railway found it necessary to detail three men to clean cement sacks. These men beat the sacks against a post, no attempt being made to save any considerable quantity of the cement by this method, however. These three men received 20 cents per hour, and they cleaned approximately 1000 sacks a day. As the way department uses an average of 250,000 sacks of cement a year, the time consumed by the men in cleaning the sacks was considerable. It was found that 1000 empty cement sacks weighed 1313 lb., but after being machine cleaned they weighed 606 lb., thus a reduction in weight of 707 lb. was effected. The freight rate on sacks returned from Cleveland to the cement mill was 8 cents per hundred, hence a saving of 56 cents per thousand sacks in the freight charges was obtained. This represented a total annual saving of \$120 in freight alone. In addition to the freight saving, the 707 lb. reduction in weight represented cement salvaged from the empty bags. In other words, 1¾ barrels of cement were salvaged per thousand sacks, and 442 barrels of cement represented the annual saving from 250,000 sacks. The value of this cement at \$1.25 per barrel was \$552.50. Besides these two items the labor of the three men employed in cleaning the sacks was rendered unnecessary, hence an additional saving of \$6 per thousand sacks, or \$1,500 a year, was made.

In a room adjoining the building occupied by the cement-sack-cleaning outfit storage space for empty sacks was provided. This storage room was equipped with a stove and a special sewing machine for mending torn bags. During the winter months one of the men in the concrete gang who had become an expert at mending was detailed to the work of patching bags. As a rule this man will mend between 200 and 250 bags a day, for which he receives \$2. Hence the expense of mending the sacks is very small, and when in good condition they may be returned to the cement company and a rebate of 10 cents per bag obtained. A cement-sack-bundling machine also forms part of the equipment of this storage room.

Automatic Railway Substations

In the current issue of the *General Electric Review* appears an article on this subject by Cassius M. Davis. In this he refers to the Elgin & Belvidere Electric Railway substations which were described in an abstract published in the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 18, 1915, page 583. He states that the automatic type of substation was chosen by this railway to reduce operating expense by eliminating light-load and no-load losses and by rendering the presence of attendants unnecessary. He credits Alex Dow, president Edison Illuminating Company of Detroit, Mich., with important pioneer work in this field.

Mr. Davis gives the results of calculations based upon conservative estimates of the requirements of a road operating cars on an infrequent schedule. The results are shown in the accompanying table. He claims that even when cars run under such short headway as to require the continuous operation of some of the substation equipment an appreciable saving can be secured by automatic operation of other machinery in the substation. As a definite example of this condition he takes the case of a substation containing two 300-kw. converters, one of which is in continuous operation from 6 a. m. until 2.30 the next morning, and the other machine from 6 to 7.45 a. m. and again from 3.45 to 9.30 p. m. The service assumed on the road calls for trains

COMPARISON OF HAND-OPERATED AND AUTOMATICALLY OPERATED SUBSTATIONS

	Hand Operation	Automatic Operation
Headway between trains.....	120 minutes	120 minutes
Number of substations.....	Four	Four
Capacity of each substation....	300 kw.	300 kw.
Actual time machines operate operate per day.....	18 hours	7 hours
No-load losses per substation....	12 kw.	—
No-load energy losses per day per substation.....	132 kw-hr.	—
Cost of energy at substation... 1 cent per kw-hr.	1 cent per kw-hr.	1 cent per kw-hr.
Value of energy saved per day per substation.....	—	\$1.32
Value of energy saved per year per substation.....	—	\$482.00
Number of operators or inspec- tors.....	Eight	Two
Wages of each operator or inspector per month....	\$65.00	\$65.00
Total wages per year.....	\$6,240.00	\$1,560.00
Value of wages saved per year....	—	\$4,680.00
Value of energy saved per year....	—	\$1,928.00
Total saving per year.....	—	\$6,608.00

each way every half hour with extra cars during the morning and evening rush hours.

Under this condition it is estimated that the first machine when running alone operates at no load for a period of 3.4 hours. The no-load loss of the converter and transformers is approximately 12 kw. Therefore, the energy loss per day is approximately 41 kw-hr. or a total of 14,965 kw-hr. per year, which at 1 cent per kilowatt-hour means approximately \$150 per year. During the time the two machines are operating it is estimated that there is no load on either machine for a period of eighteen minutes per day, which represents a no-load loss of approximately \$15 per year. Furthermore, during the time the two machines are operating, it is estimated from a typical load curve that the second machine could be shut down a total of at least two hours when it is not required to carry load peaks. The no-load losses during this time would amount to 24 kw-hr. per day, which represents approximately \$88 a year at 1 cent per kilowatt-hour. This station could, therefore, save at least \$253 per year in power alone. There would also be a slight additional saving during the time when the two machines are running, due to the fact that under automatic operation when two machines were necessary, both would be operating at a high efficiency.

A Handless Curtain Fixture

The Railway Supply & Curtain Company, Chicago, Ill., has just brought out a new type of curtain fixture, named the "Handless" because it has no pinch handles. The curtain may be operated from any point along the bottom. It is made for a wide range of adjustment to

CURTAIN WITH FRICTION DEVICE ON ROLLER TIPS

suit the variations in the width of window frames. The double-acting friction device, which holds the curtain at any desired height, may be pushed up or pulled down without friction or resistance of any kind.

This fixture is of standard dimensions so that it will fit the usual window grooves, and it cannot be removed from these grooves in the ordinary manipulation of the curtain. Another feature is that the tip has a special connection whereby it is permitted a certain amount of

lateral action. At the same time a locking device prevents it from being displaced beyond the limits of play except when adjustments are desired, or when the fixture is to be taken apart. This fixture is made up with any of the customary curtain fabrics.

Light-Weight All-Steel Panel Heater

A new type of heater is being installed by the Interborough Rapid Transit Company on the 478 new cars that are being placed in service on the New York subway. This is a new design that has been brought out by the Gold Car Heating & Lighting Company, New

Section on Center Line

Section Through Porcelain

TWO-COIL PANEL HEATER

York, for general service on electric railway cars. In it all of the metal parts have been made of pressed steel, and the weight has thus been reduced to a material degree. A feature is the use of resistance-coil supports made of Gold's ventilated porcelain cores, which are perforated so that air is allowed to pass through the coils as well as around them, providing an efficiency which is not found when solid porcelain supports are used. This feature, in fact, increases the effectiveness of the heater to such an extent that it is found in practice that cars equipped with them can run longer with the heater switch in the first position than cars equipped with the ordinary types of heater.

Among the other features are resistance coils made

ALL-STEEL PANEL HEATER

of special non-corrosive wire which will not rust or otherwise corrode, thus reducing maintenance to a minimum. The heater is quickly detachable for repairs or renewals, as the removal of two nuts releases both heating elements through the front of the heater case. The heater also is fitted with special binding posts or spring-clip terminals as desired, the former, which are shown in the accompanying cut, providing an especially simple and rugged construction.

Single-Circuit Metal-Arm Construction

Among the various features of equipment for single-circuit metal-arm transmission line construction that are manufactured by the Electric Service Supplies Company, Philadelphia, Pa., is the self-contained cross-arm construction known as the Keystone triangle. This consists of one horizontal lower member made of steel angle sections and one upper member of flat steel formed to go over the pole top, thus serving as a support for the top insulator of a three-phase line and as a

TRIANGLE CROSS-ARM WITH BAYONET FOR GROUND WIRE ATTACHED

brace for the horizontal arm. The device is as strong as an ordinary arm of the same weight when the pull is applied at any transverse angle and is decidedly stronger on pulls that are applied at angles below the horizontal. Its ease of installation is obvious. One of its advantages is the fact that the bottom bolts, or those in the cross-arm, are at right angles with the two upper bolts which attach the flat steel member to the pole. This serves to increase the strength and rigidity of the installation, particularly against strains applied horizontally with the wire. Naturally, the construction allows the wires to be spaced in a true triangle, each one being located in a different vertical plane. Therefore, if one wire breaks it is not likely to short-circuit one of the other phases, an advantage of inestimable value. As the construction actually comprises an extension of the pole top its use means an economy in pole length, and for a given clearance between line wires and the ground a shorter pole may be used than would otherwise be the case.

GROUND WIRE CLAMP

For holding the ground wire to the top of the bayonet either a Keystone ground-wire clamp or a U-bolt clamp may be used. The action of the latter is obvious, but with the former there are several unique features, one of these being the fact that the clamp is made of two malleable-iron castings held in position by a single bolt with lock nut and washer. The castings are identical in form and they are furnished either galvanized or sherardized. Their design is such that they hold the cable away from the sharp edges of

the angle-iron support and thus prevent cutting or chafing. The groove is designed with flared ends with a similar purpose in view, the grooves being furnished either corrugated or plain.

While the Keystone clamps are designed especially for use with bayonet construction, such as applies with Keystone triangles, they are also eminently suited for attaching ground wires direct to a wood pole through the use of one through bolt and they have been very largely adopted for this purpose. In any case they afford a simple, cheap and very efficient device.

In addition to the foregoing items of transmission line equipment there should be mentioned the Keystone truss pin, of which more than 500,000 are in service. These are of the separable thimble type and their use is not limited to the Keystone triangle arm, as they may be installed wherever insulators with cemented thimbles are to be applied. They are made in many styles to meet all modern service conditions, the accompanying illustrations showing types for angle-iron cross-arms such as used on Keystone triangles and also for curved-base wooden cross-arms. Great flexibility among standardized insulators or standardized pins is secured by their use, because all Keystone thimbles cemented in any insulator are perfectly interchangeable with any type of Keystone truss pin.

TRUSS PINS FOR ANGLE-IRON ARMS AND ROUNDED WOOD ARMS

Special rigidity and strength are secured by the design of the trussed base and by the use of solid drop-forged steel and bolts. These bolts are non-rotatable, making the installation of the insulator an easy matter, and as they are made so as to be subject to tensile strains only, the combination will behave perfectly under heavy pulls in any direction. The pins or insulators can never come loose in service. They are very easy and cheap to install in the first place, and damaged insulators are very easy to replace. The groove of the insulator may be perfectly aligned with the wire, and at the same time the insulator and pin are kept perfectly tight.

To complete this line of transmission system material the company furnishes the well-known Locke insulator, a name that has been synonymous with good insulation for years. Superior facilities for manufacturing insulators, the most up-to-date facilities for testing, and a record of millions in service in all parts of the world amply demonstrate the ability of the Locke insulator to meet successfully the most adverse conditions.

News of Electric Railways

COMMISSION FIXES SERVICE STANDARDS

Salient Features of Comprehensive Chicago Service Order, the First in that City Ever Fixing a Standard for Rush Hours

Seats for all passengers outside the rush hours and a minimum of eighty-five seats for each 100 passengers during the peak of the rush hours, trailers and switchbacks outside of the loop district, are the salient features of a comprehensive service order issued by the State Public Utilities Commission of Illinois to the Chicago Surface Lines. This order grew out of complaints filed by the Cook County Real Estate Board and was based upon evidence collected from the officials of the railways, the city and the public. The rush-hour service standard is considered to be very severe. This is the first time any regulating body has attempted to fix a standard for Chicago's rush hours. Trail car operation is prohibited by city ordinance. This question of conflict, together with that of the jurisdiction of the commission and the City Council, has already been raised.

Rush-hour and non-rush-hour service standards fixed by the commission provide that between the hours of 6 a. m. and 12 o'clock midnight, except during the morning and evening rush hours of all week days, all cars passing any given point during any fifteen-minute period shall have an aggregate seating capacity equal to the total number of passengers carried. On lines where less than three cars pass a given point during the fifteen-minute period, the time of the check is extended to include three consecutive cars going in one direction. On all lines and routes the maximum headway is not to exceed twenty minutes for the entire day, excepting the six hours between 12 o'clock midnight and 6 a. m.

During the morning and evening rush hours, which were tentatively fixed as the period between 6.30 a. m. and 9 a. m., and 4.15 p. m. and 6.45 p. m. on all days except Sundays and holidays, two standards of service are provided, one for the transition periods and the other for the peak of the rush. During the maximum rush period of one and one-half hours, an average of eighty-five seats for every 100 passengers carried is fixed as the standard. During the transition periods, immediately preceding and following the maximum rush hour, ninety seats for each 100 passengers is fixed as the standard. The exact time of the rush-hour periods was not fixed for all parts of the city, other than that it was considered to extend over a two and one-half-hour period. For different locations throughout the city, particularly outside the loop district, the railway company will be authorized to fix the rush period upon filing a written notice with the commission. During the period from midnight to 6 a. m., the commission ordered that the service should be such as to meet the demands of the public and the conditions of travel, but that the schedules covering this period should be filed with the commission for approval.

The standard of loading for each of the rush-hour periods was specified as applying to any half-hour period consisting of any two consecutive fifteen-minute periods. The standard for non-rush-hour periods was fixed for fifteen-minute periods. The demand for service was separated into Sundays and week days, and the average count of passengers for three consecutive normal week days was considered sufficient to give a fair average. The average count of passengers for two consecutive Sundays was considered a fair average of Sunday service demands. Traffic surveys must be made from time to time, subject to the order of the commission, both as regards time and place of checking points.

Tracks were deemed by the commission to be operated to their full capacity when the combined headway of cars passing any checking point in the same direction was twenty seconds or less. Exception was made, however, for lines operated through tunnels, where an average headway of thirty seconds or less was deemed to be the full capacity of the tracks. To comply with the order of the commission as regards a service standard, the surface lines were ordered to proceed at once to make service checks, and within sixty days or by Dec. 1, to file a statement showing the location of the maximum traffic points outside the loop district for all

lines and routes and for both the morning and evening rush periods. With this information the railway company was ordered to state what it deemed the morning and evening rush-hour periods for the various lines and routes checked.

Turn-back service in the territory immediately outside of the Chicago loop district sufficient to comply with the service standards was also ordered by the commission. Plans showing this service installed, as well as the scheme for re-routing cars in the downtown district to secure maximum track capacity, were ordered to be filed with the commission by Dec. 1. In case the railway found its present equipment insufficient to comply with the provisions of the order, it was ordered to proceed immediately to acquire the necessary equipment. The commission believed trailers would materially increase the track capacity and ordered the company to install within sixty days such trailer service during the rush hours as was necessary to comply with the service standards.

To clear up the question of jurisdiction, the commission ordered the railway to apply within thirty days of the date of the order to the proper municipal authorities for all necessary permits and authority. Other questions of service included in the commission's order provide that separate route and destination signs must be displayed on the front ends and route signs on the sides of all cars. All plans for new passenger cars as well as those for remodeling old passenger cars must be submitted to the commission for its approval of the width of passageways, height and location of seats, platform arrangements and such other details as might affect the adequacy of the service.

In a digest of the order given out to the local newspapers, the commission directed the attention of the municipal authorities to the serious delay to cars caused by vehicles in the congested districts during the rush hours. It was recommended that the city prohibit the use of the tracks by vehicles during the rush hours. The commission also suggested that the companies employ additional traffic supervisors with authority over trainmen, these supervisors to be stationed at important transfer and loading points to hasten the loading and movement of cars, and thereby increase the number of seats. The commission also called attention to the extraordinary congestion on Jackson Boulevard, the only east and west artery through the loop district devoted exclusively to vehicular traffic. It was suggested that Washington Street also be given over entirely to vehicular traffic.

Unification of the surface and elevated railroad lines in the near future was also considered important to provide adequate transportation facilities. The commission expressed the opinion that considering all the traffic difficulties existing in Chicago and the increased traffic demands which would come with the natural growth of the city, steps should be taken immediately to make use of all transportation facilities by the construction of subways.

FORT WAYNE CARS IN FULL OPERATION

No further violence or serious disorder has occurred in Fort Wayne, Ind., since Sept. 29. All regular cars have been in full operation, although up to Oct. 4 service was suspended about 6 p. m. On Oct. 4 cars were operated until 10 p. m. without interference. Assistance for the striking street car men has been voted by the various labor organizations in Fort Wayne, and members of unions are forbidden to ride on the street cars under penalty of fine. The hearing for an injunction, which was to have been held in the Federal Court at Indianapolis on Oct. 5, was postponed until Oct. 27, in accordance with agreement between the opposing counsel. The case of the United States Mortgage & Trust Company, trustee under the mortgage of the Fort Wayne & Northern Indiana Traction Company, against Joseph C. Colgan, executive officer of the Amalgamated Association, for contempt of court, filed after the trainmen at Fort Wayne went on strike after a temporary restraining order had been granted by the United States Court against Colgan and others, will also be heard. In connection with the postponement the attorneys for the defendant allege that the United States Dis-

trict Court for the District of Indiana has no jurisdiction in the case, as Colgan says he is a resident of Chicago, while the plaintiff trust company is a New York company.

Cars in Fort Wayne continue operating until about 10 p. m., but several cases of the stoning of cars have been reported. President J. M. Barrett of the company addressed an appeal to the citizens of Fort Wayne to assist the company in the exercise of its lawful rights and to patronize the cars. On Oct. 8 all cars were reported as being operated on schedule and with increased traffic.

Superintendent of Transportation J. J. Brennan of the company stated that on Oct. 9 the company would assign regular runs to the men working on the cars and that the assignments would be permanent, with the seniority rule in force. Several old men have reported to the officers of the company and asked to be assigned to work.

J. C. Colgan, the organizer for the Amalgamated Association, has stated that the men would be willing to meet the officials of the company for a conference leading to arbitration, but that they would not accept the members of the Public Service Commission as a board of arbitration.

Mayor Hosey on Oct. 7 proposed to the company that Governor Ralston should decide whether a local arbitration board or the Public Service Commission should arbitrate the strike. This proposal was refused by the company.

SAN FRANCISCO CONSIDERS AN ELEVATED LINE

At a session of the International Engineering Congress, held recently in San Francisco, there was some discussion of the possibility of an elevated railway in San Francisco, in which M. M. O'Shaughnessy, engineer of that city, took part. In response to a request for comment on the means now being considered for improving transportation facilities in San Francisco, Mr. O'Shaughnessy has supplied the following statement to the *ELECTRIC RAILWAY JOURNAL*:

In the near future something will have to be done to reduce the time required to travel from the business section to the western residence districts of the city and to relieve the congestion on lower Market Street, the main traffic artery of San Francisco. The time required to travel from Third and Market Streets to the western residence districts could be reduced by twenty minutes if an express train service were provided. The economic advantage of the saving of forty minutes of time lost in two daily trips of each of 50,000 passengers daily would justify an expenditure of \$50,000,000 by the community. In addition a rapid transit system would at once infuse stability and confidence into the outlying and Peninsula sections and help to increase the population of the city.

The possibilities of subway and of elevated lines have both been considered. Objections to subways were found to be greater than the objections to elevated lines because of the greater first cost, ventilation difficulties and time required for the construction of the subways. The cost of a subway system was estimated to be \$3,500,000 per mile of double track as against \$800,000 per mile for an elevated system. The cost of surface lines with 106-lb. rails in San Francisco has been found to be about \$218,000 per mile. The greatest problem in undertaking to provide a rapid transit system in San Francisco is that of educating the public to a point where the prejudices to the elevated system will be overcome.

NATIONAL ELECTRICAL CODE CONFERENCE ON OCT. 27 AND 28

The deferred conference in Washington on the proposed national electrical safety code will be held at the bureau of standards on Oct. 27 and 28, in accordance with the announcement made several months ago. Official delegates have already been appointed from the American Institute of Electrical Engineers, National Electric Light Association, American Electric Railway Association, American Railway Association and many other organizations. The bureau of standards will report to the conference concerning the work which has been done in the preparation of the proposed code and present the latest revised copy of the text of the code. It will also present some recommendations with regard to the method of revising the code in future

and of its administration by the various States and municipalities. The bureau will recommend, however, that the code shall not be made mandatory until after its tentative use for one year, in order to give the commissions and municipal authorities, as well as the utility companies, an opportunity to become thoroughly familiar with it and to permit the experience of one year to be utilized in its further revision before being made mandatory. About 100 delegates are expected to attend the conference.

ULTIMATUM IN SEATTLE PAVING CASE

Mayor H. C. Gill of Seattle, Wash., in a recent communication to the Puget Sound Traction, Light & Power Company, issued an edict stating that unless the company paved between its tracks in accordance with franchise requirements on the streets where the city of Seattle is laying paving, he would immediately recommend to the Council the revocation of the corporation's street railway franchises. A. L. Valentine, superintendent of public utilities of the city, has notified the company that improvements must be made at once on five separate street paving jobs.

In reply, the company stated that it had an application before the Public Service Commission for relief from this paving exaction, as well as from other franchise obligations, and that until this was disposed of, the company could not see its way clear to comply with the request which the city has made.

In discussing the matter Mayor Gill was quoted recently in part as follows:

"I will not submit to the company setting aside its franchise at this time and failing to pay 2 per cent of its gross revenues to the city when they come due simply because it has a matter pending before the Public Service Commission. Fifty-five thousand dollars has been included among revenues in the city budget for this amount, and I propose that the company shall pay it, unless the city is restrained by court order. Charles A. Reynolds, chairman of the Public Service Commission, has been quoted as saying that he will not consider the application of the company until a valuation of the company's properties has been completed. This valuation will not be completed, according to present estimates, until the last of next year. Should the company agree to pave its right-of-way under agreement to accept a refund in case the city should lose in litigation with the company, then I will not send my recommendations to the Council. The city cannot wait on its paving until the commission has valued the company's properties, and held a hearing on the company's application."

OPINION IN OHIO REGARDING LOCATION OF INTERURBAN TRACKS

Attorney-General Turner of Ohio rendered an opinion on Sept. 22 to the effect that interurban railways with tracks along the side of the public highways may be compelled to move those tracks to the center of the highway when it is necessary for the proper paving and improving of the space and that the owning corporations must pay the entire expense of relocating the tracks. Not only this, but they must pave the space between the tracks and to the distance of 1 ft. on either side. This opinion was rendered to State Highway Commissioner Clinton Cowan, who is preparing to build a 40-ft. pavement for a distance of 3810 ft. on the extension of North High Street north of the corporation limits of Columbus. The tracks of the Columbus, Delaware & Marion Railway extend along the east side of this highway. The franchise granted the company by the County Commissioners gives it the right to occupy that particular location, but Attorney-General Turner asserts that it is not within the power of the commissioners to make a grant that will impinge on the higher power—the police power—of the State. This is the power that insures the people their rights, and no authority or power is above the rights of the people to the best service and the highest degree of safety commensurate with the conditions. One of the rules of traffic, he says, is that all travelers shall use and keep to the right-hand side of the road or street. It is necessary to change the tracks to the center of the street in order to do this. Any other method of travel

would result in great confusion and danger. The commissioners had a right to grant a franchise, but not to limit the location so that these rules cannot be carried out by the public. He says that as there is no provision in the laws whereby the cost of relocating electric railway tracks shall be paid from the public highway funds, the company must stand this expense.

ROCK SLIDES GREATEST MENACE TO NEW YORK SUBWAY WORK

That New York City's subway work is being carried on in general in accordance with the best practice, that rock slides such as occurred Sept. 25 on Broadway, at Thirty-eighth Street, constitute the "greatest and only serious menace" to be guarded against, that cross-bracing should be used wherever there is any doubt as to the strength of the rock foundation, that the permanent construction should be kept as near as possible to the headings, and that constant inspection of the temporary street supports is necessary, are the conclusions set forth in the report to the Public Service Commission by Edmund S. Davis, chief engineer of the Boston Transit Commission, and Henry H. Quimby, chief engineer of the Philadelphia Department of City Transit, made public on Oct. 6. These men were retained by the Public Service Commission to make a report on the construction methods in use, and to recommend, in view of the recent failures of subway decking, changes to insure against a repetition of either accident. In the light of experience gained as a result of these accidents the engineers made the following recommendations:

(1) That throughout the present construction, at every point where the trench is in a rock with inclined strata, showing open seams or other evidence of actual or threatened disintegration, the sides be shored across the trench so as to form a continuous strut from side to side of the trench, with additional supports in the shape of raker braces if projecting portions of rock afford the necessary hold.

(2) That an effort be made to systematize the work so that the sequence of operations will carry the work of excavation and the erection and concreting of the permanent subway structure close together, so as to require as little falsework and temporary decking of the street as possible.

(3) That in future work preference be given to a type of timbering that will provide continuous needlebeams or struts from side to side of the trench, with the joints of the uprights firmly spliced to prevent buckling.

(4) That a periodic inspection be made of every point of contact of shoring with the banks, as well as of all connections of members to insure continuous tightness and prevent deterioration of the timber work from vibration.

Among other things the engineers said:

"In our tour of inspection we have found that, with the few exceptions noted, the work of subway construction is being prosecuted throughout in the most thorough and systematic manner. Considering the magnitude of the work and the great extent and variety of the operations, the instances of failure of any sort resulting from carelessness, or otherwise, in the conduct of it are remarkably few."

ADDITIONAL INDORSEMENT OF TOLEDO GRANT

The Toledo Retail Merchants' Board, at its annual meeting on Oct. 5 approved the street railway franchise ordinance which has been initiated at Toledo, Ohio.

On Oct. 1 a temporary restraining order was issued in the Court of Common Pleas to prevent the enforcement of the order of the city that the railway tracks on Huron Street between Orange Street and Stickney Avenue and on Stickney Avenue between Huron and Erie Streets be removed at once. This action was taken at the instance of City Solicitor Thurstin and former City Solicitor Cornell Schreiber, and was intended to give Council and opportunity to push the matter through or rescind the order for the present. It was found that the approval of the Dotson franchise by the people at the fall election would give the company the right to tear up the new pavement that is to be built on the streets mentioned in order to relay its tracks, and the property owners objected to this. Council decided on Oct. 4 to notify the company that the removal order will not be enforced until after the election on Nov. 2, whether or not the restraining order is made permanent.

HYDRO-ELECTRIC PLANS MATURING

T. J. Hannigan, Guelph, Ont., secretary of the Hydro-Radial Association of Ontario, has notified Mayor Church of Toronto that preliminary surveys have been made and plans and estimates of the cost prepared for the proposed hydro-radial lines in the Toronto district. He asked that the city appoint three delegates to join representatives of other municipalities interested to inspect the plans. It is rumored that the Hydro-Electric Power Commission of Ontario has arranged to acquire the Toronto Suburban Railway from Toronto to Guelph. While confirmation of the story could not be obtained, it is regarded as likely that some tentative arrangement will be made whereby the commission may incorporate the suburban line in the proposed network of radials. Chief Engineer Gaby of the commission said that nothing in regard to the matter and the route of the proposed radial lines could be divulged until after the representatives of the municipalities had been consulted.

Alabama Utilities Bill Passes House.—The Denson public utility bill, transferring control of public utility corporations from municipalities to the State, has been passed by a vote of forty-nine to thirty-two. Only a few minor amendments were considered.

Planning for the Minneapolis Appraisal.—The sale of \$15,000 of bonds to provide funds for conducting the franchise negotiations with the Minneapolis (Minn.) Street Railway was expected to be taken up by the City Council on Oct. 8. F. W. Cappelen, city engineer, who will have charge of the work, has stated that the appraisal will be started within two weeks after the bonds have been sold.

Albany Arbitration Adjourned.—The first meeting of the arbitrators named to inquire into and settle the differences between the United Traction Company, Albany, N. Y., and its employees which led to the strike of Sept. 6, was held on Oct. 1. The arbitrators organized by choosing Judge Lynn J. Arnold chairman and adjourned to Nov. 4. The principal difference between the company and its employees is over the methods of discipline.

Yonge Street Order Issued.—The Ontario Railway & Municipal Board on Sept. 21 issued an order directing that the Yonge Street tracks of the Toronto (Ont.) Railway must be extended from the present terminus to Farnham Avenue, and that the cars must be in operation over this section of line by Dec. 1 of this year. The order backs up the opinion of the board, rendered some days ago, that the company had a right to extend its Yonge Street tracks to occupy the space lately vacated by the Toronto & York Radial Railway. The city of Toronto will have to lay the necessary roadbed for the company's rails, as is the case with all lines in the city.

Springfield Trolley Pole Removals.—Agreements have been prepared by the Springfield, Mass., City Planning Commission for submission before Oct. 16 to property owners in the downtown district relative to the removal of trolley poles on Main Street between State Street and the Union Station. The agreements have been prepared in blank and approved by City Solicitor C. H. Beckwith. When signed by the property owners and the Springfield Street Railway the agreements authorize the removal of the poles and the attachment of span wires to the buildings at the expense of the company, which has agreed to meet the cost of the change, made desirable by increasing traffic congestion.

New Orleans Street Railway Resumes Service After Hurricane.—Practically all street car service was resumed on Oct. 7 on the lines of the New Orleans Railway & Light Company, New Orleans, La., following the terrific hurricane which swept the Gulf Coast last week. The delay to service has been entirely due to the cutting off of power because of fallen wires. Relief work was badly handicapped by continuous heavy rains following the storm. The roofs of the Poland, Prytania and Claiborne carhouses were badly injured, resulting in slight damage also to about thirty cars which were in these carhouses at the time. The main power house suffered damage to its roof and through broken windows, amounting to about \$1,000.

Rhode Island Arbitration Testimony Concluded.—Presentation of testimony in the Rhode Island Company's arbitration case was concluded on Sept. 29 at Providence, when an adjournment was taken to Oct. 25, when final arguments are to be submitted by counsel on each side. It is expected that two days will be required for arguments, and a finding is anticipated by the board by Nov. 26. The hearings have covered forty-three days and have resulted in the presentation of 192 exhibits, 105 witnesses and 3431 pages of typewritten testimony aggregating about 837,750 words. The final hearing was devoted to clearing up various loose ends of testimony which had been carried over from previous sessions. An analysis of the company's financial status tending to show ground for confidence in the future of the road was submitted by Arthur Sturgis, Boston, on behalf of the employees.

Electrolysis Report at Providence, R. I.—R. B. Brunet, public service engineer of the city of Providence, R. I., has submitted a report on electrolysis within the municipality to Commissioner of Public Works Slade. The report sets forth a number of cases of corrosion of water pipes and cables, gas pipes and other structures, and states that 2191 open and defective rail joints have been found in the local street railway system. This is about 15 per cent of all the joints in service. The report recommends that temporary bonding be required of the Rhode Island Company at points where new tracks are being installed, repairs being made or special work under construction; that the company be requested to hasten the rebonding of track at points known to be defective; that broken or imperfect rails be repaired or removed as soon as discovered, and that the company be formally requested to bond all joints and track networks electrically.

Completing Connecting Railroad Bridge.—Samuel Rea, president of the New York Connecting Railroad, on Oct. 1 sent a message to Gustav Lindenthal, chief engineer of the East River Bridge Division of the New York Connecting Railroad, congratulating him as designer and chief engineer of the East River arch bridge upon the closing of that great arch that day. Mr. Rea said in part: "Within eighteen months I hope we will see the completion of the New York Connecting Railroad and of the Seventh Avenue subway in Manhattan, which will conclude the Pennsylvania Railroad's comprehensive program for terminal development in and through New York City, adopted thirteen years ago under the presidency of A. J. Cassatt. With these projects completed full opportunity will be afforded to measure the benefit of the New York terminal improvements to the public, the country at large and to the company." The new bridge will afford a connecting link between the New England railroads and the trunk lines serving the West and South and make unnecessary the ferriage of cars around New York.

Chicago Mayor Urges Subway Construction.—Immediate construction of four-track subways in the downtown district and the unification of the surface and elevated lines formed an important part of the annual message of Mayor William Hale Thompson to the Chicago City Council. The Mayor supported the initial subway scheme, but suggested that it contain four tracks and be used by the cars of both the surface and elevated lines. He proposed that the subways be constructed by the city in and through the downtown district, extending out as far as the present needs of the traffic situation warranted, and that they be operated as a unified system of transportation on a rental basis. The message stated that to accomplish this a tri-party agreement between the city, the elevated railways and the surface lines would be necessary. In order to formulate a concrete scheme as promptly as possible, the Mayor suggested that experts familiar with the engineering and financial problems involved be appointed by the city and companies. The plan worked out by these experts should later be submitted to the City Council and finally in referendum to the people of Chicago. If the elevated and surface lines agreed to become parties to such an arrangement, the Mayor believed it would be necessary to give Chicago the right to purchase the elevated properties at any time, and that the price be fixed either before the negotiations are consummated, or at some future time when it has been decided to consider the purchase.

Financial and Corporate

STATUS OF MICHIGAN COMPANIES EXPLAINED

Organization and Extent of Michigan United Traction Company and Michigan Railway Described to Avoid Confusion

On account of a possible confusion of the Michigan United Traction Company, the Michigan United Railways and the Michigan Railway, it is deemed wise to print the following facts:

The Michigan United Traction Company leases from the Michigan United Railways (simply a consolidated non-operating company) and operates the city lines in Kalamazoo, Battle Creek, Jackson, Lansing and Owosso, Mich. It also leases and operates two 600-volt third-rail interurban divisions. The northern division includes the trackage from Jackson to Owosso and Corunna and from Lansing to St. Johns. The southern division includes the trackage between Jackson and Kalamazoo, passing through Battle Creek, and from Jackson and Grass Lake to Wolf Lake. This is also a short spur from Gull Lake Junction to Gull Lake. The Michigan United Traction Company also operates between Kalamazoo and South Haven a steam road called the "Fruit Belt Line" connecting with Chicago boats at South Haven.

The Michigan Railway owns and operates as its northeastern division an interurban line running between Bay City and Flint and a spur line from Saginaw to Frankenthum. This is a 1200-volt line, and the portion between Bay City and Saginaw is operated with a third-rail. Arrangements have recently been made with the Detroit United Railway for the operation of through limited-passenger trains between Bay City and Detroit, the Michigan Railway furnishing new all-steel cars for this service.

The western division of the Michigan Railway includes the 2400-volt third-rail lines between Kalamazoo and Grand Rapids, Battle Creek and Grand Rapids, and Monteith Junction and Allegan. Aside from these this company is building a 2½-mile detour between Yorkville and Gull Lake Junction on the line between Battle Creek and Monteith Junction, which will put Gull Lake on the main line. The existing spur track from Gull Lake Junction, as well as that section of the main line cut off by the new route, will be abandoned. This company is surveying for a 35-mile extension between Owosso and Saginaw. When this is completed limited service will be given between Jackson and Bay City.

Tickets are being sold from all points on the Michigan United Traction Company and the Michigan Railway, as well as from points on the Detroit United Railway, to Chicago by way of Detroit, through Jackson, Battle Creek, Monteith Junction and Grand Rapids. At Grand Rapids connection is made with the Grand Rapids, Holland & Chicago Railway, which in turn connects with the Chicago boats at Holland and with the Grand Rapids, Grand Haven & Muskegon Railway at Muskegon. The western division of the Michigan Railway carries mail and express and handles steam-road mixed-freight cars, having a steam railroad connection with the Père Marquette Railroad at Allegan, the Grand Rapids & Indiana Railroad at Monteith, the Chicago, Kalamazoo & Saginaw Railway at Richland Junction and the Michigan Central Railroad at Battle Creek.

The lines of both the Michigan United Traction Company and the Michigan Railway are operated by the same management. The organization of the Michigan United Traction Company is as follows: President, B. C. Cobb; vice-president, Frank Silliman, Jr.; vice-president and general manager, J. F. Collins; secretary, G. B. Dobbin; treasurer, J. W. Glendenning; general superintendent, C. E. Morgan; superintendent of equipment, R. C. Taylor, and general superintendent of the steam road, H. D. Swayze. The organization of the Michigan Railway is as follows: President, H. H. Crowell; vice-president, B. C. Cobb; vice-president and general manager, J. F. Collins; vice-president, Frank Silliman, Jr.; vice-president, George W. Mechem; secretary, G. B. Dobbin; treasurer, J. W. Glendenning; manager of the northeastern division, A. D. Furlong; superintendent northeastern division, Charles Arnold; traffic manager of the western division, F. W. Brown, and superintendent of equipment, R. C. Taylor.

ANNUAL REPORT

American Light & Traction Company

The comparative statement of income, profit and loss of the American Light & Traction Company, New York, N. Y., for the years ended June 30, 1914 and 1915, follows:

	1915	1914
Earnings on stocks of subsidiary companies owned	\$3,980,302	\$3,697,743
Miscellaneous earnings	754,962	717,867
Gross earnings	\$4,735,264	\$4,415,610
Expenses	157,599	139,465
Net earnings	\$4,577,665	\$4,276,145
Surplus and reserve June 30, previous year	9,577,664	8,973,146
Total surplus earnings	\$14,155,329	\$13,249,291
Cash dividends on preferred stock	\$854,172	\$854,172
Cash dividends on common stock	1,553,332	1,408,727
Stock dividends on common stock	1,553,333	1,408,728
Total dividends	\$3,960,837	\$3,671,627
Surplus balance June 30	\$10,194,492	\$9,577,664

During the last fiscal year the gross earnings of the company increased \$282,559 or 7.6 per cent, most of which was made up of increased earnings on the stocks of subsidiary companies owned. The expenses increased \$18,134 or 13 per cent. The net earnings showed an increase of \$301,521 or 7 per cent. Dividends increased \$289,210 or 7.9 per cent, and the surplus balance (previous surplus included) \$616,828 or 6.4 per cent.

FARES COLLECTED IN CLEVELAND

The traffic returns of the Cleveland (Ohio) Railway thus far this year indicate in general very favorable results of operation. The following table shows the number of fares collected in each of the first eight months of 1914 and 1915, with the totals:

	1915	1914
January	18,431,753	18,816,541
February	17,052,978	17,046,893
March	19,527,042	19,100,804
April	19,391,440	19,296,216
May	20,359,602	20,434,647
June	20,455,054	19,647,477
July	20,829,989	20,216,303
August	20,669,652	19,796,084
Total	156,717,510	154,354,965

It will be noticed from the foregoing table that the total of fares collected for the first eight months of 1915 was 156,717,510, as compared to 154,354,965 for the corresponding period of 1914, an increase of 2,362,545. Six of the months showed increases (the lightest being in February and the heaviest in August) as follows: February, 6085; March, 426,238; April, 95,224; June, 807,577; July, 613,686, and August, 873,568. In January and May decreases of 384,788 and 75,045 respectively were shown.

BROOKLYN COMPANY WINS \$829,578 SUIT

Brooklyn, Queens County & Suburban Railroad Is Not Compelled to Pay City Percentage of Revenue Under Railroad Law

In a decision handed down in the Supreme Court on Oct. 2 Justice Erlanger held that New York City is not entitled to collect \$829,578 from the Brooklyn, Queens County & Suburban Railroad, Brooklyn, N. Y. This company is now one of the operating controlled companies of the Brooklyn Rapid Transit Company.

The suit, which has been going on since 1907, was brought under the railroad law to collect a percentage of the revenue received by the company from Oct. 1, 1901, to Sept. 30, 1907. The city's share of the earnings of \$7,029,105 for that period, according to the corporation counsel, was \$361,753. In addition, the city maintained that the company should have been penalized \$467,825 for failure to pay the amount due.

The present decision shows that by various consolidations the defendant company in 1893 came into possession of important lines in Brooklyn. These consolidations completed, the company effected an entrance into Manhattan by way of the Williamsburg and Brooklyn bridges. The city con-

tended that this brought the company within the statutory requirement for lines operating within a city of 1,200,000 or more inhabitants, although the population of Brooklyn at that time was less than the required figure.

Justice Erlanger holds, however, that the city is entitled only to franchise revenues and bridge tolls. If the railway were to be charged with the percentages on revenues under the railroad law the facts must indicate that it brought itself within the definition of the statute. To become chargeable because of an operation of cars within the Borough of Manhattan the defendant must be found to have operated a branch or extension of its line under the provisions of this statute. The company's cars, however, were run across the bridges by virtue of permits granted by the city, but there was no franchise given to the company by the city, because the State Legislature alone had that power. When thus operating its cars, under contracts with the city for payment of tolls, the railroad sought and obtained nothing under the provisions of the railroad law. It had a "privilege" or "license upon consideration," and it paid for what it received.

WINONA INTERURBAN PLANS READJUSTMENT

In Explanation of Recent Non-Payment of Interest on Bonds, Details Are Published of Financial Proposition Now Being Considered by Creditors

The report recently circulated in daily newspapers regarding the failure of the Winona Interurban Railway, Warsaw, Ind., to pay interest due on its first mortgage bonds was misleading. The company has under consideration a plan for reorganization, and pending the negotiations caused thereby it will not pay the coupons which matured Oct. 1, since a large amount of the bonds have already been deposited with the trustee.

According to an official statement recently issued, the Goshen division of the company, extending from Warsaw to Goshen and covering 25 miles of track, was opened for business in 1906. The Peru division, from Warsaw to Peru, 45 miles long, was put into operation in May, 1910. The company also leased from the Winona & Warsaw Railway in 1910 the line from Winona Lake to Warsaw, about 2½ miles.

Since the company began operations the gross receipts increased each year, except the last, about 10 per cent per year, but the increased cost of materials, supplies, maintenance and operation was so great that the net earnings did not increase accordingly. Consequently the company has not been able to earn its operating expenses and fixed charges. There is now an accumulated deficit of \$323,295, which has been covered by loans or the deferring of the collection of interest due.

In a desire to work out a plan whereby all creditors would ultimately receive full payment, the executive committee has been considering readjustment. The first plan, proposed more than two years ago, involved the organization of a holding company to which the claims of creditors would be sold for stock in the holding company to the amount of the claim. Such a company was organized under the name of the Securities Investment Company, and claims against the railway have been assigned to it and certificates of stock issued to the amount of \$851,455. While other creditors to the amount of more than \$100,000 have signified their willingness to transfer their holdings to the Securities Investment Company, it is not likely that the holders of claims to the amount of more than \$1,000,000 will consent to assign their claims on the plan proposed.

The executive committee has therefore prepared another plan, which, if adopted, will probably be accepted by the Securities Investment Company on the same terms as other creditors. The plan now submitted is that the company issue \$1,087,480 of consolidated first mortgage bonds and \$1,256,220 of second mortgage bonds, both being 5 per cent twenty-year issues. The first mortgage bonds would be secured by one mortgage on all the property of the company, instead of two mortgages, one on each division, as at present. The second bonds would be a junior issue, with the right of foreclosure for non-payment of interest restricted until a default occurs in first mortgage bond interest.

The issued \$750,000 of bonds on the Goshen division would be taken up on a basis of 60 per cent of par with the new first mortgage bonds and 40 per cent with the new second mortgage bonds at par, while the \$1,593,700 of bonds on the Peru division would be taken up by 40 per cent of first mortgage bonds and 60 per cent of second mortgage bonds. This discrimination is based on the better earning capacity and better bond worth of the former division. The present net revenues are said now to assure the payment of first mortgage bond interest.

The company has submitted this plan to its creditors with the statement that unless the holders of the bonds now outstanding consent to some plan which will insure the payment of bond interest on the present income, the company will be compelled to default on its interest payment, which will undoubtedly mean the ultimate disposal of the property at judicial sale.

Alton, Granite & St. Louis Traction Company, East St. Louis, Ill.—It is reported that the Illinois Public Utilities Commission has authorized the Alton, Granite & St. Louis Traction Company and the Alton Gas & Electric Company each to extend the date of \$250,000 bonds of the Alton Railway & Illuminating Company from Oct. 1, 1915, to Oct. 1, 1939. These bonds are underlying issues of the Alton, Granite & St. Louis Traction Company, the section for the Alton Gas & Electric Company representing bonds assumed by this latter company, which was once owned by the former.

Brooklyn (N. Y.) Rapid Transit Company.—The Central Trust Company, Kuhn, Loeb & Company and Kidder, Peabody & Company, New York, who financed the Brooklyn Rapid Transit Company subway requirements three years ago by the purchase of \$40,000,000 of six-year 5 per cent secured gold notes, have exercised the option then given to them by the company and have purchased the remaining \$20,000,000 of the notes under the \$60,000,000 issue. The proceeds are to be used in completing the construction and equipment required by the contracts between the city and the New York Municipal Railway Corporation, a subsidiary of the Brooklyn Rapid Transit Company. The notes are secured by the deposit with the Central Trust Company as trustee of the New York Municipal Railway Corporation first mortgage 5 per cent guaranteed bonds, equal in face value to the notes issued and outstanding from time to time, and \$10,000,000 of Brooklyn Rapid Transit Company refunding gold mortgage 4 per cent bonds. All the notes under this \$60,000,000 issue are convertible prior to Jan. 1 next into the New York Municipal Railway Corporation first mortgage 5 per cent bonds. Notes not converted will mature on July 1, 1918.

Choctaw Railway & Lighting Company, McAlester, Okla.—The Guaranty Trust Company, New York, N. Y., as trustee, has filed suit in the Federal Court at Muskogee to foreclose the mortgage of \$925,000 on the property of the Choctaw Railway & Lighting Company. A receiver is asked to take charge of the property.

Cleveland (Ohio) Railway.—Horace E. Andrews has resigned as a director of the Cleveland Railway.

Kansas City Railway & Light Company, Kansas City, Mo.—Chairman Dunham of the reorganization committee of the Kansas City Railway & Light Company has been advised by Federal Judge Hook that the time for deposit of the company's stock under the reorganization plan has been extended to Nov. 1; and of the various underlying bond issues, except Kansas City Elevated Railway and Kansas City & Westport Belt Railway issues, to Oct. 9. More than 90 per cent of the principal issues, and about 85 per cent of all interest-bearing securities, have been deposited.

Louisville (Ky.) Railway.—According to the report of the Louisville Railway for the first eight months of the year, the decrease in business was represented by a falling off in receipts of \$180,258. This loss, however, was nearly offset by careful management and curtailment of expenses, so that a reduction of only \$2,088 in surplus resulted. The decreased revenue for August was \$22,801, but operating expenses were cut down so that there was a small increase in net earnings. Figures for the first eight months of the year show the following: Gross revenue, \$1,940,703 (decrease, \$180,938); operating ex-

penses, \$1,024,437 (decrease, \$198,903); operating revenue, \$916,266 (increase, \$12,965); charges and taxes, \$596,396 (increase, \$16,729); net revenue, \$325,870 (decrease, \$3,764); other revenue, \$121,670 (increase, \$1,676), and net income, \$447,540 (decrease, \$2,088).

Memphis (Tenn.) Street Railway.—Out of the proceeds of the sale of \$1,500,000 of two-year 6 per cent collateral gold notes and \$600,000 of one-year 6 per cent guaranteed gold notes on a when-issued basis to bankers, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 2, 1915, there will be met maturities of \$1,000,000 of debenture notes on Nov. 1, 1915, and of \$906,000 of Citizens' Street Railway first mortgage bonds on Jan. 1, 1916, the balance going to working capital. The retirement of the Citizens' Street Railway first mortgage bonds will make the consolidated bonds of the Memphis Street Railway a first mortgage. The aforementioned two-year collateral notes are now being offered by Bertron, Griscom & Company, New York and Philadelphia; Reilly, Brock & Company, Philadelphia, and Counselman & Company, Chicago, at 99½ and interest to yield 6¼ per cent, while the one-year guaranteed notes have all been sold. These issues are to be dated Nov. 1, 1915.

New York (N. Y.) Railways.—A call for proxies to be voted at the annual meeting of the New York Railways on Dec. 6 has been sent out by a proxy committee representing holders of the company's adjustment income 5 per cent bonds. This is believed to indicate dissension among the five minority directors, the proxy campaign being leveled against the insurance company representatives because these companies had assented to adjusting the interest on the bonds by arbitration. The last arbitration award for the bond interest was noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 2.

Pekin (Ill.) Municipal Railway.—The Mayor of Pekin and the city clerk have been authorized by the City Commission to execute the \$4,000 of bonds previously unissued of the total of \$48,000 originally authorized by the city to provide funds to complete the reconstruction and electrification of the short local railway as a municipal enterprise. The Pekin Street Railway, which was organized in 1914 to rebuild the short existing line in Pekin but which on May 4, 1915, formally transferred the line to the city for municipal operation, has filed a dissolution notice with the Illinois Secretary of State.

San Diego (Cal.) Electric Railway.—The San Diego Electric Railway has filed with the California Railroad Commission an application for extending until Oct. 1, 1916, the time within which the company may issue \$577,000 of 5 per cent forty-year general first lien sinking fund gold bonds at not less than 85 per cent net. The commission authorized the company on Oct. 6, 1914, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 24, 1914, to execute a mortgage to the Union Trust Company, San Francisco, securing a possible maximum issue of \$10,000,000 of these bonds, and to put out thereunder \$4,497,000 of the issue. Up to now the company has issued \$3,920,000. The company's earnings decreased so materially during the last year, and the prospect of improvement is so doubtful, that it is deemed inexpedient to proceed with further extensions and improvements. As the time for the issue of the bonds was limited to Oct. 1, 1915, the company therefore asks another year's time for disposing of the bonds.

San Joaquin Light & Power Corporation, Bakersfield, Cal.—The California Railroad Commission has authorized the San Joaquin Light & Power Corporation to renew promissory notes for a total of \$91,481 for not more than one year from Dec. 31, 1915, with interest from 6 per cent to 7 per cent.

Wilmington Southern Traction Company, New Castle, Del.—Announcement has been made that the Wilmington & Philadelphia Traction Company, Wilmington, Del., has secured control of the Wilmington Southern Traction Company through the purchase of all the stock from the banking house of E. Clarence Jones & Company, New York. The transfer of control to these bankers was described in the *ELECTRIC RAILWAY JOURNAL* of Sept. 18. The company has a line about 6 miles long, running from Wilmington to New Castle. The purchasing company recently acquired the People's Railway in Wilmington, as noted in the issues of June

5 and June 12, and now has control of all the railway lines in the State with the exception of one running from New Castle to Delaware City. Negotiations are now on for this line. It is announced that a number of improvements will be made on the purchased line running to New Castle which will be one of the most important parts of the local system.

DIVIDENDS DECLARED

Boston (Mass.) Suburban Electric Companies, quarterly, 50 cents, preferred.

Cincinnati, Newport & Covington Light & Traction Company, Newport, Ky., quarterly, 1½ per cent, preferred; quarterly, 1½ per cent, common.

Citizens' Traction Company, Oil City, Pa., quarterly, 1½ per cent, preferred.

City Railway, Dayton, Ohio, quarterly 1½ per cent, preferred; quarterly, 1½ per cent, common.

Columbia Railway, Gas & Electric Company, Columbia, S. C., quarterly, 1½ per cent, preferred.

Dallas (Tex.) Electric Company, 3 per cent, first preferred; 2½ per cent, second preferred.

Lincoln (Neb.) Traction Company, quarterly, 1 per cent, common.

Manchester Traction, Light & Power Company, Manchester, N. H., quarterly, 2 per cent.

Ottumwa Railway & Light Company, Ottumwa, Iowa, quarterly, 1¾ per cent, preferred.

Rome Railway & Electric Company, Rome, Ga., quarterly, 1 per cent.

Scioto Valley Traction Company, Columbus, Ohio, quarterly, 1¼ per cent, first preferred; quarterly, 1¼ per cent, preferred.

Springfield & Xenia Railway, Springfield, Ohio, quarterly, 2 per cent, preferred.

Stark Electric Railroad, Alliance, Ohio, quarterly, three-quarters of 1 per cent.

United Railways & Electric Company, Baltimore, Md., quarterly, 50 cents, common.

Virginia Railway & Power Company, Richmond, Va., quarterly, 1½ per cent, common.

Traffic and Transportation

JITNEY JOTTINGS

Letter from New York Commission to Mayors and District Attorneys on Jitney Status

In view of the many complaints which have been lodged with the Public Service Commission for the Second District of New York against alleged illegal jitney bus lines the commission on Oct. 3 transmitted to the Mayors and District Attorneys of the State a notice calling their attention to the fact that the decisions of Justices Brown and Hasbrouck, sustaining and defining the jitney law passed by the last Legislature, bring practically all bus lines, wholly or partly in any city, within the scope of this statute. The commission says:

"In the light of these decisions and the drastic nature of the statute, it is the hope of this commission that, with the aid of the local authorities and the district attorneys, all persons operating in contravention of the statute shall upon this notice at once cease such operations and not resume the same until properly authorized by the local authorities and by this commission."

Information has reached the commission that bus lines are operating in practically all the cities of the State without the proper authorizations under the court interpretation of the law. Complaints, formal and informal, reach the commission almost daily, necessitating in each case an individual show cause proceeding, and a possible resort to the courts for an injunction. It was pointed out at the office of the commission on Oct. 3 that an application for a certificate of convenience and necessity can be handled far more readily than the proceedings for violations of the law, and it was said that the notice was to induce jitney operators to take this course or to cease operation rather than lay themselves open to proceedings for violation.

The letter of the commission to the Mayors and District Attorneys was as follows:

"By direction of the commission, your attention is herewith respectfully directed to these circumstances with regard to the enforcement of Chapter 667 of the laws of 1915, the so-called jitney bus statute:

"Mr. Justice Brown, of the Supreme Court in Niagara County, has decided in the case of Public Service Commission, Second District, vs. Burt G. Hurtgam, that all of the following classes of vehicles come within the scope of this statute and must secure consents from the local authorities and certificates of public convenience and necessity from this commission for operation wholly or partly within any city of the State: (a) a bus line; (b) a stage route; (c) a motor vehicle line or route; (d) a vehicle in connection with a bus line, a stage route, a motor vehicle line or route; (e) a vehicle carrying passengers at a rate of fare of 15 cents or less for each passenger within the limits of a city; (f) a vehicle carrying passengers in competition with another common carrier which is required by law to obtain the consent of the local authorities of said city to operate over the streets thereof.

"Mr. Justice Hasbrouck of the Supreme Court in Albany County in the case of Public Service Commission, Second District, vs. Elmer G. Booth, has held that the possession of a city license, granted previous to the taking effect of Chapter 667 of the laws of 1915, does not exempt the holder of such license from compliance with the chapter to which reference is made. You will thus observe that practically all of the so-called jitney lines which have not secured local consents and the certificate of this commission under the provisions of Chapter 667 are operating in violation of law. In view of these decisions and of the drastic nature of the statute, it is the hope of this commission that, with the aid of the local authorities and the District Attorneys, all persons operating in contravention of the statute will, upon this notice, at once cease such operation and not resume the same until properly authorized by the local authorities and by this commission."

The most lengthy hearing thus far allowed in any of the jitney suits for an injunction to restrain the Philadelphia police from enforcing the ordinance of Councils passed

in July was presided over by Judge Patterson in Common Pleas Court a few days ago. Statistics, distances and averages were entered upon the record to prove the jitney operators' contention that it is impossible to engage in the business at a profit while complying with the provisions of the recent ordinance. One operator now running a car under the ordinance testified that after paying for gasoline, tires, oil, garage charges, repairs to his car, etc., he was losing about \$5 a day. Before the ordinance went into effect, he said, his profits were always more than \$5 a day. Two other men who ran higher priced cars before the enforcement of the ordinance also submitted some figures showing that by traversing the routes designated in the ordinance for a 5-cent fare, they would run their cars at a loss. Assistant City Solicitor Wolff frequently interposed objections to the testimony of the complainants' witnesses on the ground that the only allegations to fact which the bill in equity raised were whether or not the ordinance was confiscatory. Mr. Wolff declared that all the other allegations were based on questions of law and were matters for argument and cannot be decided by means of testimony. Judge Patterson, however, allowed the complainants' attorney every latitude in the presentation of his case. The case will likely be decided in a written opinion.

The Philadelphia police will begin an active crusade against the automobiles run on Broad Street under the direction of the Peoples' Motor Club. Director of Public Safety Dripps issued an order calling upon the police department to enforce the jitney ordinance as passed by Councils and arrest all drivers save those who have complied with that ordinance by depositing a license fee of \$5 and a liability bond of \$2,500. According to the president, Paul Randolph, the People's Motor Club was acting under advice of counsel, who told the company it could operate as a private club and not be amenable to the ordinance which Councils passed last July. By issuing a membership card and selling with it for 25 cents a strip ticket good for five rides, the club contended it was operating within the law as a private agency, and, therefore, not liable to prosecution under the provisions of the ordinance. City Solicitor Ryan advised the Director of Public Safety that the People's Motor Club plan is an evasion of the law, and he pointed out that the police should proceed against the drivers of the "club." The officers of the People's Motor Club said that their 115 or more cars would operate to test the law and that a plan of action to meet such an emergency had been decided upon some time ago.

On Oct. 15 the Ferry Line Auto Bus Company will begin the operation of auto buses throughout West Seattle, the buses to connect with the ferry owned by the Seattle Port Commission. Passengers will receive transfers to and from the buses and the ferry, and the transportation company and Port Commission will share the proceeds on a 60 per cent and 40 per cent basis. The Ferry Line Auto Bus Company has provided five motor buses, capable of carrying a total of 250 to 300 people. Some of the buses will operate west on Alki Avenue, while the remainder will traverse California Avenue. The present service is to be maintained over the most practical route. As other streets are improved, the auto bus company will provide connecting service within a reasonable distance from the ferry landing. The Port Commission has agreed to charge a straight 5-cent fare on the ferry, and to give the passenger an option of transfer to the auto bus if he calls for it. In case such transfer is called for and used the auto bus company will receive 3 cents of the 5-cent fare, and the Port Commission the remaining 2 cents. The auto bus company has provided itself with a \$50,000 indemnity bond, \$10,000 on each bus, and will forfeit \$5,000 to the Port Commission if the service is not maintained as agreed.

The jitney regulation by-law as returned by the City Council of New Westminster, B. C., to the city solicitor for re-drafting, provides for a bond of \$2,000, to be put up by jitney drivers, to cover their liability in case of accident. This will apply also to drivers of autos for hire in the city other than jitneys. It does not apply to cars on the interurban run between Vancouver and New Westminster, which are covered by a \$5,000 bond in Vancouver. The license fee was fixed at \$10 a year for each vehicle.

RESTRAINT OF JITNEYS IN TERRE HAUTE—HEARING IN U. S. DISTRICT COURT

The hearing in the case of the Fidelity Trust Company, Philadelphia, Pa., trustee under the mortgage of the Terre Haute, Indianapolis & Eastern Traction Company, against jitney-bus drivers of Terre Haute, Ind., was held before Judge Arthur B. Anderson in the United States District Court at Indianapolis, Oct. 4. The complaint was made in the bill that the jitney-bus drivers were operating without any license, permit or other form of regulation, unlawfully competing with the street railway lines in Terre Haute and depriving them of revenues to which they were entitled under franchise rights.

Attorneys for the jitney drivers sought to have the bill dismissed on the grounds of insufficiency and because it was multifarious, but this was refused by the court. In their opening argument they contended that while the jitney bus was a common carrier, and, as a common carrier, subject to regulation, they denied that a franchise was necessary to operate over the highways. They contended that the State had the necessary police powers of regulation over all common carriers, and that the operation of any common carrier, whether under franchise or not, was subject to such regulative authority.

Judge Anderson stated that he believed the question to be decided by the court was whether the jitneys had the right to operate over the streets of Terre Haute, and if they had this right, whether in the present case they were operating unlawfully. If they were operating in an unlawful manner as charged in the bill, even if they were operating under a franchise ordinance granted by the city, he could restrain them.

Counsel for the plaintiff read affidavits to the effect that the jitneys stood in an unbroken line along Wabash Avenue, Terre Haute, preventing ingress or egress from the sidewalk to the cars in the center of the street; that the jitneys ran in front of the cars which had stopped for passengers waiting for the cars; that the lives of citizens were endangered by the reckless running of jitneys. James M. Gossom, Mayor of Terre Haute, also made affidavit that the merchants along Wabash Avenue had complained that the jitneys were interfering with their business by blocking the street along the curb. The Mayor's affidavit stated that orders had been given that a space of 20 ft. should be left between jitney buses, and that he thought some regulation was necessary. Newspaper editorials and articles were introduced by the plaintiff to show that the central labor union and other bodies had agreed to combine and by concerted action divert travel from the street cars to the jitneys.

Ferdinand Winter, attorney for the plaintiff, sought to show that the right to take tolls and use the public highways for private gain was a franchise, and that the State could not grant a franchise unless some consideration was given, either in the way of an obligation to perform service under specified conditions or in some other form. He stated that the appeal of the company to the Public Service Commission of Indiana some months ago had been denied because the commission did not consider that under the utility act it had jurisdiction over the jitneys, but suggested the company might seek remedy in the courts.

Attorneys for the defence argued that the fare charged by the jitney was an agreed fare for a service rendered by the owner of the automobile and was not a toll for the use of the highway, and was no more subject to franchise conditions than the transfer of a person's household goods over a highway.

Judge Anderson, in summing up the case, stated that the plaintiff had not conclusively shown that there was a physical interference with the operation of its cars. He did not believe that the evidence introduced showed what would be termed a boycott of the street railway lines. The court could not shut its eyes to the fact that there were differences between the company and organizers of labor. There was a combination to "not help the company," but as the court understood the case, that combination had not been shown to be unlawful. The judge stated that the matter devolved upon whether the court had the right to enjoin the defendants because they were operating without a franchise, while the company has built tracks, operates cars, etc., under a

franchise and the payment of interest on its mortgage to the plaintiff was dependent upon its ability to collect fares on its cars. The court thought that the jitney-bus drivers should operate under a franchise or grant, but that was a matter which concerned the State, and if the State did not choose to impose such regulation it was not within the province of the court to do so. The judge stated, however, that he would take the matter under advisement, and asked the attorneys to leave their briefs pending the decision of the court.

LOCKPORT SWITCHING CASE DECIDED

New York Central and International Railway Ordered to Provide Switching Facilities at Lockport—Case Before Commission Since 1908

In an opinion by Commissioner Devoe P. Hodson, the Public Service Commission of the Second District of New York has decided the long-pending Lockport interchange case, and has ordered the New York Central Railroad and the International Railway to provide facilities for the switching of freight between the two roads in Lockport. This service must be put into effect on or before Oct. 15. The two railroads are permitted to prepare their own plans and enter into their own agreements, which must be submitted to the commission for approval, including a reasonable switching tariff for such service involved. If these agreements are not made and the service not put into effect before the date set, the commission will enter a final order compelling the performance of the work in detail.

This is the oldest case before the commission, having been filed in December, 1908, and it is the first time that the commission has ordered an interchange of freight between two railroads in the State. Commissioner Hodson ascribes the long delay in disposing of the case to the fact that a number of similar cases were pending in the courts and commissions of other States, and that a case parallel to this has only recently been decided by the United States Supreme Court.

Commissioner Hodson bases his opinion on three points: that the present service is unreasonably inadequate, inconvenient and expensive, as well as possibly discriminatory; that carriers are compelled under Sec. 35 of the public service commissions law to interchange freight and passengers, and that the commission has power, through Sec. 19 of the law, to enforce this requirement; and that neither the law nor an order to enforce it will be confiscatory following the just rendered decision of the United States Supreme Court in a similar case which came to it from the Michigan Railroad Commission.

The New York Central Railroad objected to the installation of interchange facilities at Lockport because it maintained that the interchange facilities between its lines and those of the Erie Railroad and the International Railway at Suspension Bridge, North Tonawanda, East Buffalo, Batavia, Attica and other points afforded proper facilities. The Erie Railroad and the International Railway, which leases the line of the Erie into Lockport, alleged that it was a condition of the lease between the two that no road other than the Erie should participate in freight originating on its line leased to the International Railway. Of this Commissioner Hodson says:

"A remarkable feature of this case appears to be that the city of Lockport, which is a municipality of considerable size and commercial importance, and contains more extensive manufacturing plants than are usually found in cities of its class, should be discriminated against by the railroad companies by denying to the industries of that city the same privileges for promptly shipping and receiving freight which other communities are afforded. * * * So far as the decision of the New York Central Railroad is concerned, Lockport cannot have any interchange of freight between that company and the Erie Railroad unless it avails itself of the privilege of going to North Tonawanda, Suspension Bridge, East Buffalo or Batavia for that purpose. While the International Railway, operating the Erie Railroad, denies the right of Lockport for interchange of freight from its line because, forsooth, it has an agreement with the Erie Railroad that no other road shall participate in business originating upon such leased line."

The opinion shows that when a car of freight arrives in Lockport on one road, consigned to a plant on the other road, the consignee must either unload and haul the contents privately across the city, or must allow the car to be hauled 14 miles back to North Tonawanda, there switched to the other road and hauled 14 miles again to his plant, subjecting him not only to this delay, but to a switching charge of upward of \$30. The opinion says:

"The argument of the carriers that this practice is even reasonably good service is entirely without merit, especially in view of the fact that every opportunity for such interchange—just the same as is afforded at North Tonawanda at large expense of time and money—is at hand in Lockport. It has been shown in this case by an abundance of proof, and it stands uncontradicted, that there are several places in both the upper and lower parts of the city of Lockport where these two railroads could be joined by a switch, and where there are ample and sufficient opportunities to have sufficient storage tracks to hold all the cars which might be placed there at any one time for delivery from one road to the other, either of outgoing or incoming freight, and at an expense for construction and maintenance which would be insignificant in comparison to the advantages which would be gained by everybody concerned; and in procuring any one of these sites the city officials of Lockport and the commercial bodies of the city stand pledged to assist the railroads in the acquirement of necessary private property as well as the right to cross or use the streets.

Commissioner Hodson points out that there are at the present time plants in Lockport which enjoy practical interchange because they are located contiguous to both roads. Not only this, but in some cases the tracks of the two roads are physically connected at these plants and the steam locomotives of the New York Central Railroad and the electric locomotives of the International Railway haul cars over the same tracks to and from these plants. In this connection Commissioner Hodson said:

"It is difficult to find justification for a practice which guarantees every desirable facility of a public utility to a few shippers in a community and denies the same privileges to all others; besides, such course is in contravention of Sec. 32 of the public service commissions law, which prohibits unreasonable preference on the part of carriers."

Speaking of the unwillingness of the railroads to grant this interchange through fear that one or the other may gain an advantage not now existent in the handling of the Lockport business, Commissioner Hodson says:

"The underlying theory of the respondents as to their freight service in Lockport seems to be the maintenance of competition, while the complainants seek to invoke the more modern theory of regulation. * * * However this may be, it now becomes the duty of the commission, regardless of what has gone before, to make a declaration of the rights and obligations of both shippers and railroads with reference to these matters, and in such declaration to show, if possible, that the interests of the parties are mutual and not antagonistic; and if we can do that we have gone a long way toward proving the efficacy of regulation in the interest of the public and the carriers themselves.

"Both carriers seem to forget that they have no prescriptive right to the freight business at Lockport, but are only common carriers who may or may not be employed to transport such freight and that the shippers have something to say as to which railroad the business belongs."

Commenting on the fact that the clause in the International-Erie lease confining the International Railway switching to Erie business qualified by the phrase "unless required by law to do so," Mr. Hodson says:

"Apparently these contracting parties recognized the probability that necessity would some day arise for the switching freight cars from other lines than the Erie Railroad, and that the International Railway would be required to perform such additional service, when the clause above quoted was made a part of the contract. * * * The time has arrived when the law should require such special switching service to be extended and made general in accordance with the demands of the complainants. There cannot be any element of justice in a rule which permits the carriers to continue their present plan of freight interchange for the industries of Lockport."

NEW RULE ON GROUP FARES IN LOUISVILLE

Ever since the pay-as-you-enter system of collecting fares has been in vogue, the management of the Louisville (Ky.) Railway has been considering means by which it might be possible to eliminate chances of losses easily resulting through the practice of one person paying the fares for all members of a group that boards a car at the same time. In an effort to reduce the chances of loss the company has posted the following notice in its cars and elsewhere:

"IMPORTANT—To save time and prevent mistakes, persons paying fare for others will board car first and deposit fare, indicating to conductor those following for whom fares have been paid."

The newspapers took the matter up, and Samuel Riddle, superintendent of transportation, was quoted as follows:

"We have sixteen lines in Louisville, and we make 18,000 half trips daily. Now suppose we lose an average of one fare on each trip. That is 18,000 nickels, or a total of \$400. Three hundred and sixty-five times \$400 equals \$146,000 a year. Now the corporation which protects its revenue makes the investments of its stockholders safe. Hence the rule."

In response to queries as to whether the man should climb aboard first, leaving his wife to get on as best she could Mr. Riddle suggested that this was not necessary; that she might wait on the platform for him or he could follow close behind and so not cause any delay or crowding. In this connection he was reported to have said:

"We are not aiming at the time-honored custom of men helping women aboard, but we are simply requesting the co-operation of our patrons in eliminating disputes between conductors and passengers and delays resulting therefrom and in keeping the company on a sound business basis in order to give everybody his money's worth."

"Near Side" Stop in Albany.—The United Traction Company, Albany, N. Y., has announced that it will put the "near side" stop in effect on its lines in Albany on Nov. 1.

Accidents Reduced in Dallas.—Accidents on the Dallas (Tex.) Consolidated Electric Street Railway for the last twelve months have decreased 41.2 per cent over the preceding year. This gratifying result is attributed directly to the carefully planned safety-first campaign. Among the more radical changes incident to this campaign is the adoption of platform doors and folding steps.

Louisville Public Thanked.—Cards are being displayed in all of the cars of the Louisville (Ky.) Railway expressing the appreciation of the company for the co-operation given by the public during the year just passed in the way of preventing accidents. During the first year the safety-first movement was in effect not a death resulted from injuries in which the company's cars were involved, while accidents were reduced by one-half or better..

One-Man Car Service Upheld by Court.—Justice L. E. Wagelin at Belleville, Ill., has decided that the City Council of that city had no right to compel the company to place two men on all city cars operated by the East St. Louis & Suburban Railroad. The justice held that all such matters of the operation should be settled by the Public Utility Commission rather than be passed upon by the Councils of the various cities of the State. The city has announced an appeal.

"Near Side" Stop and One-Man Cars in Spokane.—C. S. MacCalla, general manager of the Washington Water Power Company, Spokane, Wash., states that when the new cars of the company designed for front entrance are placed in general use the "near side" stop will be adopted exclusively. Where traffic conditions permit, the new cars will be operated as one-man cars. On the Cannon and the North Division Street routes, two stub lines, which connect with through lines, the company has already installed the one-man system.

Schedule of Increased Fares Filed.—Schedules providing for the establishment of a 6-cent fare unit on the entire system have been filed by David A. Belden, president of the Massachusetts Northeastern Street Railway, Haverhill, Mass., at the offices of the Massachusetts and New Hamp-

shire Public Service Commissions and the Interstate Commerce Commission. Minor changes in fare zones are also contemplated. The company operates in the Merrimac Valley cities and towns of Massachusetts, in southern New Hampshire and along the coast of Massachusetts and New Hampshire, and is closely affiliated with the central station interests of Portsmouth, N. H., where the main generating plant of the system is located.

Trenton Fare Case Before Court.—The United States District Court heard argument on Oct. 4, on the application made to it for an injunction to restrain the Board of Public Utility Commissioners of New Jersey and the city of Trenton from interfering with the elimination by the Trenton & Mercer County Traction Corporation of its six-for-a-quarter tickets. The decision of the court has not been announced. The hearing under the order adopted by the Board of Public Utility Commissioners suspending the increased rates, which had been continued until Oct. 5, was continued on Oct. 5 until Oct. 19, without the submission of testimony. This continuance was ordered because of the proceedings pending before the United States Court.

At-Your-Service Car in Seattle.—The Puget Sound Traction, Light & Power Company, Seattle, Wash., at the suggestion of A. L. Valentine, superintendent of public utilities of the city, has installed a short car line, which will be continued in operation until the completion of the Fremont Avenue Bridge. Patrons who require the service of the car press a button at either terminus of the line, and the car hurries to the waiting passenger. Signs "Push the Button if You Want a Street Car" are posted at the Stone Way Bridge and the Fremont Avenue Bridge. The car that furnishes this personal service operates on Westlake Avenue North, between Stone Way and Fremont Avenue, a distance of about ten blocks. The car seats about thirty-two passengers. The motorman collects the fares, issues transfers and dispenses information regarding the schedules of the connecting cars.

Toronto Car Order Entered.—The Toronto (Ont.) Railway must proceed with the construction of twenty-five cars upon the plan recently tried out on College Street of cross-seats on one side and a longitudinal seat on the other. The company got its orders on Oct. 1 from the Ontario Railway & Municipal Board following a conference between the board and the city and company representatives. The decision of the board was opposed by R. J. Fleming, manager of the company, who declared that the company was being asked to spend a large sum of money for converting its cars at a time when traffic was falling off and many cars were idle in the carhouses. Commissioner of Works Harris thought that the present was the most suitable time for putting on the new type cars, since traffic would be heavier during the winter time. The order requires the company to have the twenty-five cars in service by Dec. 1.

What the Public Leaves Behind It.—The Glasgow (Scotland) Corporation Tramway has tabulated in its recent pamphlet report the articles left behind in the cars for the years ended May 31, 1914, and May 31, 1915, by thoughtless passengers. The articles are classified under twenty heads, namely, umbrellas, parcels, bags, purses, baskets, gloves, books, parcels of clothing, sums of money, keys, walking sticks, boxes, tools, jewelry, spectacles, furs, coats and waterproofs, music, watches and miscellaneous. The total number of articles found in the cars for the year ended May 31, 1915, was 31,287 as compared with 32,766 for the previous year. Of these totals 16,813 articles were claimed in 1915 against 16,599 claimed in 1914, while 14,474 remained unclaimed in 1915 as compared with 16,167 unclaimed in 1914. Naturally the umbrella leads. In 1915 4776 umbrellas were left behind as compared with 4665 in 1914. It seems almost incredible but 605 sums of money were left behind in 1915 as compared with 743 in 1914. In 1915 thirty-eight people were so careless as to leave watches behind while in 1914 forty-eight people left their watches on the cars. The figures are fairly consistent for the several months of the year except for the seasonable articles such as furs and coats and waterproofs, which naturally predominate in the winter months.

NEW PRESIDENTS OF THE ASSOCIATIONS

Brief biographical sketches and portraits are appended of Mr. Charles L. Henry, the newly elected president of the American Electric Railway Association; Mr. H. A. Nicholl of the Traffic & Transportation Association; Mr. George Carson, of the Claims Association; Mr. John Lindall, of the Engineering Association; Mr. Thomas Finigan, of the Manufacturers' Association, and a biography of Mr. T. P. Kilfoyle, of the Accountants' Association.

Mr. Charles L. Henry, the newly elected president of the American Electric Railway Association, has been for twenty-five years a leading figure in the development of the extensive system of interurban lines radiating in all directions from Indianapolis, the success of which exercised a tremendous influence in encouraging the construction of long electric interurban lines elsewhere. Mr. Henry is credited with having originated the term "interurban railway," which was coined and applied to the new lines at Indianapolis soon after their operation began. This venture, it may be said, was the beginning of the now famous Union Traction Company of Indiana, which was formed in 1899 to combine the several electric railways that had sprung into being following the success of Mr. Henry's pioneer line from Anderson to Alexandria. Subsequently, as general manager of this company, Mr. Henry constructed the lines from Muncie to Indianapolis, forming the backbone of the system as it exists to-day. Several years ago, however, he disposed of his interest in the company to form the Indianapolis & Cincinnati Traction Company, notable as one of the earliest successful single-phase systems in the country, as well as for a number of innovations along technical lines that have been brought to perfection through their adoption by the railway of which Mr. Henry is president and general manager. In spite of receiving an education for the legal profession Mr. Henry has shown keen judgment in engineering matters. He was graduated from the law school of Indiana University in 1872, when he was twenty-three years of age, and he practised law in Pendleton, Ind., and Anderson, Ind., until he began his connection with the street railway industry nineteen years later. During this period he served for four years in the Indiana State Senate, subsequently being elected for two terms as a Representative in Congress. It was not until 1891 that he became actively interested in railway matters, his first venture being the purchase of the horse car line in Anderson which he electrified soon afterward. Ever since his entry into the industry Mr. Henry has taken a prominent part in electric railway association work, being president of the Central Electric Railway Association at the present time and having served as vice-president of the American Association since 1911. All of Mr. Henry's activities during his long and successful career have centered in or about Indiana, his native State, but his every instinct is that of the pioneer who avoids the beaten trails. Of his personality perhaps its best characterization, in the opinion of his many friends, is that contained in a testimonial presented to him at the last convention by his fellow members of the National Joint Committee on the Joint Use of Poles. It said: "Charles Lewis Henry, loved by us all for his unflinching delightful personality, consummate tact, nice discernment and ready power of appreciating and doing that which is required, is hereby elected to the degree of engineer of good will."

Mr. H. A. Nicholl, who was elected president of the American Electric Railway Transportation & Traffic Association, is general manager of the Union Traction Company of Indiana, Anderson, Ind., which embraces more

than 400 miles of line. Mr. Nicholl has been engaged in electric railway work for a number of years, but derived his earlier railroad experience with steam roads. After completing schooling he became connected with the construction engineering corps of the Chicago & Northwestern Railway and later served with the operating department as baggageman. Subsequently he became successively assistant secretary and treasurer of the Natchez, Jackson & Columbus Railway and station agent of the Louisville, New Orleans & Texas Railway, both of which now form part of the Illinois Central Railroad; and finally, served in the Illinois Central Railroad's general freight department at Chicago. Mr. Nicholl began electric railway work as superintendent of the North Chattanooga Street Railway and Chattanooga & North Side Railway, Chattanooga, Tenn., and was later made vice-president and general manager. He subsequently became associated with the Rochester (N. Y.) Railway as superintendent of power and purchasing agent, and at the same time was superintendent of construction of the Rochester & Sodus Bay Railway. After this time he served successively in the following positions: general manager of the Taunton (Mass.) Street Railway; general manager and treasurer of the Ithaca Street Railway and Brush-Swan Electric Light Company, Ithaca, N. Y.; general manager Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio. Since April 15, 1905, Mr. Nicholl has been general manager of the Union Traction Company of Indiana.

Mr. George Carson, the new president of the American Electric Railway Claims Association, is claim agent of the Puget Sound Traction, Light & Power Company, Seattle, Wash. Mr. Carson was born in Ireland. He arrived in New York City when seventeen years old and secured employment as a horse-car conductor. In 1883 he became a conductor with the old Chicago West Division Railway and was advanced rapidly, filling in succession the positions of conductor, receiving clerk, carhouse foreman, division superintendent and claims adjuster of the company. While attached to the claims department of the Chicago West Division Railway he studied law and was graduated in 1891 from the Chicago College of Law, the Law Department of Lake Forest University. He was admitted to the Bar and practised law in Chicago from 1891 to 1893. Mr. Carson went to the Pacific Coast in the latter year and from that date until 1900 was employed almost continuously in the law and claims department of the Southern Pacific Company and the old Market Street Railway, San Francisco. The latter com-

C. L. HENRY

H. A. NICHOLL

GEORGE CARSON

pany controlled nearly all the street railway lines in San Francisco at that time. For a year and a half prior to 1900 he had supervision of all the damage suit litigation for both companies. In 1900 Mr. Carson went to Nome, Alaska, and took an active part in the mining litigation going on there at that time. In October, 1901, he entered the service of the Seattle (Wash.) Electric Company as a conductor. He was promoted the following March to the position of inspector of the old Pine Street carhouse in charge of operation of all of what was known as the downtown lines, comprising about three-fourths of the system at that time. He continued in

charge of operation of different divisions of the company until May, 1908. He was then promoted to his present position as claim agent of the company. In 1908 Mr. Carson was admitted to practice as an attorney in Washington. He was one of the organizers of the Pacific Claim Agents' Association, formed in Portland, Ore., in 1909, and served as president of that association 1912-1913. Mr. Carson is the originator of safety committee organizations as applied to electric roads, organizing the first safety committees in 1911. He has been chairman of the central safety committee of the Puget Sound Traction, Light & Power Company since the organization of the safety committees. In 1912 he was one of the organizers of the Pacific Claim Agents' Index Bureau, in Los Angeles, and has been president of the bureau since 1913.

Mr. John Lindall, the newly elected president of the American Electric Railway Engineering Association, is superintendent of rolling stock and shops of the Boston (Mass.) Elevated Railway. Mr. Lindall entered the railway field as a conductor in June, 1889, with the West End Street Railway, Boston. He served one year as conductor and two years as starter, during which time the horse cars were replaced by electric cars. In 1892 he was transferred to the mechanical department of the same company as a car repair man, serving on the different classes of such work until 1895, when he was appointed as carhouse foreman, which position he held in various carhouses of the company until

JOHN LINDALL

THOMAS FINIGAN

January, 1901, when, upon completion of the elevated lines by the Boston Elevated Railway, successor to the West End Street Railway, he was appointed general foreman of elevated shops, and given charge of the work of equipping cars for the elevated service and their maintenance after they had been put into service. In May, 1905, he was promoted to the position of assistant superintendent of motive power and machinery and given charge of both surface and elevated car equipment. In October of the same year he was again promoted to the position of superintendent of motive power and machinery, in which position he was in charge of the company's power stations as well as rolling stock. Owing to the increase and extension of the work in this department, the power station work was separated from that of the rolling stock, and in December, 1907, Mr. Lindall received the title and position of superintendent of rolling stock and shops. During the installation and early development of the equipment for elevated and tunnel lines in Boston, many new and untried conditions were met in the then new branch of railway industry. In working out these problems, Mr. Lindall developed a genius for invention that has resulted in many improvements in car equipment. Mr. Lindall is a member of the American Electric Railway Association, New England Railroad Club, New England Street Railway Club, and American Institute of Electrical Engineers.

Mr. Thomas Finigan, who has been elected president of the American Electric Railway Manufacturers' Association, is vice-president of Pierson, Roeding & Company, San Francisco, representatives for manufacturers of street railway supplies, with branches in Los Angeles, Cal., Portland, Ore., and Seattle, Wash. Mr. Finigan entered the employ of the Consolidated Traction Company, Newark, N. J., now the

Public Service Corporation, in 1898, and was advanced rapidly to the position of assistant master mechanic. He resigned from the company to become associated with the mechanical department of the United Railroads, San Francisco, in 1903. He took entire charge of the commissary department created by the United Railroads to meet the unusual conditions arising from the earthquake and fire of 1906 and the strike in 1907 when the company fed and cared for more than 2000 employees. In the latter part of 1907 he was appointed purchasing agent of the company and continued in that capacity until June, 1913, when he was elected an officer of Pierson, Roeding & Company. Mr. Finigan has served on various committees of the American Electric Railway Association and acted for a time as secretary for the Pacific Coast Electric Railway Association following its organization.

Mr. T. P. Kilfoyle, auditor of the Cleveland (Ohio) Railway, was elected president of the American Electric Railway Accountants' Association on Oct. 6. Mr. Kilfoyle has been first vice-president of the accountants' association for two terms, and has served in other years on the executive committee of the association. He has been auditor of the Cleveland Railway since March 1, 1910, and previous to that time was connected with the auditing department of the company for a number of years except during the short interval while the Cleveland Electric Railway was being operated by the Municipal Traction Company during the administration of former Mayor Tom L. Johnson. Prior to the time when he became connected with the Cleveland Railway, Mr. Kilfoyle was general auditor for the Warren Bicknell Company, Cleveland, Ohio, which operated the Cleveland, Lake Shore & South Bend Railway, the Youngstown & Ohio River Railway and the Springfield & Xenia Railway. Mr. Kilfoyle has been connected with the street and electric railway business for the last eighteen years. He was born in Cleveland on June 28, 1868.

Personal Mention

Mr. R. C. De Frees, formerly assistant engineer on the forces of the Interurban Railway, Des Moines, Iowa, has been appointed computer for the Interstate Commerce Commission, Division of Valuation, Karpen Building, in the city of Chicago.

Mr. Byron T. Burt, vice-president of the Rutland Railway, Light & Power Company, Rutland, Vt., has assumed the duties of general manager of that company in addition to the office of vice-president. Mr. Burt was formerly general manager of the Chattanooga River & Power Company, with headquarters at Chattanooga, Tenn.

Mr. Horace E. Andrews has withdrawn as a director of the Cleveland (Ohio) Railway. His resignation was accepted at the monthly meeting of the directors on Sept. 25. It is said that the resignation has been in the hands of Mr. J. J. Stanley, president of the company, for several weeks. He retired because he is now a permanent resident of New York and therefore is unable to take an active part in the company's affairs. Mr. Andrews first became interested in street railway affairs in Cleveland when he was made a director of the Broadway & Newburg Railway in 1886. He served in this capacity until the organization of the Cleveland Electric Railway in 1893. For many years he was president of that company. His part in the franchise negotiations with the city of Cleveland during the Johnson administrations forms an interesting chapter in street railway history.

OBITUARY

Gustave C. Kuhlman, founder of the G. C. Kuhlman Car Company, Cleveland, Ohio, died at his home in that city on Sept. 4, after an illness of several months. The car manufacturing business of the Kuhlman Company was started in a small shop on St. Clair Avenue, Cleveland, in 1881. When electric power was introduced the business was expanded and the factory was moved to the old carhouse at Broadway and Aetna Road. Later on the shops at Collinwood were built. In 1903 Mr. Kuhlman sold his interests to The J. G. Brill Company. Since his retirement from the company Mr. Kuhlman has been the northern representative of the Martindale Mercantile Agency.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***North Arkansas Utilities Company, Corning, Ark.**—Incorporated in Arkansas to construct and operate a power plant, railways, etc. Capital stock, \$75,000. It is not contemplated to build a railway for possibly eighteen months. Incorporators: George A. Booser, C. L. Daniel, Elizabeth Morrison, H. B. Hays and Thomas Neely.

Torrington (Conn.) Traction Company.—Incorporated in Connecticut to construct a line between Torrington and Thomaston. Capital stock, \$300,000. Officers: Hosea Mann, Torrington, president; Howard M. Guernsey, Thomaston, vice-president; E. M. Canfield, Hartford, secretary, and George B. Goodwin, Torrington, treasurer. [Jan. 2, '15.]

***Kinston (N. C.) Belt Line.**—Incorporated in North Carolina to construct a belt line of steam railroad around Kinston and an electric line through the city streets to carry both passengers and freight. Capital stock, \$25,000. Incorporators: J. T. Deal, M. L. German, W. S. Spottswood and G. V. Cowper.

FRANCHISES

Los Angeles, Cal.—The Pacific Electric Railway has received a franchise from the Council to construct and operate a single-track line on certain portions of Figueroa Street, Denver Avenue, Hoover Street, Menlo Avenue and Vermont Avenue.

Belvidere, Ill.—A new franchise for the Elgin & Belvidere Electric Company has been passed by the Council of Belvidere. The city service in Belvidere is to be abandoned, and the tracks on West Lincoln Avenue and South State Street to Logan Avenue are to be taken up within thirteen months. The tracks on North State Street from the interurban line to Harrison Street and along the latter street are to remain if so desired by the company. Within two years the company must decide whether it will obtain property consents and a franchise from the city to extend the operation of the interurban line over North State Street and Harrison Avenue with the view of a possible interurban extension to Rockford.

Transcona, Man.—The Council has granted a twenty-five-year exclusive franchise to H. W. Adcock, Winnipeg, renewable for five years and at the end of every five years thereafter, reserving to itself the right to take over the line on terms to be fixed by the Public Utilities Commission. The franchise requires that work be started immediately, the line to the Winnipeg city boundary to be completed first and the lines set out in the schedule to be completed within two years.

Malden, Mass.—The Bay State Street Railway and the Boston Elevated Railway have asked the Council for a franchise to relocate their tracks on Salem Street from City Hall Square to Bryant Street. As each company owns one rail, two petitions were necessary.

Columbus, Ohio.—The East Linden Electric Railway has asked the Council for a franchise to construct two lines in Columbus. One line begins at Champion Avenue and Long Street and extends on Champion Avenue to the corporation line of Columbus. The other begins at Water Street and Spring Street and extends on Randolph Street, Front Street, Naghten Street and Grant Avenue to Grove Street.

Walkerville, Ont.—It is reported that a franchise proposed to be granted to the Sandwich, Windsor & Amherstburg Railway or its subsidiary, the Windsor & Tecumseh Electric Railway, for the construction of a belt line in Walkerville will be voted on at an early date.

Medford, Ore.—The Southern Oregon Traction Company has received permission from the Council to abandon its Siskiyou Heights extension and use the rails and wires on a line to be built down the Hillcrest Road, tapping the Highcroft, Laurelhurst and Queen Anne Additions. A franchise was also granted for the construction of a line down West Main Street. Work upon both projects will begin at once.

TRACK AND ROADWAY

Fort Smith Light & Traction Company, Fort Smith, Ark.—To end the differences which resulted in the Fort Smith Light & Traction Company abandoning the use of the Fort Smith-Van Buren bridge more than a year ago, the Fort Smith-Van Buren Bridge Commission has made the company three propositions. One calls for an intercity fare of 5 cents a passenger with $\frac{1}{2}$ cent of each fare for the bridge district as bridge rental. Another proposes that the maximum fare be 10 cents, with one-half of each fare to go to the bridge district. The third proposition is for the company to pay \$250,000 in cash for the use of the bridge.

***Melbourne, Ark.**—Surveys will soon be made for a proposed electric railway from Guion to Melbourne. A. C. Veach, Gravette, is interested.

Pacific Electric Railway, Los Angeles, Cal.—The Pacific Electric Railway, as a result of a conference which was held in the city hall, has agreed to discontinue its use of the Southern Pacific Company's tracks on Broadway at Alamos Avenue. The company also agreed to install a new track before May 30, 1916.

Pacific Gas & Electric Company, Sacramento, Cal.—The Washington Improvement Club has appointed a committee to urge the Pacific Gas & Electric Company to construct a line between Washington and Sacramento. The proposed route extends over the M Street bridge through Washington to Riverbank.

Arkansas Valley Railway, Light & Power Company, Pueblo, Col.—Plans are being made by this company to construct a line from Pueblo to the State line through the Arkansas Valley in the near future.

Washington Railway & Electric Company, Washington, D. C.—Extension of the lines of the Washington Railway & Electric Company on New Hampshire Avenue to a point near the Eastern Star Home and thence by loop to the city through Takoma Park or Brookland, is urged by the Chillum Castle Heights Citizens' Association in a list of recommendations for public improvements filed with the Public Utilities Commission for consideration in connection with the preparation of the annual estimates.

Lewiston-Clarkson Transit Company, Lewiston, Idaho.—Plans are being made by this company to extend its line from Sixth and Sycamore Streets to Thirteenth Street and Hyland Avenue, Clarkston. \$10,000 has been raised to pay for this extension.

Aurora, Mendota & Western Traction Company, Aurora, Ill.—Officials of this company have asked the Public Utilities Commission of Illinois for permission to increase its capital stock from \$10,000 to \$100,000 and also have applied for a certificate of convenience and necessity. At a hearing held before the commission in Chicago opposition to the issuance of the certificate was made by officials of the Aurora, Elgin & Chicago Railway, who told the commission that it would cost \$1,000,000 to build to Mendota and that it would take all of the increased capital stock of \$100,000 of the new line to build between Montgomery and Aurora. The company offered to grant the Aurora, Mendota & Western Traction Company all of its transportation facilities between Montgomery and Aurora upon terms to be made by the commission. [Aug. 21, '15.]

Jacksonville Railway & Light Company, Jacksonville, Ill.—In connection with paving being done, this company will relay its tracks on South Main Street from Morton Avenue to Michigan Avenue.

Lincoln Railway & Heating Company, Lincoln, Ill.—This company has just purchased ties and other material to repair its tracks on Eighth, Union and Seventeenth Streets, Lincoln.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company has just completed the construction of new track on State Boulevard from the St. Joe River to Anthony Boulevard.

***Goshen, Fort Wayne & Northern Interurban Railroad, Goshen, Ind.**—Plans are being made by this company to build a line through Albion if the proper franchises, rights-of-way and depot sites can be secured. The proposed main line of the road will extend from Goshen via Benton, Ligonier, Albion and Churubusco to Fort Wayne, with a

branch from Warsaw via Winona Lake, North Webster, Wolf Lake, Albion and Kendallville to Ashley-Hudson, another branch from Ligonier via Topeka to Lagrange and a branch from Columbia City via Collis, Churubusco, Huntertown and Leo to Grabill. Clarence E. Tasher, Goshen, is interested.

Tipton-Frankfort Traction Company, Tipton, Ind.—The interurban project from Tipton through Kempton to Frankfort has been revived and the holdings of franchises and right-of-way of Eugene Purtelle, who projected the line, have been acquired by a Chicago company. This company now wishes to dispose of them to parties actively interested in the building of the road. [March 22, '13.]

Tri-City Railway, Davenport, Iowa.—Operation was begun on Oct. 1 on this company's new Fourth Street Line, Moline, Ill. The route extends from the business district of Moline to Fourth Avenue and Fourth Street.

Keokuk-Jefferson City Electric Railway, Keokuk, Iowa.—A meeting was recently held in Shelbina to discuss the construction of this company's line from Keokuk to Jefferson City. A committee was appointed to solicit funds to defray the expense of having the line surveyed through Shelbina. H. W. Knight, Chicago, is interested. [Sept. 18, '15.]

Iowa City-Muscatine Interurban Railway, Muscatine, Iowa.—This company has removed its offices to larger and more commodious quarters in the Hershey Bank Building. Although it has been rumored that the negotiations which look forward to the company taking over the operation of the Montezuma branch of the Rock Island line have been concluded, A. D. Bowen, who is promoting the project, declared that no agreement has been signed up as yet. [May 29, '15.]

Salina (Kan.) Street Railway.—The differences between the city and this company have been settled and the material hauled away is being replaced. The company made application for a permit to build the track which was granted by the Mayor. No mention is made in either the permit or application of the new city ordinance to which objection was made. At the same time practically all provisions of the ordinance are to be complied with. There are to be double tracks from Ninth Street west to Thirteenth Street and then north to the Union Station. The only tracks on Bishop Street will be a double track from Thirteenth Street east for 150 ft.

Salina-Northern Railroad, Salina, Kan.—Plans are being considered for the extension of this company's line northwest from Osborne. It is reported that plans are under consideration for the connection of the Salina-Northern Railroad with the Arkansas Valley Interurban Railway, which is being extended to Salina. E. A. Tennis, Salina, is interested. [Sept. 18, '15.]

Brandon (Man.) Municipal Railway.—It is reported that this company's extension on Percy Street has been placed in operation and work will soon be begun on the extension along College Avenue and Eighteenth Street.

Detroit, Pontiac & Owosso Railway, Owosso, Mich.—The Michigan Railroad Commission has authorized a bond issue of \$3,300,000 for the construction of this company's proposed line between Detroit and Owosso. It is asserted that the promoters have complied with all requirements of the commission. Plans are now being prepared by engineers for two routes into Pontiac, one of which will be chosen soon. Dr. Oliver H. Lau, Detroit, is interested. [July 24, '15.]

Hattiesburg (Miss.) Traction Company.—Citizens of Hattiesburg have filed a petition with the Mississippi Railroad Commission asking that the Hattiesburg Traction Company be forced to build an extension of its lines to the Women's College at Hattiesburg.

***McComb, Miss.**—It is reported that plans are being considered to construct an interurban railway from McComb to Summit, Fernwood and Magnolia, with a street railway in McComb. Guy M. Walker, New York, is interested.

United Railways, St. Louis, Mo.—When the grading of Taylor Avenue is completed this company will extend its Taylor Avenue line from its present terminus on Pope Avenue to Broadway, thus giving a connecting line between the extreme northern part of the city and Baden.

Moncton Tramways, Electricity & Gas Company, Moncton, N. B.—This company is laying 300 ft. of double track through the new subway on Main Street under the Intercolonial Railway. The special work for this double track has been ordered from the Canadian Steel Foundries, Ltd.

Morris County Traction Company, Morristown, N. J.—Hereafter, under an order of the Board of Public Utility Commissioners, this company will be required to operate its east-bound cars on the east-bound track and west-bound cars on the west-bound track on the Morris turnpike between Elizabeth and Springfield Junction. To facilitate this operation the board has ordered the company to construct a cross-over in Morris Avenue east of Main Street, in Springfield Township. There are two tracks, one on either side of the road in Morris turnpike, but the company has been operating most of its cars on the south-side tracks, thereby making it a single-track operation.

Monmouth County Electric Company, Red Bank, N. J.—The Board of Public Utility Commissioners has ordered this company to repair its tracks in Long Branch.

Buffalo, N. Y.—A contract has been awarded by the Tonawanda Board of Public Works to Louis P. Gipp, Buffalo, to remove the tracks of the defunct Tonawanda, North Main Street & Depew Railway in Young Street between Main and Delaware Streets at his bid of \$1,346. The track paralleling it is owned by the International Railway and will be taken up by that company.

Long Island Railroad, New York, N. Y.—The Long Island Railroad has applied to the Public Service Commission for the First District of New York for permission to construct and operate a two-track extension from Flushing to Creedmoor, in the Borough of Queens, 5.4 miles. At present Creedmoor is reached by a branch extending from the main line of the Long Island Railroad diverging therefrom at Floral Park. By providing the proposed new line a more direct route from Manhattan to Creedmoor will be obtained, and in addition a rapidly growing section of Queens between Flushing and Creedmoor will be provided with railroad facilities. The commission will hold a hearing upon the application.

Hiawasse Valley Railway, Andrews, N. C.—The directors of this company have authorized the sale of \$125,000 of bonds to complete the construction of its line from Andrews to Hayesville, 25 miles. S. E. Cover, Andrews, president. [April 24, '15.]

Alamance, Durham & Orange Railway & Electric Company, Burlington, N. C.—Chapel Hill and Bingham townships of Orange County have voted almost unanimously to issue bonds to aid in the construction of this company's line from Ossipee to Durham. Junius Harden, Burlington, president. [Aug. 21, '15.]

Piedmont & Northern Railway, Charlotte, N. C.—This company plans to construct an extension from its Gastonia line to Belmont.

Beaver, Meade & Englewood Railway, Beaver, Okla.—The Beaver Construction Company has received the contract for the completion of this company's proposed line from Forgan to Beaver. Grading has already been completed. The construction will include two small 14-ft. frame bridges on mud sills and one 350-ft. bridge on piling. L. A. Walten, engineer. [May 16, '14.]

Henryetta, Okla.—In addition to the proposed line from Henryetta to Dewar and Kusa it is planned to connect Henryetta with Rich Hill, Blackstone, Pleasant Valley and Coalton. James Liggett, Henryetta, may be able to give information; also the Board of Trade. [July 24, '15.]

Peterborough (Ont.) Radial Railway.—This company is reconstructing its track on Charlotte, Park and George Streets, rendered necessary by the city paving.

Trans-St. Mary's Traction Company, Sault Ste. Marie, Ont.—This company reports that it has rebuilt 4700 ft. of track. A concrete base with brick surface was used.

Northwestern Pennsylvania Railway, Meadville, Pa.—The State Water Supply Commission has approved the application of the Northwestern Pennsylvania Railway to construct a bridge across the Rhulings Branch, 1 mile south of McKean and to construct a bridge across Walnut Creek near Kearsarge.

Montreal (Que.) Tramways.—This company has laid 2 miles of new track and has reconstructed about 15 miles of single track on various streets in Montreal. It is contemplating the reconstruction of 3 miles of track. The company has placed an order in the United States for 1500 tons of 115-462 girder rail.

Dallas (Tex.) Southwestern Traction Company.—A survey has been begun of the right-of-way of this company's line from Glen Rose to Stephenville, which is the terminus of the line. E. P. Turner, Gaston Building, Dallas, president. [Aug. 21, '15.]

Three Rivers (Que.) Traction Company.—It is reported that this company has constructed 3.5 miles of track in Three Rivers and overhead work is now being put up. It is expected that this line will be placed in operation before the end of the year. Very little progress has been made in the construction of the suburban line, owing to the terms which the municipality asks for a franchise. [June 5, '15.]

Gray's Harbor Railway & Light Company, Aberdeen, Wash.—Street car service between Aberdeen and Cosmopolis has been resumed. The cars will not cross the West Bridge, but will stop on both sides. While officials of the company say that such service is operated at a loss, continual requests that it be established has led to the service being resumed.

SHOPS AND BUILDINGS

Humboldt Transit Company, Eureka, Cal.—The Humboldt Transit Company has filed with the California Railroad Commission an application for authority to issue and pledge eight first mortgage 5 per cent sinking fund thirty-year gold bonds to William Butterworth as collateral security for a loan of \$4,000 at 5 per cent for a year or less, the money to be used to purchase a site of a carhouse in Eureka.

Ottumwa Railway & Light Company, Ottumwa, Iowa.—Construction has been begun on the three-story Leighton & McNett Building, the greater part of which will contain the new offices of the Ottumwa Railway & Light Company. The building formerly occupied was destroyed by fire.

Southwestern Light, Power & Railway, Oklahoma City, Okla.—The Arbuckle Construction & Improvement Company has received a contract from this company to construct repair shops at Arbuckle and a power station at Davis.

Toronto (Ont.) Suburban Street Railway.—Work will soon be begun on the construction of a carhouse and substation for the use of the new Toronto-Guelph extension of this company. The estimated cost is \$10,000.

POWER HOUSES AND SUBSTATIONS

Ottumwa Railway & Light Company, Ottumwa, Iowa.—This company, under the supervision of the engineering department of H. M. Byllesby & Company, is increasing its power station capacity by the installation of a 200-kw., engine-driven generator. Improvements are also being made in the boiler room.

Public Service Electric Company, Newark, N. J.—This company has ordered from the Westinghouse Electric & Manufacturing Company one 1083-kva. 60-cycle, high-tension, 11,000-volt three-phase; low-tension, 2600-volt two-phase, air blast type duplex transformers; four 48-kva., single-phase, 60-cycle, 2400-volt, 10 per cent regulation induction regulators; and two 24-kva. 60-cycle, 2400-volt, single-phase, 10 per cent regulation O. I. S. C. induction regulators.

Interborough Rapid Transit Company, New York, N. Y.—This company has ordered from the General Electric Company six 4000-kw. rotary converters with three-phase transformers. This apparatus is for two new substations. Three of the converters will be installed in substation No. 45, White Plains Road, and three in substation No. 26, Jackson Avenue.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—The Interurban Construction Company has placed an order with the Westinghouse Electric & Manufacturing Company for the Salt Lake & Utah Railroad for three 250-kw., 750-volt, d.c. rotary converters for series operation on 1500-volt circuit, three-phase, 60-cycle, 1200-r.p.m. compound-wound a.c. self-starting, together with three 150-kva., 44,000-volt, single-phase, 60-cycle, O. I. S. C. transformers with triple secondaries, and complete switching equipment for same.

Manufactures and Supplies

ROLLING STOCK

Buffalo & Lake Erie Traction Company, Buffalo, N. Y., has issued specifications for ten new double-truck cars.

Washington Water Power Company, Spokane, Wash., has placed in service a new double-truck, one-man car, equipped with smoking compartment.

Wilmington & Philadelphia Traction Company, Wilmington, Del., noted in the *ELECTRIC RAILWAY JOURNAL* as expecting to purchase twenty-five new cars, has ordered this equipment from The J. G. Brill Company.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan., ordered from the Cincinnati Car Company last week three 50-ft., center-entrance, all-steel interurban cars, fitted with Westinghouse motors and equipment and air brakes.

Toronto (Ont.) Railway has been ordered by the Ontario Railway & Municipal Board to proceed with the construction of twenty-five cars with cross-seats on one side and longitudinal seats on the other, as noted elsewhere in this issue.

TRADE NOTES

Midvale Steel Company, Philadelphia, Pa., at a meeting of its board of directors on Oct. 4 elected A. C. Dinkey president to succeed William E. Corey, who acted as president temporarily for a week. Mr. Dinkey for several years has been president of the Carnegie Steel Company, a subsidiary of the United States Steel Corporation.

H. W. Johns-Manville Company, New York, N. Y., is exhibiting at the Electrical Show in New York City the latest designs of three lighting systems for which this company is sole agent: the I. P. Frink system of scientifically diffused reflective illumination; the Mitchell Vance artistic lighting fixtures and bronzes; and Gill Brothers "Parian Ware," the beautifully molded translucent ware used in semi-indirect lighting.

E. I. du Pont de Nemours & Company of Delaware, Wilmington, Del., has taken over the property and business of the E. I. du Pont de Nemours Powder Company of New Jersey. The new company assumes all liabilities of the old company, except capital stock and funded debt, and will carry out all contracts of the old company, there being no change in the personnel of the management, operations or methods of handling the business. It will issue capital stock to the amount of \$120,000,000.

Northern Equipment Company, Erie, Pa., has issued catalogs describing and illustrating the Copes boiler-feed regulators. One catalog quotes the 1913 report of the committee on power generation, which shows the desirability of this method of feed control because it "enables peak loads of short duration to be carried with a more uniform working of the furnace, as sudden demands for steam will cause a fall in the water level without a corresponding increase in the rate of feed." One of the catalogs among other things contains charts descriptive of successful regulator tests in the power plant of the Boston (Mass.) Elevated Railway.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has received the following awards at the Panama-Pacific International Exposition: Grand Prize for its exhibit of the Pennsylvania Railroad electric locomotive; Medal of Honor for a.c. and d.c. industrial motors and control apparatus, precision instruments, Le Blanc condensers, and on high voltage oil switches; Gold Medal for a number of different classes of apparatus, among which are steam turbines, a.c. and d.c. generators and railway motors, transformers, rectifiers, starting, lighting and ignition systems, switchboards and accessories, and mining locomotives; Gold Medal for the most complete and attractive installation in the Palace of Transportation.

McDonald-Gibson Automatic Train Control, Inc., New York, N. Y., has secured patents on an automatic train-stop and speed-control system, the operation of which will not permit a train to approach within two sections of another train, wreck or any obstruction that will form a circuit by touching both rails. An important feature claimed

for the system is that it is not affected by weather conditions because the only operating mechanism is a relay switch of the standard railroad type. The general principle of the system is that sections of the d.c. third-rail, or trolley-contact wire, are fed with alternating current which is sectionalized by impedance loads placed at the end of the conductor sections. If the track ahead is occupied or obstructed the a.c. circuit in the section to be protected is de-energized through the operation of a system of relays, thus de-energizing a coil which controls an air-brake valve on the train and applying the brakes. If speed control is desired each relay switch governing the a.c. circuit may be equipped with an ordinary time-element device. William Gibson is president of the company, D. M. McDonald is secretary and treasurer, and J. C. McDonald is vice-president. The offices of the company are located at 391 East 149th Street, Bronx, N. Y.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" railway headlights, delivered headlight equipment to the following railways during the month of September: Eastern Pennsylvania Railways; Argenta Inter-City Terminal Railway; Cincinnati Car Company for new cars of the Charleston Consolidated Railway & Light Company; Hot Springs (Ark.) Street Railway; Metropolitan Street Railway, Kansas City, Mo.; West Helena Consolidated Company, Helena, Ark.; Washington Water Power Company; Chicago & Joliet Electric Railway; Scranton (Pa.) Railway; Chicago, Lake Shore & South Bend Railway; Granite City Railway; East St. Louis & Suburban Railway; Ogdensburg (N. Y.) Street Railway; Tarentum, Brackenridge & Butler Street Railway; United Railroads of San Francisco; Seattle, Renton & Southern Railway; Windsor, Essex & Lake Shore Rapid Railway; Charleston-Isle of Palms Railway; Detroit United Railway; Roanoke Railway & Electric Company; Des Moines (Iowa) City Railway; Sioux City Service Company; Denver (Col.) Tramways; Mahoning & Shenango Railway & Light Company; East St. Louis, Columbia & Waterloo Railway; United Railways of St. Louis; New Bedford & Onset Street Railway; Bryan & College Interurban Railway; Lehigh Valley Transit Company; Iowa Railway & Light Company; Springfield (Mo.) Traction Company; Toledo, Bowling Green & Southern Traction Company; Virginia Railway & Power Company.

Midvale Steel & Ordinance Company, organized in Delaware with an authorized capital stock of \$100,000,000, divided into 2,000,000 shares of only one class of the par value of \$50 each, has contracted for the purchase of all of the capital stock of Worth Brothers Company, a Pennsylvania corporation, and for all the property and business of the Pennsylvania copartnership trading as the Coatesville Rolling Mill Company; also for somewhat more than 89 per cent of the capital stock of the Midvale Steel Company of Pennsylvania and for all the capital stock of the Remington Arms Company of Delaware. The directors of the Midvale Steel & Ordinance Company are: William E. Corey, Albert H. Wiggin, Samuel F. Pryor, Ambrose Monell, Frank A. Vanderlip, Alva C. Dinkey, Samuel M. Vauclain, William P. Barba, Percy A. Rockefeller, Charles H. Sabin, M. H. Dodge and F. W. Allen. Officers are: president, W. E. Corey; vice-president, A. C. Dinkey; secretary and treasurer, W. B. Dickson.

ADVERTISING LITERATURE

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued folder No. 180 on its second-hand railway equipment.

Hauck Manufacturing Company, Brooklyn, N. Y., has issued a folder which illustrates various effective applications of the Hauck burners in machine shops and for bending rails and making steel car repairs.

Ohio Brass Company, Mansfield, Ohio, has issued a sheet describing its Type J milling machine for bonding. It is stated that on one road recently an average was obtained by this machine of 149 joints per day for eighteen consecutive days.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued, as an appropriate guide or souvenir book for visitors to the International Exposition at San Francisco, an illustrated booklet containing large and stunning views of all the well-known natural wonders of the West, such as the Grand Canyon of Arizona, Yosemite

Valley, Canadian Rockies, Mounts Hood, Ranier and Shasta and other beautiful scenes. The booklet also contains photographs of buildings and other architectural details of the Exposition.

S. K. F. Ball Bearing Company, New York, N. Y., has issued a catalog describing and illustrating the uses of its self-aligning ball-bearing hangers for belt and chain drive shafting. The catalog reproduces a chart which demonstrates, from laboratory tests, the saving of power effected by these self-aligning ball bearings over ring oiled babbitted bearings. The booklet also discusses the advantages claimed for the self-aligning ball bearing hangers, in enabling the use of a smaller motor, as regards lubricant saving, cleanliness and reduced fire hazard, and as compared with roller bearings.

Trussed Concrete Steel Company, Youngstown, Ohio, has issued a catalog illustrating the uses of the Kahn building products for railroad structures. In the field of reinforced concrete these products include all types of reinforcement suitable for all structures, from the smaller culvert to the largest viaduct or building. They also include Hy-rib, metal lath and steel stud construction, United States steel sash, and Kahn pressed steel construction. As shown by a large number of illustrations in the catalog, these products are used by the New York & Boston Railway, Philadelphia (Pa.) Rapid Transit Company, Los Angeles (Cal.) Railway, Omaha & Council Bluffs Street Railway, Louisville Railway, Chicago Railways, Portland Railway, Light & Power Company, Portland, Ore., and Richmond & Chesapeake Bay Railway. Another catalog issued by this company describes the Kahn expanded metal mesh for reinforcing concrete when applied to floors and roofs, roads and pavements, sewers and conduits, tanks and walls, and culverts and bridges.

NEW PUBLICATIONS

Department of Commerce, Bureau of Standards, has issued technologic paper No. 48, entitled "An Air Analyzer for Determining the Fineness of Cement," prepared by J. C. Pearson, assistant physicist, and W. H. Sligh, aid in the Bureau of Standards. This paper discusses the various methods employed in the mechanical analysis of cement and describes the development of a new form of air analyzer for this purpose.

The Law of Electricity. By Arthur F. Curtis. Matthew Bender & Company, 26 John Street, New York, N. Y. 1119 pages. Buckram, \$7.50.

This is a complete modern work upon a subject of law that has shown enormous expansion during the last decade. Where formerly few decisions existed, now there are hundreds of reported cases that disclose well-defined rules of electrical law covering the powers, duties and liabilities of electric companies. Mr. Curtis' book is especially valuable because one-half of the decisions relating to electrical law have been reported since the publication of the last preceding textbook. The present work covers such topics as electrolysis, electrical injuries, electrical contracts, interference with currents, injuries to appliances, street railways, municipal ownership, master and servant doctrine, etc. Decisions of courts in the United States, England and Canada are cited.

Financial Developments in South American Countries. By William H. Lough. Bureau of Foreign and Domestic Commerce, Department of Commerce. 40 pages. 5 cents.

This reviews in about forty pages the situation as regards the currency, the money market, the principal banks and the general condition of business in Argentina, Bolivia, Brazil, Chile, Peru and Uruguay, during the last two or three years. Especial emphasis is placed on the results of the European war and the measures taken by the various governments, financial institutions and commercial communities to meet the situation thus created. There is also much up-to-date information with regard to the present state of affairs in South America as to credit extension, government finances, currency conversion, emergency measures and prospective changes and reforms.

The author is William H. Lough, vice-president of the Alexander Hamilton Institute, New York, N. Y., who has recently made a trip through the countries treated. The publication is to be had from the Superintendent of Documents, Government Printing Office, Washington, D. C.

Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, OCTOBER 16, 1915

No. 16

GROWTH OF THE NEAR-SIDE STOP

The graph showing the growth of the near-side stop in American electric railway practice that was submitted at the San Francisco convention constitutes a most impressive argument in favor of this method of operation. In a thoroughly conservative industry like that of electric railroading a consistent rate of expansion for any practice is bound to be an excellent measure of its utility. Thus the regular increase in the number of companies using the near-side stop, which was only four in 1907, but was sixty-five in 1915, shows a normal and thoroughly satisfactory popularity. The reasons advanced in the past for clinging to the far-side stop have, of course, been numerous and varied, but back of all of these has been the prejudice of a public which still shows the influence of an early training in the horse-car days. Clearly enough the near-side stop would have been a practical impossibility for the horse car, which was handicapped first by the impossibility of making a near-side stop with either platform at a cross-walk, and second by a slow and generally uncertain rate of acceleration, and in consequence the new practice has, until recently, been the subject of much opposition. That it has survived this is, we believe, fortunate for the industry, since an increase, during the past year, of 50 per cent in the number of companies using it is a very definite testimonial as to its merit, as well as an indication that the custom will soon become well-nigh universal.

BALLASTED AND SUB-BALLASTED TRACK

Supplementing the comments on the annual report of the Engineering Association way matters committee made in a general editorial last week we wish to direct attention to another important result of its work. Realizing the chaotic condition existing as regards the types of track foundations used to carry the same kind of traffic in different parts of the country, this committee recommended for adoption two types, of which most all others are nothing more nor less than modifications. Until more satisfactory results can be obtained from solid concrete construction, which contains many meritorious characteristics, the committee's action will doubtless meet with general approval. By every measure of the data collected throughout the country, the ballasted type of construction was the most popular and gave the best satisfaction. The committee believed, however, that this type of foundation would not meet all classes of traffic and soil conditions, hence recommended the concrete slab sub-ballasted construction. This is more expensive, but is certain to bridge over most unfavorable soil conditions and will

provide a uniform load distribution. The concrete slab, sub-ballasted construction also overcomes some of the undesirable qualities of the solid concrete foundation, namely, that it facilitates installation and makes possible tie and rail renewals without destroying the concrete substructure. Variations in the track surface after the concrete slab has set, may be corrected when the ballast is tamped beneath the ties. If the track becomes out of surface under traffic, the ballasted slab lends itself as readily to resurfacing as a plain ballasted foundation.

MORE TIME ON THE SAFETY CODE

Electric railway managers will approve the action of the United States bureau of standards in postponing for an indefinite period the conference which had been called for Oct. 27. In spite of the industry of the representatives of the bureau, and of the utilities which will be affected by the rules, in holding conferences in different parts of the country, it is still too soon to attempt to cast the rules into anything like final form. As the details are studied more and more closely it becomes increasingly evident that it is a stupendous task to frame rules which will conserve life and health and at the same time impose no unreasonable burdens upon the utilities. That the utilities are already alive to the importance of the safety movement is evident on every hand. A glance through the pages of the last few volumes of the ELECTRIC RAILWAY JOURNAL will serve to convince the most skeptical on this point as far as the electric railway industry is concerned. It should, therefore, be possible to codify the best practice in safety work in a way that will commend itself to all concerned. But such a consummation requires time, effort and co-operation. The bureau has been most reasonable in granting a request for more time so that additional effort in the direction of co-operation may be expended.

BROAD-MINDED COMMISSION POLICY

The decision of the Public Service Commission for the First District of New York in the Bronx Gas & Electric Company case, abstracted elsewhere in this issue, is not excessively liberal in its allowances of 20 per cent for contractor's profits, engineering supervision, contingencies and incidentals, and 12 per cent for preliminary and development expenses, for, as Commissioner Wood himself points out, these figures represent simply a conservative average of allowances made in analogous cases by this and other commissions. The allowances are essentially fair, however, and the commission deserves credit therefor. Yet it deserves more

credit for outlining at this time a broad and far-sighted policy in regard to such overhead charges. It is, of course, widely recognized now that overhead percentages, dependent upon the character and the continuity of construction work and methods, and upon the completeness of the appraisal and the construction records, should be included in physical value, but few commissions seem to be inclined to lift their gaze beyond the perusal of the facts presented in any particular case. Hence, it is encouraging to find the New York commission clearly enunciating such sagacious principles as the following: "If corporations do not receive fair and liberal treatment and are denied the right to include such items [as the above] in their expenditures to be reimbursed by the sale of securities, there will be no inducement or encouragement to attract capital, extension work will come to a stop and new enterprise will be discouraged," and "the investment of funds in public utility developments should be encouraged by those in authority as far as it is consistent and proper." Such prescience in valuation work is a thing to be cultivated by every commission.

RAIL-WEAR VALUE REPLACES GIRDER STRENGTH

Coincident with the more general adoption of permanent types of track foundations has been the tendency to substitute 7-in. rail sections for the 9-in. sections. This has been a logical evolution, since the 9-in. section has not proved to be a panacea for all track ills, although it aided greatly in prolonging the life of the track structure when more or less meager attention was directed toward improving foundations. Permanent types of foundations also, in a measure, account for the success attending the more general use of the plain girder rail sections, and improved pavement construction has done much to overcome municipal objections to this type of rail. From an economy standpoint the increased wearing area available in 7-in. plain girder and in the more recent grooved girder sections has tended to make them more popular than the earlier 9-in. rail sections. Full advantage has not been taken of the reduction in weight made possible by shallower sections to reduce the weight of the rail, but the metal removed from the web has been added to the head or other portions subject to wear and corrosion.

If an engineer designs the track structure in proper proportion, the additional cost of a more permanent type of track foundation may, to a certain extent, be offset by a reduction in the weight of the rail. This is especially true where the tendency was toward the heavier 9-in. grooved girder sections. Great girder strength is not as necessary with the properly designed permanent track foundations as it was with the older types, where attention was not directed to drainage problems and load distribution on the subsoil. Where the generally accepted permanent types of track foundations have been in service for periods of twelve to fifteen years, the substitution of the 7-in. for the 9-in. sections has been vindicated from an engineering standpoint. This applies particularly where the area of the rail head available for wear has been increased,

or, in other words, head wear area has been substituted for great girder strength. Manifestly there are some cities where this change cannot be effected owing to franchise limitations. On the other hand, there are plenty of examples of unusually long life and particularly satisfactory pavement conditions which could be cited as a most compelling argument for the 7-in. rail sections. Of course, there are localities where the traffic consists of unusually heavy interurban or steam road equipment, and a 9-in. rail may be necessary. On the whole, however, for average street railway and interurban traffic the substitution of the 7-in. for the 9-in. rail is a step in a direction which most companies would do well to follow.

PROBLEMS OF THE CLAIMS ASSOCIATION

Probably three of the most important points that came up before the Claims Association at the San Francisco convention were those concerning the prevention of motor-vehicle accidents, the standardization of claims statistics and the installation of a moving-picture exchange by the parent association.

Mr. Hare's careful and critical discussion of the first topic adequately summarizes all that has been said concerning motor-vehicle accident prevention, and his suggestion that uniform state laws be passed to cover motor-vehicle operation is commendable. Electric railways have done everything possible to cut down motor-vehicle accidents, but the persistent recklessness and disregard of the rights of others that characterize automobile collisions make it necessary for the drivers to be forced by restraining regulations to protect themselves and others. When, as the Long Island Railroad found out, it is necessary to install solid, heavy pole gates so that foolhardy drivers cannot disregard the warning of the closed roadway and break through, it is evident that the proper solution of the problem requires more than mere physical safety-devices and the like that have consistently been utilized by the transportation companies. We see no reason why the requirements for motor-vehicle drivers and the penalties for violations of operating regulations should not be as strict as in the case of electric railways and similar carriers, if not more so. Fully detailed and uniform state laws, inexorably enforced by state, county and municipal officers, would certainly aid transportation companies in their often unappreciated efforts to conserve public safety, and such a program merits indorsement by the association.

The standardization of claims statistics, together with the adoption of a standard claims-accounting classification, offers a fertile field for extended study by the Claims Association, and we confidently expect that by the next convention the association will be ready to take definite action along this line. The act just now of the joint committee on claims-accounting in deferring its report for a year is more praiseworthy than otherwise, for too much time can hardly be taken in endeavoring to unify, if possible, the multitude of diverse ideas held by claim agents on this topic. The difficulties of standardization may seem insurmountable, but they are

actually by no means so, as the accountants with their co-operative and compromising spirit have proved in their solution of the much broader problem of standardizing all their accounting theory and procedure. Mr. Slick's paper on standardizing claims statistics is valuable in outlining some of the questions that must be solved and in describing one system of statistical forms that has been found fairly satisfactory. As a contribution from experience it should receive due consideration by the joint committee in the final analysis.

The efficacy of moving pictures in safety work has in general been amply attested by those who have made use of this method of instructing employees and the public, but, as Mr. Warnock points out, many companies have not yet awakened to the possibilities of such a campaign or have not become sufficiently enthusiastic to put it into operation. The point here at issue is: "Should the American Electric Railway Association establish a film exchange?" Looking at this question from all points of view, we are inclined toward the belief that such an institution would have more favorable than unfavorable features. In preserving safety films of various manufacturers, in carrying only a specialized line, in saving money through mutual interchange of pictures, in making films readily available at a minimum cost to the small companies—in these and other ways the suggested film exchange would render accident prevention by moving pictures more convenient, economical and generally powerful. Some doubt the usefulness of such means as a deterrent or preventive of accidents, and not the least desirable result of a film exchange would be this—that no company would then have a really legitimate excuse for not proving to itself at first hand the possible results of this method.

LOOKING BACKWARD

In these days of the jitney and of the motor bus, it may be difficult to realize the enthusiasm which greeted the advent of the street car and its introduction as a substitute for bus transportation in cities. At present, certain advantages of the omnibus and jitney, such as their freedom of movement and fewer stops because of fewer passengers, appeal to many people, and claims are even made that the independent car is suitable as a transportation agent for at least a considerable part of the traffic in any city. In Denver, for instance, automobiles are carrying about one-fourth as many passengers in and out of the business district as the electric railway system. To understand what complete dependence upon the omnibus and private car would mean, however, and what a great boon the car on rails really was, one must go back to the time when the street car was introduced.

We had occasion in a recent issue of this paper to quote some passages from a book on "Street Railways," by Alexander Easton, published in 1857, when horse cars first began to supplant the omnibus, and said that we might again quote from that book in connection with views held of omnibus traffic at that time. We cannot give space here to all of the points brought out by the

author, but some of them are well worthy of attention.

In the first place, the author shows that both the time of the passenger and space on the street is economized by the car as compared with the bus. Space is economized, of course, because the car easily carries three times the number of passengers carried by a bus, but time is economized by the regularity of the service, as when buses were used exclusively it was found impossible to keep them on a regular schedule. If these conditions obtained sixty years ago with the low buildings of that time and the comparatively small amount of traffic on the streets, the advantages must be even greater now with the larger traffic and the streets lined with tall office buildings holding ten or more times the number of occupants. Again, Mr. Easton says "a street car can be taken and vacated without trouble or danger to the occupants of the car, whether invalid or infirm."

"There is marked reduction in the noise, the danger to other users of the street and to those wishing to cross at a corner are greatly lessened by the street car. The omnibus travels from one side of the street to the other, like 'an old rudderless monster,' picking up passengers or seeking a loophole to gain space, whereas the cars are confined to the middle of the street, where drivers of other vehicles and pedestrians can easily avoid them, because they know exactly the direction in which they are going."

The author sketches this picture. A rainy day. Every corner of the sidewalk crowded with impatient pedestrians, each anxiously peering up or down the street in search of the particular omnibus among the fifteen or twenty approaching to carry him home, which, with as many more coming in the opposite direction, so effectually choke up the street that the drays and carts, unable to cross at the intersections, render the highway impossible to private vehicles. The omnibus is crowded to excess, cannot accommodate those waiting to board, and the sudden halt, with imminent risk of collision, and the driver's "plenty of room, sir," with twenty passengers inside, by no means softens the temper either of those waiting or those who have taken passage, as they look upon each moment of unnecessary delay as an infringement on their right. This scene is compared with another where not an omnibus is seen in the entire length of the street. There is no noise, no blockade. Passengers are comfortably seated, and they converse and read newspapers in comfort. No rain drops in from the roof; ladies' dresses are not splashed with dirty water from the gutters. Private conveyances can use the streets with safety, and every one is pleased with the change.

The author may be somewhat biased, but those who remember the days when buses furnished the only means of transportation in an important section of a city, as on lower Broadway in New York during the seventies, will hardly consider the situation overdrawn. In any event, the great increase in congestion that has come with the advent of the skyscraper to the average business district in late years makes for conditions that demand something more than haphazard transportation.

Progress on C. M. & St. P. Electrification

The First Division Electrification of 113 Miles Is Nearing Completion and Construction Work on Three Other Engine Divisions Is Actively Under Way, Making a Total of 440 Miles of Main Line Equipped with Forty-Two 280-Ton Locomotives

REPORTS from Montana show that the work of equipping the first division of the Chicago, Milwaukee & St. Paul Railway's electrified zone is nearing completion, and it is estimated that by the middle of November the first electric train will be tried out between Three Forks, Mont., and Deer Lodge, Mont., a distance of 113 miles. At present construction crews are working from Harlowton, Mont., which is nearly 100 miles east of Three Forks, as far to the west as Drummond, Mont., the latter station being some 30 miles west of Deer Lodge, the western terminus of the electric division that is about to be placed in service.

The electrification, which includes 440 route miles and 650 miles of single track for the four divisions that extend across the Rocky Mountains is thus practically finished for a distance of more than 200 miles, the trackage that is being made ready for immediate train operation including extensive yards and sidings at Three Forks, Deer Lodge and Piedmont, as well as passing tracks at other points. The 100,000-volt transmission line that is being erected by the railway company to parallel the electrified tracks has been installed for an equal distance, and tie-in lines from the 100,000-volt system of the Montana Power Company are ready for service.

Overhead trolley construction and feeder lines are practically completed from Eustis, Mont., to Janney, Mont., making a total of more than 70 miles of overhead work, the former town being east of Three Forks and the latter near the city of Butte at the middle of the Three Forks-Deer Lodge division. The remain-

der of the overhead work westward from Janney is stated to be more than 50 per cent complete so that, in general, approximately 75 per cent of the overhead construction is in place. Three track-bonding crews are at work east of Three Forks, the bonding having been completed from Deer Lodge east to Canyon, a few miles east of Three Forks. The transmission line, which is of the wooden-pole suspension-insulator type with double cross-arms, has been completed from a point within 17 miles of Deer Lodge eastward to a point approximately 30 miles beyond Three Forks.

From the foregoing it is evident that the electrified division that extends between Three Forks and Deer Lodge is completely equipped, with the exception of the overhead construction between Butte and Deer Lodge. In addition, a considerable amount of work has been done east of Three Forks on the adjoining division, and in view of the magnitude of the undertaking, which is in charge of C. A. Goodnow, assistant to the president Chicago, Milwaukee & St. Paul Railway, the progress has been remarkable.

The accompanying illustrations show the general appearance of the new type of trolley construction that has been installed. It will be noted that wood-pole construction is used throughout both for cross span and bracket construction. The twin No. 0000 trolley wires are suspended individually and separately from the same steel catenary and the hangers of one trolley wire are located at points opposite the mid-span on the other trolley wire. In the switching yards, however, only one trolley wire is used, because the train movements at these points will take place at low speed, mak-

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—PROFILE OF ELECTRIC ZONE AND SUBSTATION LOCATIONS

ing the collection of the large drafts of current an easy matter.

SUBSTATIONS AND EQUIPMENT

Seven substations designed to supply power to the eastern half of the 440 miles of route have been completed and electrical equipment is being rapidly installed. Complete shipments of transformers, motor-generator sets, switchboards and other accessories have

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—
DOUBLE PULL-OFF ON CURVE FOR TWIN
TROLLEY WIRE

erection of the remaining seven substations located between Deer Lodge, Mont., and Avery, Idaho, at the western end of the electrified zone.

Each of the motor-generator sets in the substations consists of a 60-cycle, three-phase, 2300-volt, synchronous motor direct-connected to two 1500-volt direct current generators. The generators are connected permanently in series to supply 3000 volts to the trolley. Each set is also provided with an exciter at each end, one providing excitation for the revolving field of the motor and the other supplying the separately excited fields of the d.c. machines.

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—SUBSTATION AND OPERATORS' HOUSES AT TWO DOT,
NEAR THE EASTERN END OF THE ELECTRIFIED DIVISION

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—
HIGH-VOLTAGE, DIRECT-CURRENT SWITCHBOARD
FOR SUBSTATIONS

These sets are, in general, similar, except as regards voltage and capacity, to the five 1000-kw., 2400-volt units that have been in operation on the Butte, Anaconda & Pacific Railway for the past three years. However, there has been added one new feature which deserves mention. This consists of a longitudinal ventilation of the core and field coils similar to that employed in the well-known GE ventilated railway motor. The use of this method of cooling has effected a considerable reduction in the floor space required per kilowatt.

The d.c. generators are equipped with commutating poles and compensated pole-face windings to insure sparkless commutation under heavy overloads. The overload capacity is 150 per cent of the normal load for two hours, and 300 per cent of the normal load for periods of five minutes. This will provide ample margin for starting a train of maximum tonnage on the most difficult grades.

It is interesting to note in connection with these substations that the motor-generator sets are designed to

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—
430-HP., 1500-VOLT MOTOR USED ON
LOCOMOTIVE

operate inverted in case the power that is regenerated by the locomotives on the down grades exceeds that required by other trains operating nearby. For this reason there is no necessity for water boxes or other energy-consuming devices, since the excess energy is returned direct to the 100,000-volt transmission system.

SWITCHBOARDS AND TRANSFORMERS

The main direct-current switchboard in each station is of special interest, since it represents the latest practice in high-voltage direct-current switch apparatus. A panel is provided for each set and two panels are provided for feeders in each direction.

The circuit breakers and switches are mounted on separate panels located above and a short distance back of the main panels, similar in general to those now operating in the Butte, Anaconda & Pacific substations. The control handles for operating the breakers and switches are located on the main panels and are connected to the circuit breaker panels through insulated wooden rods.

In addition to the special high-voltage d.c. panels, switchboards are also being furnished for the synchronous motors and auxiliary circuits. Oil switches and

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—VENTILATED 2000-KW. MOTOR-GENERATOR SET FOR 3000-VOLT
DIRECT CURRENT

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—LOCOMOTIVE COUPLED TO THE "OLYMPIAN," THE FAMOUS TRANSCONTINENTAL TRAIN BETWEEN CHICAGO AND TACOMA

other standard 100,000-volt equipment are also being installed for the high-tension circuits.

The transformers are an excellent example of the most recent design and construction. There is a total of thirty-two of these units which are to be used for stepping down the power supply from the 100,000-volt transmission line to the 2300 volts required for the synchronous motor-generator sets. All are of the three-phase core type with a ratio of voltages of 102,000:2300. For regulating purposes taps are provided for 97,200 volts and 94,200 volts. Taps are also brought out on the secondary windings to give 1150 volts for starting the motor-generator sets.

The transformers are oil cooled and the tanks are of the tubular type, the main body consisting of steel plate with tubes welded to the sides of the tank at top and bottom, giving absolutely oil-tight joints. An air dryer and breather is attached to the tank so that all interchange of air between the interior of the tank and the outside must take place through this channel. This drier is provided with chambers containing a

moisture extracting medium thereby preventing the entrance of moisture to the tank.

The bushings furnished with these transformers are weatherproof and as all joints are tight, they are suitable for outdoor as well as indoor operation. At the top of the high tension oil-filled leads is a glass cup which shows the height of oil in the leads. Accessories consisting of thermometer, oil gage and drain valve are also provided. Each transformer is mounted on flat wheels to facilitate movement for making repairs and a lifting device is furnished for removing the transformer core.

In addition to the main transformer equipment, each substation is furnished with a standard 10-kw., three-phase transformer stepping down from 2300 volts to 110 volts for lighting and auxiliary power circuits. For operating the railway signal circuits, a standard, 25-kw., single-phase transformer is being installed in each substation, this stepping up the voltage from 2300 to 4400.

A portable oil drying outfit will be used for remov-

CHICAGO, MILWAUKEE & ST. PAUL ELECTRIFICATION—BONDING CREWS AT WORK—RADIATOR TYPE, 100,000-VOLT TRANSFORMER

ing moisture from the transformer oil. This outfit consists of a motor-driven pump which forces the oil through a specifically-designed filter and an electric drying oven for drying the filter paper. A portable oil-testing set will also be supplied.

For housing the families of the substation operators, four-room and five-room bungalows are being constructed at the stations and these will be furnished with light and power from the low-voltage auxiliary circuits.

LOCOMOTIVES

Work on the construction of the forty-two 282-ton locomotives for this electrification is progressing rapidly at the Erie Works of the General Electric Company and in the Schenectady plant of the American Locomotive Company. The first complete locomotive was placed on the test tracks early in September and shipment was made as scheduled on Sept. 25.

This locomotive has been taken in charge by the railway company at Chicago and it is now being towed over the lines of the Chicago, Milwaukee & St. Paul for purposes of exhibition at Chicago, Minneapolis, St. Paul, Spokane, Seattle and Tacoma, Wash. At each of these cities the time and place at which the locomotive is to be on exhibit is announced in the local newspapers. The engine is in the charge of two men familiar with its construction so that any questions which may be asked by the public will be correctly answered. Aside from the exhibition of the locomotive, moving pictures of it are to be exhibited at all points along the lines of the Chicago, Milwaukee & St. Paul Railway. An illustration on page 797 shows the locomotive coupled to the crack train of the St. Paul system, the "Olympian."

A complete set of tests on the Schenectady testing tracks indicate that the locomotive will easily exceed the expectations of the designers which were outlined in the ELECTRIC RAILWAY JOURNAL for June 5, 1915. The actual weights of the complete unit equipped for freight service are as follows:

Total weight	564,000 lb.
Weight on drivers	448,000 lb.
Weight per driving axle	56,000 lb.
Weight per guiding axle	29,000 lb.

Twelve of the locomotives on order are geared for passenger service and the remaining thirty are geared for freight service. Both freight and passenger types are equipped for regenerative braking, this apparatus being under control of the engineer. All of the passenger locomotives and several of the freight locomotives will be equipped with oil-fired steam boilers for heating the passenger trains, this equipment, of course, including ample storage tanks for oil and water.

Recent Conferences on the Safety Code

The American Electric Railway Association committee to confer with the bureau of standards on the proposed "National Electrical Safety Code of Rules," met in Rochester, N. Y., on Sept. 28, 29 and 30 in pursuance of its study of the code. At this meeting there were present representatives of similar committees appointed by the Central Electric Railway Association, the New York Electric Railway Association, and the Pennsylvania Street Railway Association. Those present were: C. L. Cadle, electrical engineer New York State Railways, Rochester, N. Y., and W. J. Harvie, Allen & Peck, Inc., Syracuse, N. Y., representing the American Electric Railway Association; Adolph Schlesinger, superintendent of distribution Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., and G. H. Kelsay, superintendent of power Union Traction

Company of Indiana, Anderson, Ind., representing the Central Electric Railway Association; James P. Barnes, general manager Buffalo, Lockport & Rochester Railway, Rochester, N. Y., representing the New York Electric Railway Association, and Gordon Campbell, president York (Pa.) Railways, representing the Pennsylvania Street Railway Association.

It was not possible to complete the work at this session and the meeting was adjourned to Oct. 5 at New York, at the rooms of the American Institute of Electrical Engineers, and the same procedure was followed in Rochester. In New York the American Association was represented by Messrs. Harvie and Cadle and by Prof. A. S. Richey, Worcester (Mass.) Polytechnic Institute. The other associations were represented as before excepting that Mr. Kelsay was absent. This meeting produced very beneficial results in co-ordinating details of electric railway practice.

On Oct. 6, by invitation of the bureau of standards, the committee and representatives of the bureau met and discussed in detail the suggestions which had been developed by the American Association's committee, with the co-operation of the state committees above referred to, and it was found possible to eliminate a considerable number of points of difference, thereby enabling the bureau and the committee to come much closer to agreement in perfecting the proposed code. It was not possible during the day to consider completely all of the suggestions made, and the committee expects to co-operate in further conference with the bureau and with the other associations.

Report on Taxation Matters

Owing to typographical errors the totals in the last two columns of Table III in the report of the committee on taxation matters of the American Electric Railway Association, abstracted in the ELECTRIC RAILWAY JOURNAL of Oct. 9, page 734, were erroneous. The percentage of total federal taxes to electric railway operating revenue for 1914 should have been 0.237 per cent instead of 6.717 per cent, and a similar percentage for the total of all taxes should have been 6.717 per cent instead of 5.702 per cent. The detailed total for Hawaii in the last column also should have been 5.176 per cent instead of 1.763 per cent. The following table compiled from the data in this committee's report shows the total comparative taxation figures as they should appear:

TABLE SHOWING RAILWAY OPERATING REVENUE, TAXES AND PERCENTAGES OF TAXES TO REVENUE FOR EIGHTY-THREE ELECTRIC RAILWAYS FOR YEARS ENDED IN 1904 AND 1914

	1904		1914	
	Amount	Per Cent of Railway Operating Revenue*	Amount	Per Cent of Railway Operating Revenue*
Railway operating revenue.....	\$140,183,165	100.00	\$237,968,085	100.00
Municipal taxes	4,378,048	3.125	8,108,476	3.410
State and county taxes.....	3,997,172	2.850	7,307,440	3.070
Federal tax			565,792	0.237
Total taxes	8,375,220	5.975	15,981,708	6.717

*United States percentage.

In a recent editorial the *Engineer* of London expressed the belief that field for the split-phase system of electrification such as has been installed on the Norfolk & Western Railway was limited in Great Britain, owing to the complications on the locomotives notwithstanding its great advantages in the use of the rugged induction motor with an overhead system having but one wire. The direct-current system was considered best suited to conditions on the British Isles.

Some Neglected Phases of Accounting*

Fundamental Valuation Principle Is Not Equity But Attraction of Capital, With Assumption of Risk by Investor Involved—Author Differentiates Between Capital Expenditures and Revenue Charges, and Analyzes Depreciation Accounting, Capitalization of Deficits and Franchise Payments

By HENRY RAND HATFIELD

Professor of Accounting, University of California, Berkeley, Cal.

THERE are five matters that call for careful consideration—namely, the fundamental principle of valuation; the differentiation between capital expenditures and charges against revenue; the treatment of depreciation; the capitalization of deficits, and the effect of payments for franchises.

Paramount among these questions is that relating to the valuation to be taken as the basis for rate regulation. In the torrent of discussion it seems strange that any aspect of the question should have been neglected. Nevertheless in most discussions there is a startling lack of any fundamental principle, of what Allison calls an "over-theory," by which the varying methods can be judged. One proposes a cost basis, another a reproduction basis, another a present-value basis, but comparatively little attention has been given to the principle by which these are to be tested.

EQUITY AS FUNDAMENTAL PRINCIPLE OF VALUATION IS NOT ADEQUATELY CONSIDERED

To be sure, it is generally implied that there must be some equity, but the question of what constitutes equity as between the public and the corporation is not adequately considered. Two writers of prominence, Allison and Whitten, have come to closer grips with the subject, but even these fall short of a satisfactory solution. Whitten's idea is that equity consists in an adequate reward for the sacrifice of the investor. Yet this statement is not followed to its logical conclusion and is made to rest on a forced analogy altogether begging the question at issue. In his argument supporting the cost basis, Whitten states: "[The corporation] devoted a certain amount of money to a public use and is equitably as much entitled to a fair return on that investment, provided the business can be made to earn it, as though it had actually loaned that amount to the public. * * * It is the actual investment or sacrifice on the part of the company that is entitled to consideration."

There are several points for criticism in this statement. In the first place, sacrifice is in itself not a basis for remuneration. In the second place, it altogether begs the question to compare the investment to a loan. Conceivably the transaction may resemble rather a lease with revaluations at stated intervals. In such a case no one questions its equity, even though the rental paid

in the later years is altogether out of proportion to the original value contributed by the landlord. Doubtless, if the investment in a public utility were like a loan the return should be like interest; but the bald assumption that it resembles a loan rather than a lease is purely gratuitous. Finally, in the statement that

a fair return is to be paid "provided the business can be made to earn it," the proviso is altogether out of place. No one asserts that San Francisco's obligation to pay interest on the municipal railway bonds is dependent on the road's making a profit.

Many other writers advocate original cost as the proper basis for rates, but all balk at standing consistently by it. The statement is emasculated by saying that the investment must have been a wise one—as if a loan were less valid because unwise. It must be recognized, says one, that competition may arise and destroy the value of the investment; hence it must be a proper investment as well as a wise one. Thus the statement that equity demands a return on the original cost because of the sacrifice involved has been so explained and modified as to lose any consistent character.

Furthermore, in discussing equity, consideration has generally been had to past investments rather than to present-day investments reaching onward into the future. The treatment of an early investment, made without any expectation that it would be subject to valuation, is a more difficult but much less interesting and much less important problem than the formulation of rules by which all future investors are to be guided.

OTHER CONSIDERATIONS ARE MORE FUNDAMENTAL THAN EQUITY

Attempts to formulate a principle resting on equity have led to hopeless confusion. It is time to recognize that, as far as the establishment of a settled policy for the future is concerned, equity is not the guiding principle at all. Any contract entered into freely and intelligently is equitable. In regard to public utilities there are other considerations more fundamental than equity.

This has, to some extent, been recognized, as when Bemis says: "The problem now is not so much an ethical problem of what a company ought to receive as it is what return, as a matter of fact, will tempt the investor to furnish the money needed for the growth of the business." Bemis here rejects equity and substitutes the incentive to investment of capital. Yet capital can be attracted either by increasing the prize or by guar-

*Abstract of paper read before San Francisco convention of American Electric Railway Accountants' Association on Oct. 6, 1915.

anteeing against risk, two methods quite distinct in their effect on the public. More fundamental by far is the problem of how the risks and the profits of new enterprises are to be borne, and particularly whether the public is to profit by new discoveries and improvements.

Allison has expressed a vain fantasy in saying: "The true aim of regulation is to bring about eventually a condition where, as far as possible, all risk and all speculation will be removed from the enterprise." Risks never can be eliminated from new enterprises—the question is, who shall bear them? In undertaking a public enterprise there are two distinct kinds of risks. The first is that of miscalculation as to the value of the service rendered, or the cost of its production. Error here may lead to an investment which cannot be profitable. Such a risk cannot be removed by rate regulation. If charging all that the traffic will bear still leaves a deficit, it is evident that no regulation of rates will prevent loss. Such risks may be borne by the investor. Yet to induce him to do so, he must be tempted by the prospect of rates high enough to cover the risk. They may be borne by the public, but only by public ownership or subsidies.

The second class of risks is more important to the discussion. It is, in the words of Chairman Stevens, "the competition of a new and superior service produced at a less cost which will secure all custom." In ordinary competitive industries such competition means inevitably a loss to the investor and a gain to the public. In public utilities direct competition is subordinate to regulation. Yet if a new discovery is made the public must adopt one of two courses—either it must maintain rates so as to yield adequate returns on the more costly plant, or it must adjust rates to correspond with the lower cost of the substitute process. The whole question turns on the advisability of allowing the investor to take this risk, or, on the other hand, of protecting him against this risk, as is implied in the original cost-loan theory. There seems no escape. Either the investor takes the risk, or the public foregoes the advantages to be derived from inventions, at least of inventions which would substitute a cheaper plant.

It is true that the public may itself be the investor, by public ownership or by granting subsidies, but the alternative remains. Either the investor, whether private or public, must bear the risk of competitive improvements, or the public must forego the advantages of radical improvements in the arts and sciences. A compromise may be made, but compromises, while allaying disputes, never settle principles.

It is perhaps not difficult to persuade the investor to undertake the risk. The risk of loss by supersession may be offset by the allowance of high returns during the period before the supersession takes place. Capitalists as a class will profit by some of the undertakings, but lose by others. It is, however, manifestly inconsistent to allow high returns as an offset for possible losses and then to demand that the high rates be reduced in the cases where the enterprise proves successful. It is difficult to determine the point at which a rate of return, only sufficient to induce the original investment, becomes exorbitant. There is need of considerable caution in applying the following statement laid down in the Commonwealth Edison Company report: "Capital is doubtless entitled to returns commensurate with the risks incident to the business. * * * But it should not be supposed that the early large returns should be continued when the development of the business, the elimination of competition, and the necessities of the community have largely reduced the risk of the investment." It much resembles refusing to pay a lottery prize, because the gain seems exorbitant as

compared with the price of a single ticket, although the purchaser may have squandered a fortune in the purchase of unsuccessful numbers.

WHAT THE REAL FUNDAMENTAL IS

The neglected phase of railway accounting first to be mentioned then is: In the discussion of a basis for valuation the problem of finding an underlying principle has been neglected. Even those who have attempted it have generally erred in regarding it as having to do with equity. Nor is it merely a problem of how to allure the investor into putting his money into an enterprise. He can be induced to take any risk if the stakes are made high enough. Fundamental to all, however, is the question as to whether the investor is to take risks, or whether the public is to go at a dead level, foregoing the economies coming from new inventions. It suffices to state the problem thus in general terms, although its many ramifications, such as the incentive to initiative in one or the other system, furnish room for much thought.

DIFFERENCE BETWEEN CAPITAL EXPENDITURES AND REVENUE CHARGES

The second point to be discussed is the real nature of the difference between capital expenditures and charges against revenue, when these terms are used in reference to the operations of public utilities. In some aspects capital charges and revenue charges are distinct, almost contradictory. These differences are strongly emphasized by the United States Supreme Court in the *Kansas City* case. Yet even in ordinary commercial undertakings the difference between the two is not diametrical. The machine, the tool, the raw material are all alike expenses of producing commodities. All are operating expenses, provided a long enough field of operation is taken into view. In public utilities the similarity is even greater than in ordinary business. Where rates are regulated so as to yield a fair return, there is little difference between a capital expenditure and a charge against revenue. The consumer must provide for both. For what is called an operating expense the consumer pays promptly. Where the expenditure is capitalized, he returns the payment more slowly but pays interest during the time of delay. There is but little difference whether principal is repaid or not, provided interest is paid indefinitely. In a few instances, as where the capital is invested in land, it resembles a perpetual annuity. Yet what is ordinarily called fixed capital is rather like a sinking-fund bond, in that the consumer pays interest on the investment, and through the charge for depreciation provides for the ultimate extinction of the principal. As far, then, as the relation between the corporation and the public as a whole is concerned, it is relatively immaterial whether an expenditure is called an expense or an investment of capital. In either case the public must provide for the reimbursement of the amount expended, together with a fair return on the investment while it remains unpaid.

In only one point is the difference significant. The public, while a permanent body, is made up of changing individuals. In so far as the body of consumers changes, injustice may be done to the consumers of one or another period, if an expense, which should properly be paid by the consumers of one period, is so treated that the consumers of another period are burdened by it. An expense, capitalized wrongfully, burdens later consumers to the advantage of present-day consumers. The position is reversed when what is properly a capital expenditure is treated as a current expense. The whole question then reduces to equity, not as between the

public and the corporation, but as between individuals composing the public at two different dates.

DEPRECIATION REPRESENTS INTERMEDIATE POSITION

Somewhat analogous is the third point of depreciation. In the discussion of this subject there has been even greater confusion of thought. Depreciation represents a position intermediate between a capital expenditure and a charge against revenue. An absolutely permanent investment of capital demands perpetual interest but no repayment of principal. A pure expense demands immediate return of the amount expended, payment to be made so promptly as to render calculation of interest unnecessary. Depreciation indicates that so-called fixed capital is, as a matter of fact, being repaid through rates, and presumably interest on the unconsumed capital should also be allowed.

TOO MUCH CONTROVERSY ABOUT EQUITY OF DEPRECIATION METHODS

In this matter there has been far too much polemical discussion as to the equity of one or another method of treating the problem. This discussion has become most acute in the conflict as to whether the straight-line or the curved-line method of calculating depreciation is correct. The advocates of either method almost invariably assume that the other method is unfair either to the public or the corporation. Here again there is, in reality, no question of equity as between the corporation and the public. Advocates of the straight-line method generally base the argument on some statement similar to the following, which is taken from the paper of a distinguished engineer: If one buys ten firecrackers and uses one, he has nine-tenths of his purchase still left to him. Similarly a plant costing \$100,000, with a life of ten years, is worth just \$90,000 at the end of one year. The curved-line method, calling for a smaller annual charge than the straight-line, is therefore only a partial payment of the property destroyed and consequently inequitable. The one thing which is certain, however, is that an investment of \$100,000 in a plant with a life of ten years does not represent the purchase of ten annual units each worth \$10,000. The sum of \$100,000 represents the present value of an annuity of \$12,950, interest being at 5 per cent. The decline in the value of such an annuity during the first year is not \$10,000 or \$12,950, but only \$7,949.

This principle can be perfectly illustrated with few figures by assuming a life of only two years and an interest rate of 10 per cent. A payment of \$100,000 for a utility lasting two years represents the present value of an annuity of \$57,619. This is made up of: Present value of first installment, \$52,381; present value of second installment, \$47,619; total, \$100,000. At the end of the first year there remains a value of \$52,381. The reduction in value then has not been \$50,000 or \$57,619, but only \$47,619.

It is apparent that it is incorrect to say that only the straight-line method is equitable. Yet the real error in most of the discussion is not that either side is wrong in claiming its method is correct, but that it fails to see that, where a public utility is concerned, there is no difference between the two methods. This may again be illustrated by taking a utility having an initial cost of \$100,000 and a life of two years, with interest reckoned at 10 per cent. An ordinary two-year investment at 10 per cent should bring in a total return, with interest compounded, of \$121,000. Yet exactly the same returns come in with a depreciating property, whether the depreciation is figured on a straight-line or on a curved-line basis. This is clearly shown by the following schedules:

STRAIGHT INVESTMENT	
Interest on \$100,000 for first year.....	\$10,000
Interest on above sum during second year.....	1,000
Interest on \$100,000 for second year.....	10,000
Principal returned	100,000
Total	\$121,000
INVESTMENT IN DEPRECIATING PROPERTY—STRAIGHT-LINE METHOD	
Interest on amount invested for first year.....	\$10,000
First installment of depreciation.....	50,000
Interest on above items during second year.....	6,000
Interest on depreciated value.....	5,000
Second installment of depreciation.....	50,000
Total	\$121,000
INVESTMENT IN DEPRECIATING PROPERTY—CURVED-LINE METHOD	
(Amount of sinking fund, \$47,619, + interest, \$10,000.)	
Amount paid at end of first year.....	\$57,619
Interest on above amount during second year.....	5,762
Amount paid at end of second year.....	57,619
Total	\$121,000

One may go further. In a public utility a "fair return" is considered necessary. A fair return is an impossible conception unless return of capital in some form is implied. The return of capital may be made at any time, in any sums, without in anyway affecting the equity between the company and the public. If the capital is excessively reduced at one time, the amount on which the public pays a return is correspondingly reduced. Yet just to the extent that interest paid by the public is reduced, the company is compensated by an early return of capital. Actuarially it is immaterial when and how a debt is returned, provided interest is allowed on the unreturned balance.

EXCESSIVE DEPRECIATION ALLOWANCE, HOWEVER, MAY PROVE INEQUITABLE

There is an element of equity, however, that is frequently lost to sight. An excessive allowance of depreciation, being a premature repayment of capital, does work a hardship in so far as there is a shifting of the persons purchasing the output of the corporation. One group can easily be benefited at the expense of another group. Thus in the instance given above the consumers of the first and second years would each pay \$57,619 under a curved-line system, while under a straight-line system the consumers of the first year would pay \$5,000 more than the consumers of the second year. As far as the corporation is concerned there is no difference, and as far as the consumers as a whole are concerned there is no difference between the two methods. Yet as far as there is a difference between the two groups of consumers, the curved-line method is equitable to both bodies, while the straight-line method burdens the earlier users to the advantage of their successors.

IMPORTANCE OF SPECIFIC DEPRECIATION RESERVE

The point just made carries with it some corollaries often neglected. Much discussion has been raised as to the importance of having a specific depreciation reserve set aside. Thus it is claimed by Hayes that the investors are entitled to a return on the full value of their investment only in case they can show that there is property in hand equivalent to the amount of the depreciation reserve. The real question is not whether the original value has been maintained, but whether the consumers have paid enough to cover ordinary operating expenses and depreciation. If \$100,000 is invested for public use and the consumers pay only enough to cover ordinary operating expenses (not including depreciation), evidently there is a decline in the value of the investment. Obviously, if investors are entitled to a fair return on the full cost of the plant they are none the less so entitled because rates have been made so low as not to cover the annual depreciation. The company is entitled to this return even though it does not comply with the requirement made by Hayes.

The question as to whether there is a depreciation reserve fund so placed as to be yielding interest also becomes meaningless, as far as the public and the company are concerned. The annual appropriation to reserve is less where it is calculated on the sinking-fund plan. But that is neither an advantage nor a disadvantage, for just to the extent that the sinking-fund interest lessens the amount annually set aside, to the same extent are the profits kept down by crediting to the sinking-fund reserve the receipts which otherwise would have gone to the general income account.

The problem of depreciation may be summed up by comparing the investment of the company to a loan which the debtor has the privilege of repaying in installments. If it is a loan of \$10,000, it might be repaid in ten annual installments of \$1,000. Yet neither creditor nor debtor would be harmed if more or less than a proportional amount were paid in each year. It might be repaid by any system, or with a lack of system. As long as interest is allowed on the outstanding balance, perfect equity is secured. The debtor might either pay in installments or merely keep up interest and himself accumulate a sinking fund with which to pay the principal. On the other hand, the creditor might, or might not, retain the installments as received and invest them in a sinking fund, so that he should have his principal intact at the end of the ten years. Any of these schemes would not affect the equities as between debtor and creditor.

DEFICITS SHOULD BE BORNE BY ALL BENEFICIARIES AS PERMANENT CAPITAL CHARGE

Another difficult problem is the fourth, relating to deficits. Where a deficit occurs in the early operations of a public utility, it is generally admitted that rates in subsequent years should make some adjustment. It is said that such deficits may be treated under either of two distinct theories—the first called “capitalization as an investment” and the second “recoupment as a loss.” The New York commission says there is a real and substantial distinction between considering a loss as an investment and as an expense to be reimbursed. Despite such high authority, it seems to some that a loss which must be reimbursed is an investment until it is repaid. If an ordinary business concern were in question, the distinction would indeed be valid. Yet in a public utility both investments and losses must be covered in order to secure a fair return. When the commission admits that the loss “must be reimbursed” all differences vanish.

Whether losses are actually repaid or are to be permanently capitalized is relatively unimportant, just as the nature of a government loan is not particularly changed when it is a perpetual annuity. Equity as between different consumers, however, may enter into the problem. If the loss is regarded as an essential to the establishment of the enterprise, it should be borne by all its beneficiaries, and the only way to spread the

expense is to make it a permanent capital charge. If paid off by consumers of the next five years, for instance, they are inequitably burdened with an expense which appertains to them no more than it does to the consumers of any other years. From an actuarial viewpoint the granting of a fair annual return on a given sum is neither more nor less advantageous than the actual repayment of the sum, just as it is neither more nor less advantageous to repay in five than in fifty years. This actuarial truth is not affected by other questions of public policy which may seem to make it more desirable to have debts promptly paid, but the equity of the case is not affected by policy.

The United States Supreme Court is doubtless sound in stating that “instrumentalities which are to be used for years should not be paid for by the revenues of a day or year.” (206 U. S. 463.) In so far as the deficit was merely a loss in furnishing service to consumers of one year, there is no shadow of equity in claiming that the consumers of any other year should pay the bills of the earlier consumers. The only justification of carrying the loss forward is that it is considered not as a loss of the first year, but as something pertaining to the entire operating life of the company. If this premise is correct, it follows that all subsequent consumers should pay their share of the burden, and that can most effectively be done by treating the deficit as a capital investment.

FRANCHISE FEE NEITHER BENEFITS NOR HARMS EITHER PARTY

Finally, for the fifth point, reference may be made to the effect of charging the corporation a fee for its franchise. Where such a fee is obtained, it is generally assumed by the city that a most successful bargain has been struck, and that the public has been benefited just to the extent that the corporation has been mulcted of the fee. Yet in the midst of the rejoicing over the shrewd bargain, some facts are apparently forgotten. In the subsequent regulation of prices a “fair return” is to be allowed on the entire investment. Hence the public must reimburse the company for the franchise fee paid, and must pay interest at a comparatively high rate while it remains unpaid. The situation is not different if instead of a direct repayment by the public, the fee is capitalized and counted as part of the investment taken over by a successor company. As long as the rule of a fair return is admitted, the entire cost of the franchise is borne by the consumers, whether it is amortized during the life of the franchise or treated as a permanent annuity. Hence the franchise fee neither benefits nor harms either party. All that it amounts to is that the city receives a considerable sum of income in advance, which is subsequently collected, not from taxpayers but from consumers. This indirect and unconscious collection of revenue may be advantageous or may not. Yet the transaction is certainly different from what it is popularly assumed to be.

Professor Hatfield's Fundamental Principle of Valuation

IN the discussion of a basis for valuation the problem of finding an underlying principle has been neglected. Even those who have attempted it have generally erred in regarding it as having to do with equity. Nor is it merely a problem of how to allure the investor into putting his money into an enterprise. He can be induced to take any risk if the stakes are made high enough. Fundamental to all, however, is the question as to whether the investor is to take risks, or whether the public is to go at a dead level, foregoing the economies coming from new inventions.”—HENRY RAND HATFIELD.

Foundation Principles of Valuation*

Appendix to Address Abstracted in Last Week's Issue—Fair Treatment to Public and Investors Demands Considerations of Value in Addition to Cost New—Amortization of Intangible Values and Typical Electric Railway Resettlements Are Described

BY BION J. ARNOLD

Chairman Board of Supervising Engineers, Chicago Traction, Chicago, Ill.

THE convention report number of the ELECTRIC RAILWAY JOURNAL, dated Oct. 9, 1915, contained an extended abstract of the address of Bion J. Arnold on "Foundation Principles of Valuation," based on electric railway resettlement cases. As an appendix to this address Mr. Arnold also submitted some notes on valuation and the amortization of intangible values, and a description of the three typical resettlement cases in Kansas City, Chicago and San Francisco. An abstract of this appendix follows:

NOTES ON VALUATION

In the Kansas City (Mo.) Railways proceedings the receivers requested "a disinterested valuation of the property and the necessary work to establish the property in first-class physical condition and enable it to fulfill its moral obligations to the community in every sense, under the conditions peculiar to Kansas City," and the finding of "a fair and reasonable sum to represent the capital value * * * for adoption in a contract for new franchises in the municipalities wherein the properties are operated, various elements of such value and how it should be apportioned between the municipalities."

It is of interest here to recite the considerations attached to this local problem as outlined by the receivers:

1. The use of the properties, present and prospective.
2. Original cost of construction.
3. Cost of duplicating to-day.
4. Present conditions.
5. Advantages and economy in operation as a whole.
6. Earning power at reasonable rates.
7. Territory reached, or allocation of property.
8. Past and prospective growth of tributary communities.
9. Transit facilities afforded between the cities.
10. Density of settlement and character of improvements.
11. Bonded debt in relation to physical property values.
12. Market value of bonds and other securities.
13. New money for present and future extensions.
14. Contractual relations between company and public for making possible the raising of new money.
15. The values fixed by assessing bodies.

Four methods were finally developed to verify the values recommended:

1. Actual cash investment and return thereon in the past.
2. Cost to reproduce new, less depreciation, plus intangible values, based upon reasonable future earnings.
3. Basis of deferred earnings upon actual investment.
4. Fair market value of properties: i.e., "that sum at which a fair buyer would buy and a fair owner would sell, both being willing to deal at a fair price."

In this case, with an assumption of a protected investment and superseded property left in capital, the

accrued deficit amounted to 6.5 per cent of the cost new (including overhead) based upon as low a rate of return as 6 per cent. At a 7 per cent return the accrued deficit similarly amounted to 36 per cent. When the superseded property was charged to operation year by year, the deficits were 40 per cent and 60 per cent respectively. The total valuation of tangibles and intangibles in the two cases, however, differed but slightly for a given interest rate.

It will be seen from the above citations that if valuations are to be predicated upon the assumption of fair treatment as between the public and the investor, there undoubtedly exist considerations of value in addition to cost new. It is also patent that these values can only be developed after searching inquiry and experienced judgment in the use of factors for future predictions. It will be quite clear, too, that the necessity of preserving complete and accurate records of past operations is paramount if utility operators expect to receive the treatment to which they are entitled in the final settlement.**

AMORTIZATION OF INTANGIBLE VALUES†

Views vary as to how far decapitalization should apply and continue, some contending that not only the intangible but also all the tangible property should eventually be amortized, so that the property would in time become possessed by the city without expenditure of money therefor on its part. Others contend that, in addition to amortizing the intangible values, there should be amortized only that portion of the value of the physical property which represents depreciation, and that such value as then remains in the property should be carried as a continuing investment by the company, in the case of a privately-owned company, or by the municipality, in the case of a municipally-owned property. This investment with present properties (owing to their comparatively recent construction and rapid development into new territory) is usually about 75 per cent of their cost to reproduce new value, although in properties restricted to certain districts and requiring no extensions, reconstruction or betterments but only maintenance and renewals, this would be about 60 per cent of their cost to reproduce new value. Therefore, if it is the policy of the city to retain the right ultimately to acquire the property of the company, the terms for so doing should be agreed upon and stipulated in the ordinance and the character and expense and method of amortization therein provided for.

**In the case of another Western road, which has been subjected to much manipulation and consequent attack, this accrued deficit, on an 8 per cent basis, amounted to 43.7 per cent of the total cost new. This company earned a profit from 1884 to 1887, when a considerable portion of the electric line was abandoned. This caused heavy deficits. Profits ensued after 1902 but only sufficient to reduce the former cumulative deficit by about one-eighth. In the case of a Western telephone plant, where the company had paid dividends of 8.3 per cent on actual cash invested and had maintained a considerable reserve fund for depreciation and other contingencies, the accrued deficit on a 7 per cent basis was comparatively small, amounting to a little more than 4 per cent of the cost new value. Here the reserve funds, while larger than usual, were still inadequate to care for the depreciation.

†Metropolitan Street Railway, Kansas City, Mo., report.

*Abstract of appendix to address delivered before the San Francisco convention of the American Electric Railway Association on Oct. 7, 1915.

With the continued growth of the territory and the resulting enlargement of the business of the company, the net return from operation will increase and should in time provide sufficient net profit not only to meet the requirements of the agreed fair return on the investment, but also to amortize that portion of the investment, to be agreed upon, which is not now represented by physical property. This procedure will be fair to the operating company, in that the company will be allowed to receive the fair return on all capital actually expended until such time as it is able to retire out of earnings the amount agreed upon in the ordinance as representing intangible values and superseded property.

The result of this procedure will be to decrease gradually the capital investment of the company in its property on a fair and sound basis, and will in the end tend to reduce the cost of the service. This reduction in the cost of the service can be applied either to the reduction of fare or to the increasing of the amount and quality of the service furnished by the company, or to any purpose of value to the public.

The decapitalization of intangible values cannot generally be accomplished economically by gradually retiring outstanding securities that have been issued for a fixed time. It can be accomplished, however, by increasing the physical property without correspondingly increasing the capitalization. The agreed portion of the net revenue from operation appropriated to the amortization fund should be used in the purchase of additional physical property, and the value of the physical property actually furnishing the service will then ultimately equal the capitalization. The rate at which such intangible value can be eliminated from the investment

RESETTLEMENT PLANS—FIG. 1—SHOWING DISTRIBUTION OF INCOME UNDER 1907 CHICAGO TRACTION PLAN, WITH NO SUBWAYS

RESETTLEMENT PLANS—FIG. 2—SHOWING INCREASE IN CAPITAL VALUE UNDER 1907 CHICAGO TRACTION PLAN, WITH NO SUBWAYS

is determined entirely by the rate of increase of the gross revenue and by the disposition of the net revenue agreed upon in the ordinance.

RESETTLEMENT PLANS

As stated in the preceding article, the central idea of the Chicago, Kansas City and San Francisco resettlement cases, although these were based upon somewhat different franchise conditions, was to put tangible property behind intangible values. The following paragraphs and accompanying diagrams show the essential details of these three plans.

Chicago: Fig. 1, Fig. 2 and Fig. 3 indicate graphically the results of the 1907 Chicago traction ordinances up to the present time, with predictions for the future. Two plans are worked out, one assuming the perpetual extensions of the surface system as the only transportation facility, and the other assuming downtown subways for the accommodation of the through-routed surface lines, such subways to be built out of the proceeds of the traction fund without the assistance of outside

RESETTLEMENT PLANS—FIG. 3—SHOWING INCREASE IN CAPITAL VALUE UNDER 1907 CHICAGO TRACTION PLAN, WITH CITY-OWNED SUBWAYS INCLUDED

RESETTLEMENT PLANS—FIG. 4—SHOWING DISTRIBUTION OF GROSS EARNINGS UNDER KANSAS CITY RESETTLEMENT PLAN (PROPOSED 1913)

capital. These subways, on this assumption, would be city-owned and rented to the traction companies.

Fig. 1 shows the probable distribution of income under this plan, based upon a 65 per cent operating ratio (including taxes and renewals). At the end of the franchise, the city's annual share will amount to more than \$5,000,000.

In Fig. 2 the capital value is shown to increase by extension, purchase and rehabilitation from the original agreed value of \$50,000,000 to approximately \$135,000,000 at the end of the rehabilitation period of the last property brought into the system (the Consolidated Traction Company). By the expiration of the ordinances it is estimated that extensions and betterments will have increased this capital value to about \$200,000,000, of which about \$11,000,000 represents the original intangible value of franchise rights and superseded property agreed to at the time of the resettlement. There is no direct amortization provided for in this plan under the ordinances. The city traction fund, however, representing 55 per cent of the divisible net receipts after bond interest on purchase price or agreed value, will gradually accumulate to a total of from \$75,000,000 to \$95,000,000, according to the rate of interest used. On the old basis of 2 per cent interest, the net purchase price to the city will then reduce progressively from a maximum of about \$140,000,000 after 1918-1919, and at the end of the franchise will actually be less than the present value of the property then existing.

In Fig. 3, which includes subways built out of the traction fund, the total capital investment rises to about \$275,000,000 by the end of the franchise. The purchase price to the city for the remaining surface line properties, however, will amount to \$195,000,000, which is less than the purchase price "agreed capital value," as

predicted in Fig. 2. By that time, about \$70,000,000 will have been invested in city-owned subways and uncapitalized, with approximately \$11,000,000 still remaining in the traction fund, over and above this subway investment.

In all of these studies the predictions for the future earning capacity have been scaled down to the minimum reasonable limit, far below what the property is now doing and what other larger cities of the size Chicago will probably be in 1927 are now doing. This shows the possibilities of the automatic amortization that can be legally carried out under the Chicago ordinances.

Kansas City: The Kansas City plan was similar to the Chicago traction plan except with the improvement embodying the amortization principle. One-third over and above the appraised present value, or \$7,500,000, was allowed in the original agreed value for intangibles. Yet these intangible values must be first amortized before either city or company can share in the divisible net revenues, which would take place about 1920. The operating ratio (taxes included) is fixed at 65 per cent, and 18 per cent of the gross earnings goes for maintenance and renewals. The city's equity is to be invested back into the operating property. Fig. 4 and Fig. 5 show the distribution of gross earnings and values.

In this plan, the purchase price to the city would from about the present time be gradually reduced to the level of the present value of the then operating property by 1924, or about the original "agreed value" assumed. And at the end of the franchise period the cost to the city would be less than half of the agreed value at that time and about equal to the original present value of the property appraised in 1912, or \$23,500,000 in round numbers.

San Francisco: The plans illustrated in Fig. 6 and Fig. 7 were developed in order to interpret the provisions of charter amendment No. 34, submitted to referendum in 1913. These are described in detail in the "Report on San Francisco Transportation Facilities," pages 82 to 91. At the time the report was prepared there existed a strong sentiment favoring acquisition of all street railway lines as a part of the municipal system. These plans, therefore, were formulated to show fair and practicable means whereby such results

RESETTLEMENT PLANS—FIG. 5—SHOWING DISTRIBUTION OF VALUES UNDER KANSAS CITY RESETTLEMENT PLAN (PROPOSED 1913)

could be ultimately brought about without jeopardizing either service or actually invested values.

The theory of the plans is still applicable to the situation, although the charter amendment was unfortunately lost at this referendum by a narrow margin. In the absence of a definite valuation, an estimated value was assumed for purposes of illustration, and a continuing underlying investment based upon real property. That is, it was intended only to amortize out of earnings original intangible values agreed upon in the resettlement and the shrinkage due to depreciation. This would be accomplished within the franchise extension period of twenty years. The net income used provided for upkeep of the physical property in a perpetual condition of 75 per cent new—i.e., 25 per cent depreciation after the end of the rehabilitation period.

Fig. 6 (resettlement plan No. 2) was based upon a definite apportionment of net income—35 per cent to city, 30 per cent to labor and to company, and 35 per cent in addition to 5 per cent prior return on agreed capital value (shown by full line). The assumed present value of property was \$21,000,000. The initial intangible value was \$14,000,000, all to be amortized at the end of twenty years. There was included \$7,000,000 of rehabilitation work, to be completed and capitalized within three years. The future investment was to increase at the rate of \$3 for each additional \$1 earned. The purchase price to the city at any date is shown by the dotted line, and intangible values to be amortized are indicated by the distance (shaded) between "purchase price" and "investment" (full black) curves, which values include depreciation accrued both prior to the resettlement and after the completion of rehabilitation. The city's share, if allowed to accumulate at 5 per cent, should suffice to equal the purchase price by 1947, and thus automatically recapture the entire property to the city without cost by acquiring the underlying securities covering these depreciated values; i.e., the actual value of physical property producing the

RESETTLEMENT PLANS—FIG. 6—SHOWING PLAN NO. 2 FOR SAN FRANCISCO CASE

RESETTLEMENT PLANS—FIG. 7—SHOWING PLAN NO. 5 FOR SAN FRANCISCO CASE

service. This plan "pools" the shares of the two parties, to give the city the option of increased service, decapitalization, extensions, etc.

In Fig. 7 (resettlement plan No. 5, which was recommended as the most practical one under the conditions) the Chicago traction plan was adopted together with amortization features. This plan differs from that shown in Fig. 6 in that profit sharing in the net income exists only between the city and the company, the former receiving 55 per cent and the latter 45 per cent. This increase in the city's share over that of plan No. 2 enables the city, if it allows its share to accumulate at 5 per cent interest, to take over the property without cost by 1941, six years earlier. In both cases, an annual reserve of 3 per cent of the gross receipts (at 5 per cent interest) will suffice to amortize all initial intangible values allowed (except depreciation). After the first twenty years initial intangible value is retired and this fund starts anew for amortizing part of the physical value. A further fund is necessary for amortizing accrued depreciation (except expenditures for rehabilitation), requiring 4 per cent of the gross receipts for twenty years and thereafter a sufficient amount to cover permanent shrinkage in value through depreciation. It will be noted in plan No. 5 that all initial intangible value is retired by 1933, at which time the cost to the city is equal to the then present value of the property. Amortization fund and purchase fund increase so rapidly during the later years that the actual amount of initial intangible value has relatively little effect on the date of acquisition. This fact is usually lost to view.

The estimated returns indicate that the extended property would be able to earn a rate of return on the probable tangible value approximating 10 per cent in 1930, or 8 per cent on the agreed capital value; that the company would receive more than 7 per cent on tangible values, and the city, exclusive of taxes, as high as 2 per cent in cash on tangible values.

Relation of Railways to Agriculture*

The Author Outlines the Practice of the Pacific Electric Railway in Its Development of Traffic Which Originates With the Farms Along the Company's Route and Advocates Co-operation Between the Railways and the General Public

By PAUL SHOUP

President Pacific Electric Railway

WHEN we speak of the relations of the electric railways to agriculture, I want to emphasize the fact that ideal agriculture, home-making agriculture, in large part leans upon, and is created by, the electric railways and the associated utilities. An analysis of all the relations would take too much time, but here are two facts that stand clearly forth, and you may make your own deductions: The county of all counties in the United States served in largest degree by an electric interurban railway system is Los Angeles County, Cal. The county of all counties that stood first, according to the United States census of 1910, in the annual value of products of the soil, and which still maintains that position, is Los Angeles County, Cal. Associate these facts and then, better than all the words at my command, you will interpret from them the mutual benefits and mutual independence of electric railways and agriculture.

We illustrate our own conclusions with our own experience, and because it illustrates the relationship between the electric railways and agriculture, I will give the possible experience of a farmer living along our electric railway lines.

He gets up in the morning and looks to the forwarding of his milk by a Pacific Electric fast freight. At breakfast he reads the morning paper brought by a Pacific Electric paper train. After breakfast his wife may telephone to a department store in the city and have the desired article at the house by express operating over the Pacific Electric not later than noon. At 8 o'clock in the morning the children leave for the Union High School on Pacific Electric cars, using school tickets sold at special rates. His place in order, the farmer may leave at 10 for the city, attend to his business at the bank, and if in a hurry get back home for lunch upon our cars. In the late afternoon he may send his berries and vegetables to market for sale the next morning. During the day he can get as many of the morning and afternoon editions of the evening papers as he may desire. In illness he is not isolated, but can get anything promptly, either nurses, drugs or doctors. In the evening, the family may take the electric car to the city and return comfortably after the "movies" are over. His friends may visit him from 40 miles away, spend the evening and get home before the lights go out. Wherever there is any population of consequence, there are electric railway stations not more than 2000

ft. apart, and these are artistic, lighted, resting places for passengers who may be waiting for trains. On holidays the farmer can go to any of the dozen beach resorts or to the crest of the wooded mountains at Mount Lowe, or to the Mission Play in the afternoon at San Gabriel, or to the hot springs at Arrowhead, or to

the famous inn at Riverside, or to any of the score of other pleasure places, and get back in time for dinner at home, no matter on what part of our line he lives. What is true in our county is no doubt true elsewhere, and in degree as conditions make possible.

The Pacific Electric Railway has encouraged intensive cultivation and the creation of small ranch homes whenever and wherever it can. It co-operates with communities in creating and distributing advertising matter. The most effective advertising for electric railways in getting people to settle along their lines is through co-operation with the communities already in existence. That is team work. Railway publications are apt to be discounted, though this is not so true as formerly. But where there is co-operation, where the railways back up what the communities state and the communities back up what the railways state, the most effective work is done.

Thus, if a pamphlet is issued by an agricultural community, indorsed by the Board of Supervisors and the Chamber of Commerce, giving individual experiences of satisfactory results from people already there, quoting government analyses as to soils, giving official statistics as to the annual products and the creation of wealth, picturing with photographs the homes achieved, making proper mention of the railway service as a factor in the life of the community, then the circulation of such pamphlets is valuable.

Advertising should request that replies be sent not to the railway company, but to representatives of the communities upon the ground, these in turn to follow up these inquiries and learn the specific desires of the inquirer. Finally they should meet him when he comes, and help him truthfully, directly and with no thought of reward except the good of the community in general. Thus is accomplished a great work. The ends of the electric railway are served for there is an addition to the patrons on its lines, and once resident there, the newcomer can thereafter hardly lift his spoon to his mouth without helping the electric railway.

This requires co-operative organization in high degree, but without it success is much diminished. For

*Abstract of paper read before the American Electric Railway Association Convention at San Francisco, Oct. 5, 1915.

railways to get out glowing advertising matter about any section and then leave it to the man interested to grope his way in an effort to reach home is not only waste and misdirected effort but is apt to lead to discouragement, disappointment and the bad advertising that follows in its train.

In advertising the sections along its lines the Pacific Electric spends thousands of dollars every year. It believes in co-operation and believes in publicity. The hope of the electric roads lies in the increase in population upon their lines. The work of creating traffic through excursions, conventions, picnics and the like leaves no such permanent results as that which brings population to the line.

The Pacific Electric operates sight-seeing trips every day in the year. These are the Mission trolley trip, the Balloon Route trolley trip, the Triangle trolley trip and the Orange Empire trolley trip. While established for direct profit, they serve a greater purpose in that they give opportunity to see southern California comprehensively to thousands of strangers who otherwise would see very little of it. They are, in my judgment, the best advertisement that southern California has had. No one can travel a few hundred miles upon the Pacific Electric and not be impressed from the very appearance of the homes themselves with the pride and satisfaction therein expressed.

Diverging perhaps slightly from the subject, I wish the people of this country had a real view of the mutual interdependence of the electric railways and agriculture. Putting it a little differently, we would like to get under the same wing of the government with agriculture. When I speak of government, I mean national, state and local. Nothing perhaps more strongly contrasts the views that the public has had than its widely different methods of treatment. The farmer raises something; we distribute it. One is as necessary as the other to give the article value, but the people have not fully found that out yet. The agricultural people have been looked upon as the sheep to be guarded, directed, encouraged; the transportation folks—well, perhaps we have been the goats.

Many of these modern governmental regulatory provisions are all right. Many are necessary from the public's viewpoint. Many of the burdens put upon us are unfair and will disappear in the course of evolution. The commissions learn this, but the public does not. The work of the commissions is thus hampered unless the public knows the facts. One cannot establish a department to deal with these problems because they can only be dealt with by the officers who are familiar in a practical way with the problems presented. This means that much time must be given to problems quite often in themselves not important. From the government the railways receive no such help as is given our agricultural associates.

Contrast these two conditions. Is there any wonder we would all like to be farmers? Farmers, I know, have their troubles. But so far as the relations of agriculture and the electric railways to the government are concerned, I am very sure that we would all be glad to have the association of agriculture and the electric railways so close that in government policy we might be considered as one.

I have no fault to find with the public when it knows it is just and when it is appreciative of our difficulties. But the things we do right are not apt to be uppermost in its mind. The good service we give is accepted unconsciously as a matter of routine. It is up to us to tell effectively and truthfully our trials to the public. We must win its confidence and its interest, and to do so must go further than fair dealing. We must tell

the people of our weakness, as well as of our strength. The public must learn that the electric railways are business institutions traveling upon the most narrow of business margins. Without the government's active support and sympathy they may in large measure disappear.

This is no alarmist statement. The time has passed to gloss over the facts. The electric railways of California have created hundreds of millions in property values, not only in the agricultural communities served but in cities and towns that they have helped to build. No community leans upon jitney service; none desires to lose a single car or train because of that service. They realize unconsciously that all the automobiles in California together transport but a small fraction of the number of people that are carried by the electric lines.

Before me are the earnings of nearly all the electric lines in California for the last three fiscal years. The showing is a bad one. Only one out of twenty-four made as good a showing during the fiscal year ending June 30, 1915, as for either of the two preceding years. Obligations to the public have increased; taxes are higher; paving costs, because of high standards, are greater; labor costs, where there have been changes, have increased; automobile traffic has required additional safety measures. On the other hand, automobile competition has cut revenues. Returns for the year are the worst in the history of the roads in this State, as a whole. No interurban line and but few city lines earned interest on their investments or on their interest-bearing obligations. One only of the twenty-four declared a dividend. Several are in the hands of their creditors. From such a showing, even after making allowance for general depression of business, which is widespread, it is plain that the public view must in some measure change if the electric railroads are to be maintained in their present efficiency.

Taxation must be lessened, not increased. Street paving burdens in many instances must be reduced or the lines abandoned. While adjustments in rates are individual questions, yet fares as a whole must be increased rather than lowered. Jitneys, dividing the traffic of the electric roads, must divide likewise their heavy obligations. Where the electric lines are providing and maintaining a large part of the street and where the community is under moral obligation to protect the investment made because of this and the investment needed to meet franchise requirements as to service and fares, the jitneys must, where practicable, be kept off such streets, and where, in the business centers, they use the streets, they must be required to bear some part of the paving burden. On very few streets or on very few interurban lines is there enough business to support two classes of carriers. Our returns show that. Of course, the jitneys assail our best earning lines, and the natural result of this is, no longer having fat lines to carry the lean ones, the service on the latter must be reduced or the lines given up. Only a small alienation is necessary to reduce income to the level of operating expenses. The public must know these facts, and knowing them must choose between. It is at this point we have arrived.

I have wandered from my subject, but perhaps not far. If the electric railways are impoverished, so will be the communities along their lines, and as the Pacific Electric felt the blow to the citrus fruit industry through the freeze of three years ago, so likewise will these communities feel any blow to the Pacific Electric.

On our side, we should not give too much weight to our troubles as troubles. We are face to face with serious problems, the solutions of which lie in a better

understanding with the public. We should meet the situation with constructive courage. We must seize upon methods to decrease our expenses and at the same time, if possible, to increase the efficiency of our service. That is the door through which we get business. If there be a new industry in sight, go after it. If a new stopping place is needed for passenger traffic, establish it. Furnish freight platforms. Furnish team tracks in plenty. If interline freight and passenger tariffs with steam line connections can be obtained, get them. Let us look after our express and package business and help the express in competition with the parcel post.

Public complaints and demands should never be looked upon as aggressions of an enemy but, instead, as sources of our education as to the public's interpretation of its needs. Its expressions should be listened to with intelligent interest. If its wishes warrant changes being made, meet them. If not, explain pleasantly and patiently why they cannot be made. We must take the people into our confidence. If service has to be reduced or rates raised, put forth the reasons plainly, concisely. Let us do all we can to get more people along our lines.

Population is our greatest asset. The good-will of the public is likewise a great asset. Work in a co-operative and cheerful spirit with every public agency whose duty it is to concern itself with your affairs. Remember these commissions themselves are between two fires. They are responsible, not to our stockholders and bondholders, but to the public, and very, very often they are the agencies that must be called upon to stand between us and the lack of popular understanding of our needs and difficulties. It is thus up to us to help them where we can with their work and never to hinder them, to show them why a thing is so, and if they suggest real improvements upon our methods, to adopt them.

By scrupulous integrity in dealing with these public agencies by fair, truthful and candid statements to the public in all matters pertaining to and concerning the public, we will find the surest road to that goal which we would reach, where the people of the United States will hold the same viewpoint as to the value of agriculture as expressed in the creation of farms and of farm products and the value of transportation in maintaining these farms through the transportation service rendered.

The Importance of Accrued Accounts*

From Point of View of Certified Public Accountant, Operating Accounts Do Not Always State the Entire Facts—Accounting for Commission and Organization Expenses, Depreciation, Taxes, Premiums and Discounts, and Sinking Funds Should Follow Uniform Practice

BY JOHN F. FORBES, C.P.A.

Haskins & Sells, San Francisco, Cal.

UNDER the inspiration of the American Electric Railway Accountants' Association and the various commissions, state and federal, the accounts of transportation companies are maintained with a greater decree of accuracy and a more highly organized standardization than are the accounts of any other class of business concerns. Yet the certified public accountant rarely has occasion to review the accounts of any electric railway without feeling that there is a need for standardization of practice that is quite as important as the standardization of forms and accounts.

The first and most general criticism is that the operating expenses do not invariably state the entire facts. The elemental purpose of detailed accounts is comparison. An operating cost is high or low only by comparison. The operating expenses of a normal period should present a basis for comparison with some other similar period. Yet when a company begins to apply over a series of months of this year credits for old copper wire, old carwheels, or any other scrap or re-

placed material, which has been garnered last year and sold or taken into stock this year, it has distorted the accounts of both years and the basis of comparison is gone. When it further complicates this by charging one month with enough car paint to last six months, or enough repair parts to last four months, or ties sufficient

to last three months, and so on, just because the departmental requisitions upon the storekeeper happen to come in that way, it is not alone destroying comparative value but is also laying the foundation for serious errors in the balance sheets regularly prepared from the books. Many responsible railway officials point with pride to a supply of stores or a heap of scrap as provision against that rainy day when a credit will reduce some extraordinary operating expense. When the accounts must include certain charges or credits, why not accrue them irrespective of their nature into the periods in which they belong, and thus establish facts?

This condition obtains in various forms in most of the operating expenses. Only last month one company was found accruing its insurance from the date of payment of the insurance bills instead of the date of the insurance itself, upon the theory that another payment

*Abstract of paper presented at San Francisco convention of American Electric Railway Accountants' Association, Oct. 6, 1915.

would not have to be made for twelve months. The current operating expenses were not affected, for the practice had been in vogue for a long time and the amount of insurance premiums, though large, was fairly uniform, but the balance sheet as disclosed by the company certainly did not present the exact financial condition.

There is absolutely no uniformity in charging off railroad commission expenses, organization expenses, or any of the host of similar unusual expenses over a long period of time. Indeed, there is a reluctance to charge them off at all. Yet in the commission states where the companies have no option in these matters, would it not be better for comparison's sake, if no other, to establish more uniformity in the handling of such items than now exists?

Nowadays, instead of considering the subject of depreciation as a thing apart—something to be considered more for its effect upon the United States Treasury Department than upon the stockholders, electric railways under the urgings of late Interstate Commerce Commission classifications are endeavoring to look upon depreciation as a mere operating expense, but thus far with poor success. Rarely is depreciation handled twice in the same way. Utility commissions touch lightly upon the subject, being fearful of establishing precedents. It is really not such a serious thing in those utilities where the burden is borne by the consumers, but where depreciation must be borne by stockholders, as it must be in those instances where car fare is fixed by franchise, the question of whether depreciation from obsolescence should not be capitalized looms large. This is especially true where changes follow each other so quickly that the capital cannot be returned out of earnings.

Sometimes reserves are accrued according to formulæ prepared by famous engineering firms after elaborate appraisal. If upon the sinking-fund method, then generally the proper investments are not being made and remade on the dates indicated, if at all. Sometimes the accounting officer reminds his associates that the reserves are not being reinvested semi-annually according to the plan, but generally he is satisfied in setting up the reserve. Sometimes depreciation reserves are accrued upon the straight-line basis, represented by specific funds, though more often they are represented by general assets. Sometimes depreciation is accrued upon the curve-line basis and sometimes on a percentage of gross earnings. Almost invariably the reserves are diminished by charges to it. One hesitates at the thought of passing upon the propriety of these charges. It is such a simple thing innocently to defeat the most conservative financial plan by using up these reserves with what would be operating charges if the reserve did not exist. The present situation, therefore, calls for a standardization of ideas upon depreciation—otherwise another element in the detailed operating figures is absolutely useless and the balance sheet departs from the truth.

Perhaps the one account which above all others gives the public accountant most concern is the tax account. As an accounting proposition, it is clear enough. The accrual approximates the monthly tax cost. If taxes are paid in advance of the accruals there is an asset. If they are not paid in advance of the accruals there is a liability. The trouble lies in the fact that there are so many confusing elements to be reconciled. For instance, in California a corporation tax is paid on gross earnings. A tax on the 1914 gross is paid in 1915. It would seem proper to begin to accrue this tax in January, 1914. But when the tax was first instituted the regular property tax was in vogue and property was

assessed and taxed in the year fixed as a basis for the first gross-earnings tax. So the gross-earnings tax had to be paid in the following year. Therefore companies might seem properly to begin accruing the tax to be paid on the 1914 gross in January, 1915, though it is not payable until the middle of the year. And so some corporations handle it. Some, however, contend that the tax is applicable to the State's fiscal year 1915-1916, and insist upon commencing to accrue in July, 1915, while some, bulwarked behind the opinions of eminent counsel, maintain that since taxes become a lien on the first Monday in March, March 1, 1915, is the day upon which to commence accruing the tax. Then comes a corporation which began to operate in April, 1914, and one is almost back at the starting point. Yet the outlook is different, since not to charge up taxes for an entire half year is unthinkable. And in any event the State officials say they most assuredly tax that company in 1914, although they collect the tax in 1915. Then, just to make it hard, the municipal franchise and vehicle licenses join hands, so to speak, with the city, county and State tax on non-operative properties, the State corporation franchise tax and the federal income tax. And out of all this the public expects public accountants to establish an asset or liability, while the company accounting officers grieve if the former do not agree with their figures and say differences reflect discredit upon them.

Much might be said of "accruals, not due" on notes and accounts. Accruals on payables are always handled conservatively. Where the interest is fixed, as in notes, the calculations usually square with experience. Where the interest is neither fixed nor certain, as in accounts payable, accruals are usually based upon the hope of their never having to be paid. Quite the reverse is true of the receivables. Here a spirit of optimism is in constant evidence. "Accruals, not due" are so easily subject to adjustment that they worry no one save the accountant who is trying to establish their cash values as assets or liabilities. Interest on bonds is the one accruing account almost invariably properly handled. It departs from the narrow way occasionally when the bonds happen to have been bought up by the trustees or by the company for investment. Generally, however, this charge is fixed and unvarying and no complications ensue. On the contrary, discount and premium accounts are apportioned off with a marked hesitancy by nearly all utilities. Every old railroader feels that discount is part of the cost of property and that it should be capitalized.

The one account which, above all others, possesses an individuality is the reserve for sinking funds. Regularly it emerges from its closet to disturb the public accountant. A tremendous confusion of ideas, created in great part by the legal phraseology of trust deeds, exists with reference to sinking funds, and many methods of handling them are in force. By far the greatest amount of trouble occurs in not letting these sinking funds completely alone so far as the accounts are concerned.

The impression seems to have gone abroad that, because a company dedicates certain resources to the payment of a debt, surplus is in some way affected. This is absurd. Of course, if a company desires to make specific appropriations of its surplus, there is nothing to do but set up a reserve. Such companies may exist, but the writer has never seen one. Yet company after company ties up its surplus most unnecessarily. It is a most conservative thing to do, however, and public accountants can afford to look upon the practice with complacency. All they ask for is a little uniformity in the practice.

Papers Before the Claims Association

Address of President Tichenor—Among Topics Considered Were Prevention of Motor-Vehicle Accidents, Standardization of Claims Statistics, Card Index, and Safety and Its Relation to Conservation, with Written Discussion Accompanying the Last Subject

Program for Monday

Annual Address of the President.
Annual Report of Executive Committee.
Annual Report of Secretary-Treasurer.
Reports of Committees:
Accident Prevention Board—W. F. Weh, chairman.
Employment—B. B. Davis, chairman.
Ways and Means—J. S. Harrison, chairman.
Paper—"The Prevention of Motor-Vehicle Accidents," S. B. Hare.

Program for Tuesday

Paper—"Standardization of Claims Statistics," E. E. Slick.
Report of Committee:
Claims-Accounting—co-chairmen: H. K. Bennett and H. J. Davies.

Program for Wednesday

Report of Committee:
Claims-Transportation—co-chairmen: B. B. Davis and R. P. Stevens.

WM. TICHENOR
President

Wednesday—Continued

Changes in Constitution and By-Laws.
Paper—"A Card Index and What It Means," J. J. Reynolds.

Program for Thursday

Paper—"Safety and Its Relation to Conservation," B. F. Boynton.
Written Discussion:
"Financial Benefits Resulting from the Safety First Movement," J. S. Harrison.
"Justification of the Safety First Movement from a Humanitarian Standpoint," Alves Dixon.
"Uses and Benefits of Illustrated Lectures," H. K. Bennett.
"Should a Moving Picture Film Exchange be Established by the A. E. R. A.?" F. J. Warnock.
General Business.
Reports of Convention Committees:
(a) Resolutions.
(b) Nominations.
Election and Installation of Officers.

THE ELECTRIC RAILWAY JOURNAL of Oct. 9, page 767, presented an abstract of the proceedings of the Claims Association at the San Francisco convention on Oct. 4-8. In accordance with the usual custom, abstracts of the papers read at the various meetings of this association are published this week, as follows:

PRESIDENT'S ADDRESS

BY WILLIAM TICHENOR, CLAIM AGENT TERRE HAUTE, INDIANAPOLIS & EASTERN TRACTION COMPANY, INDIANAPOLIS, IND.

From the beginning of this year's work it has been the endeavor of the officers of the association and the executive committee to dispose of unfinished topics rather than to originate new subjects for discussion. Particularly was it desired to place special stress upon three things: The Hooper-Holmes Index Bureau, the safety-first movement, and the standardization and classification of accidents.

The Hooper-Holmes Index Bureau from the beginning has not met with as much approval from claim agents and general officers as many thought it justified. This bureau is not of itself essential to the existence or well-being of electric railway claim departments, for they might build up a similar organization among themselves that would be extremely valuable. Because of its necessarily local existence, however, such a bureau would be of much less value because claim agents would know nothing of what was going on in the index bureau world outside of their own association community. Wonderful benefits are being derived from the Pacific Coast Claim Agents' Index Bureau, and great good is coming from some of the organizations local to the East, but if all companies should join and report freely to one bureau, as in the case of the Hooper-Holmes Index Bureau, each would get the benefit of all engaged in claim work, not only with electric railways but also with steam railroads, manufacturing establishments and insurance companies.

It seems strange that some of the most important electric railway men are utterly opposed to the use of

an index bureau, either national or local, because in their view it requires a great deal of time and expense to the companies and is of no value to them. Yet since the first contract was made with the Hooper-Holmes people, this thought seemed to be so prevalent that at the convention last year the committee on an index bureau recommended that the contract cease. The committee did not consider that the bureau would not be valuable if properly used, but it felt that the contract was practically valueless because nearly all companies then reporting to the bureau were individual subscribers to it and gained no additional right through the contract. On final vote, however, it was unanimously recommended that the contract be extended for at least one more year.

At a meeting of the executive committee of the parent body immediately after the adjournment of the 1914 convention, the question again came up for discussion, and the same point was raised. Finally, however, a renewed contract ending Dec. 31, 1914, was approved, and the secretary was instructed to communicate with the member companies to ascertain their desires as to the continued life of the contract. A sufficient number expressed a wish to continue the arrangement and promised to report in the future, to justify continuing the contract for 1915. It may fairly be said, however, that 1915 is to be treated only as a test, the results of which will control future action on this point.

The safety-first movement since its origin has been as much in doubt as the Hooper-Holmes Index Bureau, if indeed it has not been more of a vexed question than that. Some of the most enthusiastic safety-first advocates put the greatest stress upon the education of children and their mothers. Others insist that a better result is to be obtained through the enactment and rigid enforcement of stringent laws to control the public, especially automobile drivers. Still another class believes that the public cannot in general be educated to a realization of its dangers, and that the better method is to educate company officers and employees until they come fully to an appreciation of the fact that they must expect the public to be careless and to be depend-

ing upon them for safety. Not long ago an experienced claim agent said that 75 per cent of the serious and costly accidents on interurban railways were preventable, and that 50 per cent ought not to happen and would not happen if the car-service men thought straight and right. This claim agent is under the impression that the greatest benefit possible to be derived from the safety-first movement must come from a hounding process causing the motormen and conductors to think safety instead of speed. In short, there are as many different plans as there are different minds dealing with the subject, but it is to be hoped that at this meeting harmonious action may be suggested.

At the 1914 convention the Claims Association had a joint committee with the Accountants' Association on the subject of the standardization of accidents and accident reports, as well as accident accounts. When this joint committee met, it seemed to have concluded that the first division of the subject was completely a claim agents' affair and that the latter division was completely the work of the accountants. The accountants had no trouble in agreeing upon the recommended standards of their side of the committee and the report was unanimously adopted. When the report was presented by the claims side of the committee, however, complete chaos prevailed on account of the many ideas suggested in discussion. The whole subject was therefore referred to the committee for another year's study. This committee held several meetings during the year and I trust that eventually the whole subject will be understood and agreed upon.

PREVENTION OF MOTOR-VEHICLE ACCIDENTS

BY SAMUEL B. HARE, CLAIM AGENT ALTOONA & LOGAN VALLEY ELECTRIC RAILWAY, ALTOONA, PA.

No other class of accidents contains the elements of carelessness, recklessness and utter disregard of the rights of others that are found in automobile and motor-vehicle collisions. Transportation companies, realizing their responsibilities, have done everything possible to protect the public from harm, yet there is a tendency on the part of the public to demand protection without making an effort to protect itself. To relieve this condition, we must seek measures to protect ourselves from the expenditure of large sums of money in damages, by throwing around others a safeguard which they are unwilling to provide for themselves, or which they carelessly and negligently refuse to exercise. The time has come when we must prohibit the automobile and motor-vehicle driver from using his own judgment (or misjudgment, as is frequently the case), and surround him with restraining regulations for the protection of himself and others.

It may reasonably be presumed that railway companies have done that which is necessary to prevent accidents. Their constant change from old to new appliances and equipment, the introduction of every practical safety device, the most careful supervision of track conditions, the rigid preliminary examination and patient, early training of car operators, the rigorous discipline that punishes any infraction, the constant warnings by signs, and numerous methods of advertisement—all these, accomplished at an enormous expense, are indubitable evidences of the good faith of the railway companies toward the question of conserving the safety of the public.

As compared to this preparation, care and attention, what qualifications as to mechanical knowledge, physical ability or fitness are requisite for the applicant as a driver of a motor vehicle? None! He need only fill out a printed blank form, stating the make and character of

his machine, its horsepower, his name and residence, and inclose the fee, proportionate to the horsepower of his machine, whereupon the state grants the license with authority to operate, making no inquiry whether the applicant is mentally, physically, morally or mechanically prepared to assume the implied responsibilities. The conclusion is certain that the great number of motor-vehicle accidents must be attributed to stupid, inadequate and worthless license laws now operative, and the foremost step toward the prevention of this class of accidents should be made in the revision of these laws.

Compulsory legislation by the enactment of uniform state, county and municipal laws is the only solution to the prevention of motor-vehicle accidents. Of what use to an automobile driver is a sign if he cannot see? What effect has a horn or gong upon a deaf driver? What escape for a careful person as against an epileptic? What refuge has a person from the wild wanderings of a drunken, careless or negligent driver? Of what use is an emergency brake to a one-armed or one-legged man? What does the joy-rider care for the safety of the man he meets? Should a high-powered motor vehicle be permitted in the control of a young boy or girl under the age of twenty-one years, or an old man or an old woman over the age of sixty years? Should a dwarf 36 in. in height be permitted to operate an automobile? Should a person adjudged of unsound mind be given authority by the state to operate a machine? Should a driver who had already recklessly killed three persons in his machine be allowed to retain his license? Should an unnaturalized person be granted a license? Should any license be issued without the assurance of physical fitness and mechanical qualification? Not one of these persons could ever hope to obtain employment as a street car operator on any railway line, yet each and every one can obtain the privilege of operating a motor vehicle, of much greater horsepower than a street car, on every highway within the commonwealth.

The first move toward the prevention of motor-vehicle accidents would be the enactment of uniform state laws, a section of which should be devoted to the regulation of the speed of all motor vehicles, fixing a speed limit for rural as well as congested city districts, establishing rights-of-way and providing for the turning at the approach of or in passing another car. The dominant measure of such a statute should be a standard or test of the physical fitness, mechanical knowledge and the moral character of the individual, with the positive requirement of a practical demonstration. The owner of every car should be required to file an approved bond, either for himself or driver, conditioned upon the proper indemnity to persons killed or injured. Penalties for violation of the law should be severe and should include the arrest or impounding of the motor vehicle and its sale for fines, costs and damages. The state department should immediately be informed of the transfer of ownership of each motor vehicle. Lighting regulations should be the subject of legislative enactment.

Rigid ordinances for the operation of motor vehicles, in conformity with state laws, should be enacted by municipalities, and traffic squads and police officers should relentlessly enforce such requirements. Such ordinances should designate the line of travel, the manner of passing standing or moving street cars or other vehicles, the method of crossing at intersecting streets and the establishment of safety zones, and in short should incorporate all the provisions of the state laws. After the enactment of such uniform state and municipal laws, it would be the duty of automobile associations, motor clubs, safety committees, committees of 100 and all interested individuals to exercise a general supervision in relation to the strict and inexorable enforce-

ment of the laws by the officers of the state, county and municipality.

In the past, much has been written and said concerning motor-vehicle accident prevention, and it is now fitting and proper that this association take some concerted action to meet this imminent peril. The subject should be presented to the accident prevention board, appointed two years ago, or possibly a new and separate committee could be specially appointed with directions to draw up immediately a bill for presentation to the legislatures of each state. In view of the ultimate beneficial results of such procedure, there is scarcely a doubt that it will receive the indorsement and financial support of the parent association.

USES AND BENEFITS OF ILLUSTRATED LECTURES

H. K. BENNETT, CLAIM AGENT FITCHBURG & LEOMINSTER STREET RAILWAY, FITCHBURG, MASS.

This kind of publicity, illustrated lectures, is one of the most tactful ways to present the question of public safety in use at the present time. One may theorize and speculate to his heart's content and still be far from the mark, but a truthful representation of what has happened impressed upon the brain of the individual starts a train of thought that will never be entirely dissipated and cannot fail to produce results. It is not enough, however, to show pictures of electric car accidents and the perils of the street. Neither is it enough to confine education by means of pictures to the public alone, for as "charity begins at home," so should education begin with the employee. He should be thoroughly schooled as to the common accidents that occur in the performance of his duties, and be shown how easy it is to prevent just such an occurrence with his advance intelligence of what the public may be expected to do under certain circumstances. When he is shown what thoughtlessness may do in a personal way, he will think of himself and the net gain will be for the welfare of the public and the company that he represents.

Hence the scope of this kind of a campaign should not be limited, and as a matter of fact there is no limit. It can be adapted to the use of the kindergarten or the board of trade, and for every intermediate point that can be imagined. There is not a single society or organization that could not be entertained and instructed. In an eastern city where 300 women, representatives of the best homes, were gathered at one of these lectures and were shown how they invariably got on and off cars, along with other interesting views and the consequent results under certain circumstances, they agreed that they had never given the matter personal thought but that what they had seen was all true. Since that time there has been a marked decrease in this class of accidents, and it therefore cannot be said that there are no results from this kind of work.

At a recent meeting of the "Safety First Association" of an eastern city, the president of the local team drivers' union pledged the support of himself and his society to do everything possible to minimize traffic accidents, and when a representative of a street railway showed views of various vehicle accidents in connection with electric cars, this delegate admitted they were true. Think of it, a labor organization, primarily organized for the sole benefit of its members, standing shoulder to shoulder with a railway corporation for the betterment of humanity through the prevention of needless accidents. Does educative publicity pay? Can one picture a more ideal condition of affairs?

The public schools, from the creeping tots to the senior classes of the high and normal schools, clubs of

all kinds, lodges of every description, labor unions of every class are a target for a campaign of this character. Even the churches have been invaded with gratifying results, for those who have experience with accidents and their results can never have a creed for the righteous or unrighteous, the rich, poor, blind or crippled. There is no limit to the use, and the benefits are as many as the human mind is capable of absorbing. Seeing is believing, and the nearer the public can be brought to actually seeing what they are doing every day to fill the hospitals and the streets with cripples, the more they will appreciate their responsibility in avoiding accidents.

A criticism has been made that nine-tenths of the accidents happen to a class of people to whom one might talk by the hour and show pictures all day with as much effect as if they had not been approached. This cannot be so. There is not a single individual who has an ounce of perception and a teaspoonful of brains, that cannot be brought to a realization of conditions through the eye. People will not grasp everything, but they will grasp enough to get an idea, and what more can be asked than to have them absorb enough to keep them out of danger along certain lines. It cannot be expected that one picture and one lecture will be enough to produce miracles, for it is only by repetition and bringing the matter to these minds time and time again that real results are secured. The results are not going to come to-day, to-morrow or next week, but when the public has been reached in all of its classes. To speed the good work there should be no delay in starting this educative campaign, this gospel of "Safety First and First Aid to the Uninjured."

STANDARDIZATION OF CLAIMS STATISTICS

BY E. E. SLICK, CLAIM ADJUSTER UNION TRACTION COMPANY OF INDIANA, ANDERSON, IND.

The difficulties in the way of standardizing claim accounting and statistics appear almost insurmountable, since there are almost as many different ways of transacting claim business as there are different companies. For example, in one class of companies all the accounts of the claim department are kept by that department and its results are audited, while in another class the accounts are kept entirely by the auditing department, to which all claims are referred for payment after an adjustment or agreement has been reached. Under these divisions, it would appear to make little difference in the details of the payment, whether the claim account is kept by the claim department or by the auditing department, but the author recommends the general method of the account being kept at least nominally by the auditing department, in harmony with the standardized accounting rules, regardless of the details or methods by which money is placed in the hands of the claim department for settling claims after an agreement has been reached.

A standardized plan will not show all the valuable data at a glance, because the classification will present condensed facts. These condensed facts will probably answer very few of the questions that may be required by the management, and the classification must be such that any question may be readily answered from the collected data at some stage of the boiling-down process. It is conceivable that the management may ask for data concerning platform accidents at a certain road crossing, or collisions with vehicles at a highway crossing, the number of employees injured at certain shops, the number of accidents of any week or month as compared with any corresponding week or month of another year, the accident record of all or part of the men

employed, the number of collisions with automobiles, the number of third persons killed and injured, and numberless similar questions, all of which may or may not be asked in comparison with other weeks, months or years. Hence there must be a uniform system setting out these data, so that the statistical sheets will answer such questions as well as give the final results used for comparative purposes.

Even after selecting a standardized classification, the choice of a physical basis for keeping statistics presents a vital problem, for the physical property of the associated companies consists of interurban systems, city systems, park lines, elevated lines, subways and perhaps many others. The writer's personal view is that the physical unit should be a terminal, or a division of the property generally under the control of a local superintendent, from which point trains are originated and runs are estimated. Sub-terminals should be classed with the terminals. The terminal may be made up of both city and interurban service. In the smallest properties, either of city or interurban service, there would be at least one terminal, while the larger properties must be made up of a number of terminals, since all trains cannot originate at one place, if the physical property is stretched over a large territory.

Whatever classification of accidents is used, the same classification must be carried forward uniformly from the actual events to the financial results or the cost of this same class of accidents, in order to make the statistics valuable for comparison. If platform accidents are a class, the cost of platform accidents must also be given, and likewise with every item of the various classes. In order to do this it is necessary to make the very earliest collection of accident data in harmony with a definite plan. It is inconceivable that the management of any property does not want accident data, and accordingly it is suggested that a report be made at stated intervals, presumably weekly, by collecting the accidents and classifying first as to terminals and second, under the terminals, into accidents on city cars and accidents on interurban cars. Make other divisions as desired, but hold to the above-named divisions.

Probably the cost of cleaning up a wreck will not enter into the claim statistics at any stage of the game, but the matter of car repair on account of particular accidents, such as collisions and derailments, is an important question, and especially so if damage should be done to foreign cars. It would appear the more reasonable that the cost of repairs to foreign cars should be charged to some item in the claim department, and no doubt it would be fair so to charge this expense.

When special data for claim statistics were demanded of the writer by the management, he found a virgin field from which to extract the data, since no statistics had been kept by his predecessor, except a weekly report to the general manager, classified under as many heads as there were different lines. Since the method put in practice has produced reasonable results, it may be well to outline these results. The first act was to collect the accidents for one week under the head of the proper terminal, which was responsible for the men involved in the accident; and, second, to group this division into city and interurban accidents. It is generally assumed up to this point that accidents to employees are as carefully kept as accidents to other persons, but a simpler form under the following heads is used: Roadway, Electrical and Shops, and Trainmen. These divisions are recommended, whether or not the company has a larger or smaller number of departments having control of this line of work, since it is believed that practically all the work on the physical property is done under these classes.

If a number of heads are used for a terminal, the same heads will be applicable to either interurban or city accidents, and no matter how many terminals there may be, the same items are simply repeated under each terminal. Therefore, in presenting such an outline, it is necessary to give it for only one interurban terminal, the same item being repeated for the city terminal, if it be desired to keep them separate.

The first real statistical blank is a monthly blank with items as indicated below:

Day of Month.....	1	2	3	30	31	Total
Platform accidents.....	1	1	1	1	1	5
Collisions with vehicles....
Collisions between cars....
Collisions with persons, things and animals frightened.....
Derailments.....

Under general heads, the following items are used: employees slightly injured, employees severely injured and employees killed; passengers slightly injured, passengers severely injured and passengers killed; trespassers injured and trespassers killed; all other persons injured and all other persons killed; baggage claims; ejectments, and stock killed. City and interurban accidents were classified under these heads for a given terminal, and the terminal repeated as often as necessary.

On this monthly sheet there are thirty-one spaces for the days, and the item is indicated with the date of the happening. The items added horizontally indicate the number of accidents in that class for the month, and added vertically indicate the number of accidents for each day, the latter having no special statistical value. The figures obtained from the horizontal additions, of course, indicate the accidents under that head for the month, and are the figures carried to the next condensed sheet, as follows:

ACCIDENT REPORT				MONTHLY FOR THE YEAR 19...			
Month of Year.....	Jan.	Dec.	1910	1920			
	**	*****	**				
Platform accidents.....	5	6	19	20			
Collisions with vehicles....			
Collisions between cars....			
Collisions with persons, things and animals frightened.....			
Derailments.....			

The above outline contains the same items reduced from all the terminals, and for both city and interurban, into one class under its appropriate head, i. e., all the platform accidents are collected in one number for this sheet, and twelve spaces are used for the months, followed by any number of spaces for the years, so that this last sheet will show at a glance the items for the different years.

Then a financial sheet is prepared as follows:

FINANCIAL SUMMARY OF ACCIDENTS				MONTHLY FOR THE YEAR 19...			
Month of Year.....	Jan.	Dec.	1910	1920			
	**	*****	**				
Platform accidents...Cost	\$75	\$50	\$200	\$150			
Collisions with vehicles....			
Collisions between cars....			
Collisions with persons, things and animals frightened.....			
Derailments.....			

This contains the same items as the monthly accident report, followed by twelve spaces for the months and totals for any number of years. Thus the last financial report will show at a glance the cost for each year

under its appropriate head, as indicated above. This blank should be filled by taking account No. 92 from the auditor's books and collecting the data under the proper head.

The foregoing suggestions are not intended in any way to influence the work of the Claims Association committee on this subject, but only to indicate a method that has been put into practice and found fairly satisfactory.

A CARD INDEX AND WHAT IT MEANS

BY J. J. REYNOLDS, CLAIMS ATTORNEY BOSTON (MASS.)
ELEVATED RAILWAY

A card index is nothing more or less than an intelligence department. As the intelligence department is part of the claim organization, it must act in conjunction with other departments, and its highest efficiency can only be reached when all other departments are kept up to the same high standard. Stated briefly, the work of the intelligence department can be brought under the three heads: filing, indexing and summarizing. By filing fixed places are provided for the materials; by indexing there is extracted what is useful, and by summarizing the various extracts are brought into one consistent statement. By indexing the bulk of the original materials is reduced, and by summarizing the bulk of the indexed information is reduced. The most important part of the entire work of the intelligence department is indexing, for through it information is made accessible and ready for use, and is selected for special requirements.

No pains should be spared, therefore, to construct indices on the most systematic plan. A systematic card index of whatever kind or for whatever purpose is not to be regarded as a pretty plaything, or a little odd job to be hurried through in a few minutes, which may be entrusted to one of slender understanding. With the increase of information an index becomes sufficiently intricate to demand the best efforts to run it with anything like economy and efficiency. Those who have in view the construction of a card index and are looking about for methods should have in mind the simple fact that cards are only written once, but they may be consulted or referred to an infinite number of times. From the point of view of both cost and efficiency, therefore, the ease of reference is the best criterion. The work left undone by those who write the cards must be done by those who consult them, and at each consultation. Hence when possible this work should be done once and for all when the cards are being written.

NECESSARY OPERATIONS

The operations necessary to apply the method of systematic indexing may be summarized as follows:

1. Index cards: Writing the result of indexing on cards in accordance with uniform rules which will facilitate filing and consulting.

2. Card index: Arranging or classifying the cards according to the plan provided for.

3. Guides: Dividing the cards into classes to facilitate reference and bringing these various classes into relation. To these must be added the practical test of the card index as a whole.

4. Consulting: Tracing cards or sets of cards for the purpose of using the information.

The various operations connected with the filing of the cards may be selected as follows: (a) Verifying and checking the cards to be filed; (b) placing each card in its proper position in the index; (c) attending to guides (this work should be in the hands of one reliable man so as to enable him to observe the utmost consistency).

Before the cards are incorporated into the index the filer should examine each card with a view to checking the work, generally, so as to eliminate errors.

IMPORTANT POINTS

The card-index method aims to bring to a focus complete and concise information concerning each claim filed and furnishes a short cut to all the information about the claim that may be required. By use of signals of various colors attached to the top of a card, any case requiring special attention may be kept constantly before the eye of the claim agent. In this way the claim agent may keep track of cases he should review, with the minimum effort.

Cross reference is of the greatest importance and should be made as perfect as possible. A card-index system will not give the very best results for the money expended if the cards are not properly guided and the fullest advantage taken of the opportunity for cross reference. Guides are just as essential to one consulting the index as street signs are to a pedestrian. To file a large number of cards is as a rule not so difficult as to trace cards wanted afterwards. By connecting related cases, or numbers, strings are tied to the cards, thus making it impossible to miss any. Access is also made easier by the systematic disposition of the information on the cards, limiting the related terms to those which are actually in the index and, by referring from one name or number to another, connecting those which are related by making a cross reference on each. The most valuable feature of the card index is the safeguard it provides against repeaters and fakirs. Such an index properly planned and cross referenced serves as a check against dishonest claimants, doctors and witnesses.

EXAMPLE OF INDEX DATA

The following record of the Hogan case, which was tried and is therefore a matter of public record, was furnished from the record of the Boston Index Bureau. It illustrates the method and extent of the record kept:

Honora Hogan, sometimes called Honora A. and sometimes Nora A. Hogan. 60 East Springfield Street. Case 4815-13 against the Boston Elevated. Tried in Third Session, March 15, 16 and 17, 1915. Whipple, Sears & Ogden for plaintiff. Fletcher, Ranney and Thomas Allen, Jr., for defendant. Verdict for defendant.

Claim thrown by starting of car at corner of Washington Street and Cedar Street, June 23, 1913, at 10.30 p. m. Claimed synovitis of left knee, shortening of left leg and injury to left sacroiliac joint. Dr. Eugene Thayer attended plaintiff. Plaintiff also called Dr. H. H. Germain for consultation and Dr. Charles F. Painter and Dr. DeWitt Wilcox of Boston University Medical School.

Previous accidents admitted on cross-examination by plaintiff:

1. Born in Boston about 1865. Name, Honora McCarthy. Injured when seven years old by a piece of steel run into her left shin. Scar still present.

2. In 1898, corner Dover and Washington Streets, thrown from elevated car on back. Name then Honora Hogan. Number of this case is unknown. She claimed injury to back and spine. Received \$60 from claim agent day after accident.

3. Case 3351-1 against the Elevated. Claimed she was thrown about in elevated train on July 23, 1901. Hurt back and head. Out of work a year. (She being an expert laundress.) Was paid \$700 in settlement. Charles S. French, attorney for the defendant. Feb. 21, 1907.

4. 1908. Name, Honora Hogan. Claim against C. F.

Hovey & Company for a blow on head from fall of electric light globe.

Claimed injury to head and was laid up six months. Charles S. Knowles, attorney for insurance company, and Hardy, Foster & Stone know about this claim. She received \$75 in settlement from the insurance company. At the time of accident No. 4 she lived at 24 Village Street. One Thomas Thornley has the care of this house. Address, 24 Village Street. She lived there five years. She has recently moved to 60 East Springfield Street. She had two or three other addresses between Village Street and East Springfield Street, but could not recall just what they were.

In 1901, time of accident No. 3, she lived at 51 Allston Street, Charlestown.

Her husband, Cornelius Hogan, died about six years ago. She has a son 24 years old, who works for McGann (rent autos) and another son, about 20 years old, who is also working. She is a short woman, about 5 ft. 2 in., weighing now 220 lb. A very voluble and persuasive talker.

BOSTON INDEX BUREAU

The Boston Index Bureau was formed in December, 1905, with twelve subscribers. New members have been added every year and it now has a total membership of twenty, representing four railway systems, three railroads, nine casualty insurance companies, one telephone company, one gas company, one law department (city of Boston) and one law firm.

The file for plaintiff's cards, now including more than 403,000, consists of twenty-three cabinets of eight drawers each, each drawer having two compartments. Two cards are made out for each claimant, one of which is filed alphabetically and the other by street and number.

In the first year the members filed 33,529 claims, which included settled cases four or five years old. Since then they have filed 20,698 in 1907, 15,514 in 1908, 16,063 in 1909, 18,175 in 1910, 18,402 in 1911, 20,061 in 1912, 21,261 in 1913, and 22,421 in 1914. In the nine years a total of 186,664 claims was filed, on which the bureau returned 74,138 references, or 39 per cent. In addition to these regular claims, sent in by subscribers, the bureau has the names of 5500 or more persons which were clipped from newspapers and court records or which were reported to the bureau by investigators, attorneys' assistants, etc. These persons are very likely to turn up as plaintiffs sometime.

The references or items of information consist of previous claims by the same person against the same or other companies; previous claims by persons of the same name or similar names in the same town, district of Boston or neighborhood, and previous claims by others in the same family and by claimants at the same address. The bureau is also filing, with the regular claims, all witnesses for plaintiffs. These names are furnished by the attorney's assistants. A surprising number of previous claims of the witnesses themselves or at their residences have been found. These records are sure to become very valuable. In this file also are about 8000 guide cards, lettered by hand and spaced so as to aid the eye and permit the greatest possible speed and efficiency.

A separate file consists of 5700 attorneys' cards and 9000 doctors' cards, on which are written the names of the claimants and such general information as may come to the bureau's notice. These cards are posted daily from the plaintiff's cards. On these cards also are posted all the facts of any case that has been tried in court. This latter information is sent in by the trial attorneys or their assistants on furnished blanks, giving

the names of the doctors who testified and the names and addresses of the plaintiffs' witnesses. This information is likewise posted on the claimant's card.

When detailed information regarding any particular doctor's case is required by the trial attorney, the bureau picks out the original claim cards and writes out on prepared blank sheets the full details. It has about 250 of these special lists, the use of which has repeatedly been the means of winning or lessening a verdict.

The local jury lists are checked up as soon as the names are available. It is found that 40 per cent of the jurors have had claims in their families or at their places of residence, or have appeared as hostile witnesses against some of the companies.

The references referred to above vary considerably in the percentage on claims filed. The averages have been about 39 per cent, while the references returned to the Boston Elevated Railway average over 70 per cent. This shows that the claims of subscribers whose operations cover a wide territory show a smaller percentage of returns than those which operate in a more restricted territory.

OTHER INDEX BUREAUS

On or about May 1, 1915, the Hooper-Holmes Index Bureau had in its card system nearly 4,000,000 records and each year there is an increase not only in the number of reports received but in the percentage of "duplicates" or references, these accumulations clearly indicating the value of the service to subscribing companies. The Chicago Index Bureau had about 1,000,000 cards on file in April, 1915. The card index of the "Alliance Against Fraud" in New York has more than 250,000 names at present on file. The Philadelphia Index Bureau has a present index of approximately 150,000 names, and the Pacific Coast Claim Agents' Index Bureau has cards as follows: Claims, including suits, 30,560; attorneys, 426; doctors, 638; occupations, 4500; descriptions of injury, 6500. The point to be stressed here, and now, is that the claim departments did not make the index bureaus, but that the card index, as represented by the index bureaus, made the claim departments the formidable organizations to the fakir that they are to-day.

BOSTON ELEVATED EMPLOYEE INDEX

A card index and what it means is further exemplified in the card index record of the Boston Elevated Railway employees. From this record can be found the name, address, age and history of the employee, the nature of the position he holds, the length of time in each class of work, the change to a new position, if any, with the company, together with such information about the employee as may be especially valuable to the claim department when desiring information concerning any past or present employee or claimant.

The card index in addition to giving the history of the new employee shows that he has been notified, as required by law, and is therefore possessed of actual personal knowledge that this company is a subscriber to an insurance company under the workmen's compensation act. In the case of injury to the employee any question of his waiver of notice of his common law rights is a matter of record in the claim department.

All cards in this index are kept separate from the general claim index except that the net information accruing may be transferred in any manner desired. This card index originated in and is maintained in the claim department of the company, under the personal supervision of one of the department men. Since its establishment in 1904 it has resulted in the centralization in the claim department of practically all the information

EMPLOYEES' INDEX—FIG. 1—SHOWING CARD USED TO FURNISH INFORMATION FOR LOCATING EX-EMPLOYEE

in the possession of the company relative to its 8500 employees. It contains at the present time about 60,000 cards. The cards are filed alphabetically, by streets and by all the principal cities and towns in New England and the British Provinces. When an employee leaves the service the record card is removed from the live index and on it is entered the date and reason for going. A past employee file is kept, arranged alphabetically and territorially so that when applications for reference from other employers are requested they may be quickly consulted.

This index gives a street directory of employees, showing whether or not the company has any employee residing in or near a given number in a particular street. It is really surprising to see how often it will be found that one or more employees actually live at or near the address given by a claimant, so that in the event of the claim department desiring specific information of a claimant, his previous history, his conduct since the accident, etc., it is in a position to get available and speedy information almost at first hand. In fact, through this street phase of the record, the Boston Elevated Railway was aided in discovering that a certain claimant, who had given a different place of employment, was actually working for the company. For the benefit of the claim agent or attorney handling the claim in the department a stamp is placed on the lower corner of the case file when it is made. In this may be written the names of from one to three employees living at or near the claimant's residence. This is a great help to one handling large numbers of claims.

The card index is also used in checking up the jury lists (this being in addition to the same use made of the local index bureau before referred to) to ascertain whether jurors or members of their families are present or past employees. Then, too, the various divisions and

EMPLOYEES' INDEX—FIG. 2—SHOWING DATA CARD FILLED OUT AT TIME OF APPLICATION

department heads consult the index for information which they may desire concerning employees. It is used by the treasurer's office to locate men who have assigned their wages or who have had wages trustee by the bureau of audit, etc. All mail addressed to employees which contains no street or number, but is directed in the care of the company, is delivered at the bureau, where it is properly addressed and forwarded by the man in charge. The same is true of the general public and all outsiders who may wish to communicate with or locate any of the employees. The great care exercised in connection with this phase of the index insures minimum "leakage."

Fig. 1 shows a card (3 in. x 5 in.) which, properly filled out, gives the necessary clue by which an ex-employee may be located. This card is immediately sent to the claim department from the department of employment when a man is hired, and is retained in the index after the man has left the service.

Fig. 2 is a card (3 in. x 5 in.) filled out at the time of application. Signature and address are written in ink by the applicant, all other information required being filled in by clerk. The result of eye examination is recorded on the reverse side of this card (Fig. 3). This card is kept on file with the applicant's papers until his references have answered. If the applicant is rejected, the papers are filed away and the card is filed in the "rejected" list. The bureau uses the Lockhart binding cases, and the date of filing is placed on the first line of the card, which corresponds with the date on the binding case in which the papers are located. By simply locating the card, papers of any applicant can be readily secured, even though the application may have been made ten or fifteen years previously. Cards are filed alphabetically.

Cards are made out for every man appointed and for

EMPLOYEES' INDEX—FIG. 5—SHOWING CARD GIVEN TO APPLICANT FOR PRESENTATION TO SUPERINTENDENT OR DEPARTMENT

every badge issued to employees. One card is for the alphabetical live list; the card shown in Fig. 2 (application card) is filed with the same. The second card is a tab card, the tab denoting the last figure in the badge number. Badge number 1248 would require a No. 8 tab. These cards are filed in numerical lists, and when the employee leaves the service, the tab is cut off, the date and the reason for his leaving are noted on the card, and this is filed again in the numerical list. Thus the bureau is able to tell at a glance just what employees have had certain badge numbers for the last fifteen years, and the other information necessary in such cases. Classes are denoted by different colored cards—namely, motormen, yellow; conductor, white; brakeman and gateman, salmon. Miscellaneous employees, such as inspectors, starters, switchmen, employees, etc., are denoted by a salmon card with the position occupied stated.

The card (5 in. x 7 in.), shown in Fig. 4, is used in receiving applications for positions other than for car or train service, such as shop and power station employees, etc. The tab numbers on this card denote the position applied for. In filing this card, all tabs are cut off except the tab number denoting the special position applied for. If there is occasion to look for applications for machinists one would simply run through the cards, picking out those of the proper number.

Fig. 5 illustrates the card (3 in. x 5 in.) that is filled out and given to an applicant for presentation to some superintendent or department. This is kept on file at the office where presented. The card (4 in. x 6 in.) in Fig. 6 is filled in by each new man appointed, and is forwarded to his division superintendent for file.

The bureau also has a card file containing the name of every employee in the blue uniform service, cards of which are arranged by date of appointment into years, months and days of service. A report is made monthly of the number of blue uniformed employees in service by years and classes. This file is also used in sending notices for increases of pay and others for stripes. It is kept accurate by simply taking out the card when a man leaves the service and adding new cards for new appointees.

CONCLUSION

From the very beginning of organized effort in this country for the dissemination of information relative to accident claimants, reckoning from the founding of the Hooper-Holmes Index Bureau and the Alliance Against Fraud organized in New York, and the Index Bureau in Boston, Mass., which was the first local bureau in the country, the leaders in claim department work have been searching for means of co-operation between claim departments and the resultant elimination, as far as possible, of the fakir or repeater. It is universally accepted opinion that a card index is the most efficient method discovered up to this time. The card index may appear insignificant to the uninitiated, but it means that the resources of the combined claim departments of the American Electric Railway Claims Association are being made easily accessible to all member companies who wish information of certain claimants. The field of usefulness of a card index to the association is limited only by the extent of the activities of its members in seeking and exchanging information concerning claimants of whom they have even a bare suspicion. No argument is needed to prove that the hour has struck for intense activity toward perfection of this defense.

JUSTIFICATION OF SAFETY FIRST MOVEMENT

BY ALVES DIXON, CLAIM AGENT EL PASO (TEX.) ELECTRIC RAILWAY

Figures are cold and lack expression, and only the eyes of those familiar with the subject can appreciate the full significance of "Yearly Accident Report of a Great Institution," and farther down: "Reduction in Fatal Accidents this Year over Last, Twelve." The general public reads perhaps the headlines, and hurriedly turns the page until "The Great Ty Steals Home" catches and holds the eye. But you and I, of the inner circle, what do we see? If it is possible to visualize negation we sense a darkened room—a stillness broken only by the moans of a small, tear-eyed woman racked with grief—her hands worn thin and wrinkled through loving service—sobbing children—mourning relatives and a few sympathetic friends. The curtains are drawn, but through the oppressive gloom we see a long, narrow box, covered with flowers, and as the scene changes, we see the little company standing beside an open grave, we hear the hollow sounds of falling clods, the wail of women and the hard dry sobs of men. With outstretched hands, the Man of God is commending another soul into the keeping of its Maker—we multiply this scene by the twelve lives saved, and then, like a glorious flash of light, comes the thrilling thought: To twelve families has this been spared—to twelve wives there are saved husbands who are still full of life and the joy of living—to twelve groups of little children there are still devoted fathers and happy, happy mothers, and instead of the small group, bare-headed beside the new-made grave, and the accompanying sound of a funeral dirge, we see a happy family gathered around an open hearth

BOSTON ELEVATED RAILWAY COMPANY, 101 Milk Street, Boston, Mass.	
191.	
Sirs:	
Under the provisions of Chapter 577, Acts of 1907, I hereby request that I be given seven days work each week until further notice.

and hear from a tiny phonograph on the dining-room table the rollicking chorus of "The Five Fifteen."

And this is just the reduction made in one institution. Multiply this by the great reduction made throughout the country; grasp, if you can, what a saving it means—not only in mere life and limb itself but in the sum total of human happiness—and grasping it, you feel that while your work is done without the blare of trumpets and with perhaps little appreciation, it is none the less effective.

RELATION OF SAFETY TO CONSERVATION

BY B. F. BOYNTON, GENERAL CLAIM AGENT PORTLAND RAILWAY, LIGHT & POWER COMPANY, PORTLAND, ORE.

Safety and its relation to conservation is twofold. It is humanitarian and it is economic. To conserve life, limb and health is the highest ideal of the human race. To conserve efficiency is the basic principle of economic success and an incomparable asset to society. To attempt to achieve that which is humanitarian and at the same time economic, is worthy of the most careful thought and the highest endeavors without stint or selfishness, that can possibly be put forth by society or any unit of society.

In any large organization the first step toward safety and conservation must be with the head of that organization. The president or general manager—whatever title he may use—must be a man of such ability and capabilities that he can gather around him men who will work with him in harmony. They in turn must be men of such a caliber that they can organize their different departments along the same line of harmony—that is, with each and every man working toward the one purpose. When this is done, the greatest step that can be taken along the line of safety from every standpoint is accomplished.

The next step, if the property be a big utility, a street railway, is to establish an employment bureau. The one in charge of such a bureau should be a good level-headed man with exceptional qualifications in regard to reading and judging the character of humanity. The employment of insufficiently trained men is hazardous, and over-confidence in employees breeds bad results. Each and every applicant should be investigated as to his character and habits as well as ability. No matter what position he may be seeking, he should have a thorough medical examination by a competent surgeon, so that if he has or ever had any afflictions, can these be made note of in order to make the record complete. Before the man is allowed to assume his duties in any department, he should be taken through a school of instruction along accident lines by some competent person, preferably a representative of the claim department. After the men are placed in their positions, they should be called together at least once every six months and again be talked to about safety and its relation to conservation, for the purpose of keeping them well informed. Close observation should always be kept of all employees, and wherever a careless or indifferent person is found, he should be relegated to the scrap heap. It should be remembered, too, that earnest investigations of the primary causes of accidents and adequate safeguards all tend toward conservation from a safety standpoint. By making conditions safe, safety and conservation are absolutely brought together.

To show some practical applications of these principles it may be said that in Portland for the last seven years lecturers have covered the public schools once or twice a year, talking to the school children and teachers and distributing safety mementos of different kinds.

Every carman, before he can assume his duties, is sent to the claim department for instruction on accident prevention and the care of accidents. These men are re-instructed twice each year. All of the other various employees are also assembled two or three and sometimes four times a year and talked to along the same lines.

The company has organized safety committees in each and every department from the track greaser to the president's office. It holds safety picnics and safety dances, safety socials and safety gatherings of every name and nature, and tries to make them not only interesting and attractive to the employees and their families but also instructive along safety lines.

Through the safety committees, by the different suggestions that have been sent in from time to time, the company has found and made safe hundreds of dangerous conditions that never would have been reached in any other manner. It never fails to answer and follow up a suggestion, letting the sender know the outcome and, in any case, always thanking him for the interest he has shown.

From time to time prizes are offered to the trainmen on the different divisions for the best articles on some particular line of safety. This has brought forth a great deal of good thought, and some fine papers have been written on safety and conservation.

Once in a while, safety suggestion blanks are placed in the pay envelope of every employee, asking if they know of any condition which could be remedied to make things better and safer, and if they will kindly note any such condition on the blanks and return these. Through this channel a great deal of good has resulted.

Through the various meetings and gatherings and by getting in touch with the employees directly, the company has created a harmonious family touch between the employees and the heads of departments, and that alone has helped greatly toward safety and conservation.

The company had signs painted in various parts of Portland on large billboards (some of them 20 ft. x 30 ft.). These signs, containing different safety slogans, were placed in as conspicuous places as possible and near danger zones. These signs, perhaps, to the layman, look like money ill spent, but the company feels that it obtained wonderful results from the investment. The city has joined in this work by placing between 300 and 400 safety-first signs. They are steel disks 18 in. in diameter, mounted on steel tubing 6 ft. high and painted red with a green center, and are set in concrete just inside the curbing on the right hand side of the street at various distances from danger zones, warning drivers of teams or machines of the conditions ahead. "Sharp Turn," "Steep Grade," "Railroad Crossing," "School, Drive Slow," "Fire Station," "Reverse Curve," "Hospital," and various other things, as required, are painted in clear letters on these little disks.

The company has gone further than the reaching of its employees by inducing the authorities, through the mayor and commission, to appoint a public safety commission. This commission consists of the following bureaus under the following men:

Bureau of Public Safety.—John T. Moore, captain of police.

Bureau of Fire Prevention.—A. M. Churchill, lawyer and chairman of fire prevention bureau of Civic League; E. F. Dowell, chief of fire department; Jay Stevens, fire marshal.

Bureau of Traffic.—H. P. Coffin, chairman public safety committee of Portland Automobile Club; A. S. Kirkpatrick, city traffic engineer.

Bureau of Schools.—L. R. Alderman, superintendent of schools.

Bureau of Transportation.—F. L. Burckhalter, general superintendent Southern Pacific Railway.

Bureau of Electric Transportation.—B. F. Boynton, general claim agent Portland Railway, Light & Power Company.

Bureau of Industrials.—Marshall N. Dana, *The Evening Journal*.

Bureau of Buildings.—Robert L. Withrow, *The Evening Telegram*.

Bureau of Publicity.—Horace E. Thomas, city editor, *The Oregonian*.

Advisory Board.—J. E. Wheeler, McCormack Lumber Company; F. C. Knapp, Peninsular Lumber Company; A. H. Averill, Averill Machinery Company.

Their various walks in the business world show what these men represent. These different safety bureaus have woven a chain of friendship and harmony among the newspapers, the schools, the fire department, the police department, and in fact all of the public utilities. The company has lent and is lending every effort possible to each bureau to accomplish the results which are necessary to be obtained by these various functions, and in this way is breeding a harmonious, good-fellowship feeling between the company and the city and at the same time accomplishing great results along the line of safety and conservation. The children in the schools and the people in the factories, the department stores and various other places are being taught what to do and how to do it in case of fire, and the merchants and the manufacturers are being induced to cover and protect accident hazards. The traffic bureau of the commission, up to May 1, 1915, had 153 automobile drivers arrested for disobeying the traffic ordinance in passing street cars while they were discharging passengers. The bureau of schools has organized safety committees among the school children in each school. All this accomplishes the one great result of setting the people to thinking right along safety lines. Whenever this is done, the battle is more than half won.

FINANCIAL BENEFITS OF SAFETY-FIRST MOVEMENT

BY J. S. HARRISON, CLAIM AGENT JACKSONVILLE (FLA.) TRACTION COMPANY

The subject "safety first," as a means to financial results, divides itself into two sections. The first covers "safety devices," such as rotary gongs, safety gates, life guards and other numerous excellent safety devices which up-to-date street railways have adopted as part of the safety-first plan in order to reduce accident costs. The second section is devoted to "educational methods," subdivided with the operating employees in one class and the public in the other. The educational means employed for these vary materially in point of expense, for the education of the public, embracing the safety education of school children, the use of cuts and catchy epigrams in newspaper advertising, the employment of moving pictures and numerous such devices, does of course necessitate a greater outlay of money than does the education of employees. Just what relation, from a financial saving standpoint, the safety devices installed upon the cars will bear to the educational methods employed would be, of course, hard to compute. It is believed, however, that greater financial results have been accomplished by the use of automatic and semi-automatic safety devices and the giving of more attention and education to employees of the Jacksonville Traction Company than have resulted

from the education of the public by the ordinary means and methods, such as cited above.

As regards the joint result of the two methods the following is pertinent. The Jacksonville Traction Company began actively to equip its cars with safety devices about the time it also inaugurated its safety-first educational methods. In 1914 a trained safety-first man was placed in charge of the movement. This man has been devoting all his time and attention to the work by formulating apt and careful advertisements, working up movements in the different clubs, encouraging the safety-first movement among the public schools, and, of course, delivering regular and practical lectures to the trainmen two or three times a week, using as illustrations actual recent accidents with which almost every employee was familiar. These two methods of safety work resulted in a decrease of 42 per cent in accidents in 1914 as compared to 1913. This figure was compiled after a careful classification of the different accidents under different headings. One can reasonably conclude, therefore, that if there is an average annual expense or loss of \$25,000 from accidents to any electric railway the institution of the safety-first movement will reasonably result in a financial benefit or a saving, on the basis of the population of Jacksonville, of \$10,500.

Aside from the fundamental humanitarian aspect of safety work, the practical business benefits resulting from the institution, in intelligent and systematic manner, of safety first, with every part of the human machinery of the corporation alive and aflame to its importance and thoroughly enthusiastic over the results, cannot but convince the public service corporation itself, as well as the public at large, of the prime importance of such work. Of all the modern ideas and theories advanced in relation to the operation of street railways, safety first has done more to popularize the public service corporations with the public, but more particularly in financial circles, than anything else. Anything which prevents accidents saves money, and anything which saves money necessarily tends to pay dividends. The safety-first movement has ceased to be a theory or an experiment and has become an actual, practical necessity, from the financial as well as the humanitarian point of view. It is the mortal enemy of the ambulance chaser and a real automatic safety device against the worst of all accidents—a receivership.

MOVING PICTURE EXCHANGE FOR A. E. R. A.?

BY F. J. WARNOCK, CLAIM AGENT MAHONING & SHENANGO RAILWAY & LIGHT COMPANY, YOUNGSTOWN, OHIO

If one is satisfied, as many companies are, that public instruction is the final solution of the problem of accident prevention, the question arises as to the methods to be used in imparting such instruction. There are several ways in which this can be done—among them being the use of the press, the distribution of literature and the use of car signs bearing illustrations and printed matter on the subject of safety. But the most powerful medium of all, through which to teach safety, is moving pictures, because these pictures make a deeper and more lasting impression on the mind, and especially on the minds of children, than any other means that can be used. The moving picture comes nearer to the reality than anything in existence, and therefore leaves a more profound impression than anything outside the reality. Furthermore, moving pictures are now so popular that it is not necessary to put forth any effort to create interest in them, for anything that comes in this form appeals to the public.

Those who have used moving pictures for safety work can testify as to their efficacy. The Mahoning & Shenango Railway & Light Company has used them some in past years and has been conducting a regular campaign during the present year, particularly directed to educating school children. During this time, many expressions and illustrations have been received showing the effect that has been produced. Some companies can even show figures to prove that accidents have been reduced following a moving picture campaign. We can only say that we have not, since starting out some months ago, had a single car or wire accident reported among school children to whom pictures have been shown.

Thus far, however, there has been no concerted action. Here and there promiscuously companies have become enthusiastic over the moving picture as a means of instructing the public, but others have not awakened to the possibilities which lie in a campaign of this kind, or at least have not warmed up to the point of putting it into operation. Accident prevention will never come into its own until everyone puts his shoulder to the wheel and co-operates with everyone else. No doubt in time the subject of safety will be taught in the schools as physiology is now taught. In fact, already some states have passed legislation requiring that some time be devoted to this important thing. In Ohio, it is required by law to be taught one hour a month. In New Jersey a law has been passed providing that more time be devoted to it than in Ohio and that it be taught from text books prepared for that purpose.

Yet the time has not come when one can rely upon the teaching of safety through the natural channels. No doubt in time it can be so brought about that teachers can train children to take care of themselves as skillfully as they now train them in other things. When such an atmosphere of safety shall prevail, companies can devote their entire time to their own organization and equipment. But before such an atmosphere can be created a great amount of agitation is necessary, and it falls upon the shoulders of corporations to create and sustain it until safety instruction can be placed upon a natural and permanent foundation. There can be no question about the value of moving picture film as a means to the desired end. The great trouble, however, has been the difficulty experienced in procuring films as well as the expense.

The establishment of a film exchange by the American Electric Railway Association is a school that is entirely possible and practicable. In fact, it offers the only true solution to the problem of country-wide accident prevention, because with it in existence it would be comparatively easy for all companies to engage in this work instead of a few. It has already been tried and found to be a success. On various occasions when our company has sought to obtain films from various sources, and failed, we were able to secure them from an exchange conducted by the National Council for Industrial Safety, whose headquarters are in Chicago, Ill. This council conducts a very successful exchange for the benefit of its members who are engaged in safety work. It is too extensive in scope, however, to suit street railway purposes, as it embraces, together with railroads, every form of industry where men are employed and in which safety instruction is needed. Its films are also directed almost entirely toward instructing employees, while the most important task of electric railways is with the public. At any rate, it demonstrates that the proposition is feasible and leads to the conclusion that if the National Safety Council can do a thing of this kind, the American Electric Railway Association should be able to do it and even with greater success, for the reason that it would be specializing

instead of carrying safety films of every description.

It should not be difficult to establish a film exchange, where safety films could be collected and kept for the use of members. The association could decide upon its location and care for the appointment of the person or persons to take charge of it. Many companies have already made films, being unable to secure them in any other way. These could be put in the exchange, when they are through with them, instead of being destroyed. The contribution of films could be made to entitle the contributor to membership in the exchange. Those who do not furnish any and who desire to participate, could be charged a fee for use in making new reels, to be kept in stock by the exchange.

In addition to this, the influence of the association could be brought to bear in securing and preserving safety films created by the film manufacturing concerns of the country. In past times these films, after going the rounds of the theaters, have been called in and destroyed. On two or three occasions our company endeavored to rent pictures of which it had heard, but received the answer that they had been called in and disposed of. If the negative were preserved, of course new reels could be made from time to time, but as it is now, the manufacturers usually keep the negative and later destroy it.

Another argument for the exchange is that it would mean a great saving in money to members. Those who have used this means of public instruction in the past have been forced to make their own films or have them made. They cannot use the same material over and over again after it has covered the territory in one campaign. They must, therefore, make new films, if there is no place where they can look for them. The films they have just finished using will be suitable for some one else in another locality and others would have pictures which would fit their requirements. Thus the necessity of always making new films would be avoided. The film exchange would serve as a sort of clearing house for the mutual interchange of pictures. It would take a little time to get such a supply as would take care of all possible demands, but with good co-operation and with many patrons any reasonable request could be promptly met. Moreover, films could probably be made for less money under the management of the association than is now the case.

Perhaps the strongest argument in favor of an exchange is that it would remove the greatest obstruction in the way of engaging in this work, in that it would then be convenient and inexpensive for companies to get material. Thus the only real excuse for not carrying on this most effective form of safety campaign would then be a thing of the past. In this way vigorous safety work would become general instead of promiscuous. Some may argue that pictures taken in one locality are not suitable for use in another where different types of cars are in use and different conditions prevail. The same kinds of accidents, however, happen wherever cars are operated and wires are strung, and the principles of safety that should be instilled into the mind are the same the world over. The important thing after all is to get people to thinking about safety, and pictures made anywhere, even if not covering every form of accident, will do this.

The creation of a film exchange would positively render the work of accident prevention more convenient and economical, more general in its scope and more powerful in its influence and effect. It would aid in the work which, wherever it has been tried, has generally elicited from the public commendation instead of criticism and has brought companies into closer touch and into a better understanding with those they are endeavoring to serve.

Echoes of the National Convention

Total Attendance at Convention was 777—"Red Special" Party Had Pleasant and Profitable Days at Los Angeles and Pasadena, Santa Catalina and Yosemite Valley, Now at San Diego—Consolidated Railway Bands Made Hit at Los Angeles

THE thirty-fourth convention of what is now the American Electric Railway Association closed in San Francisco on Friday, Oct. 8, with the presentation of memorial plaques to the American and Manufacturers' Associations. Most of the proceedings were covered in last week's issue, practically all of the remainder being given this week. There remains now only to mention the registration and the details of the return trip.

CONVENTION REGISTRATION FIGURES

Eighty-eight electric railway companies were represented in the registration at San Francisco. The numbers of individuals in attendance were as follows: Railway representatives, delegates, 395; guests, 34; ladies, 132; total, 561. Manufacturers' representatives, 175; guests, 2; ladies, 39; total, 216. Grand total of attendance, 777.

HOMEWARD BOUND

After spending Saturday, Oct. 9, in visiting the exposition, the convention party left in the evening for the Yosemite Valley, which was reached early Sunday morning. That day and Monday were spent in the Valley. Tuesday was Transportation Day at Universal City where an elaborate program had been arranged. Owing to the late arrival of the "Red Special" at Los Angeles this program had to be somewhat curtailed. However, the train was met at San Fernando by representatives of the local committee and the delegates were taken in a special three-car train to Universal City. Attending the local committee was a band made up by consolidating the regular brass bands of the Pacific Electric Railway and the Los Angeles Railway.

At Universal City other convention attendants and delegates, who had reached Los Angeles by other trains, joined the "Red Special" party and a Spanish barbecue was greatly appreciated by the hungry guests. After lunch President Bulla, of the Los Angeles Chamber of Commerce, introduced President Charles L. Henry, of the American Association, and W. O. Wood, president New York & Queens County Railway, who addressed the gathering on the important railway questions of the day. The delegates then inspected the methods used in manufacturing moving-picture films.

The party returned to Los Angeles and Pasadena by special cars of the Pacific Electric Railway. At the New Maryland Hotel, Pasadena, the local headquarters, there was an informal reception on Tuesday evening, with dancing, tendered by the Southern California committee on entertainment.

On Wednesday the party was divided, many going to Santa Catalina Island, others spending the day at points of interest in the cities. The Santa Catalina party comprised about 400 persons and they were accompanied on the boat by the consolidated band. The band also led the way to the luncheon tables on the island where a Catalina sea-food repast was served. The visit to Santa Catalina proved to be a most delightful incident of the trip. The steamer left Avalon for Los Angeles toward the close of the afternoon.

On Thursday the party left Pasadena at 2.30 p. m.

over the Santa Fé, and on arrival in San Diego was taken to the headquarters hotel, Del Coronado, by special cars and ferries, under the guidance of the San Diego local committee. After dinner a formal reception was held and a grand ball given in honor of the guests. At the reception President Charles L. Henry called the guests together and introduced Retiring-President C. Loomis Allen who, on behalf of the "Red Special" tourists, presented a number of testimonials to those who contributed most directly to the success of the tour. A picture was given to Mrs. H. G. McConnaughy, a scarf pin to Mr. McConnaughy, a gold watch to Frank H. Gale and a pocket-book to E. C. Cook, special representative of the New York Central Lines, the presentation being accompanied by expressions of appreciation of the attention which had been shown the tourists.

As this issue of the JOURNAL goes to press the "Red Special" party is enjoying the sights of the Panama-California Exposition. Up to this point the weather on the return trip has been perfect.

Saving Power by Watt-Meter Records

In the ELECTRIC RAILWAY JOURNAL for Aug. 22, 1914, there was given an account of the savings in energy consumption effected by the use of wattmeters on the New York, Westchester & Boston Railway, and the accompanying table shows the record that has been established since that article was published, the figures being given by months since April, 1914, as the previous months were recorded in the article cited. The energy consumptions per car mile, as indicated, include the power that is used for all miscellaneous purposes, as well as for propulsion of the cars. This covers the

Month, 1914	Kw.-hr. per Car Mile	Month, 1915	Kw.-hr. per Car Mile
April	4.61	January	5.53
May	4.35	February	5.46
June	4.38	March	5.22
July	4.34	April	4.41
August	4.33	May	4.24
September	4.33	June	4.26
October	4.42	July	4.24
November	4.91	August	4.20
December	5.63	September	4.15

operation of the auxiliary equipment, the heaters, the lights and the transformer blowers, which are kept running continuously when the atmospheric temperature is above 80 deg. In addition, the power used in switching the cars about the storage yards and in testing them after inspection is reported as part of the overall energy consumption, and it is estimated that the minimum figures obtained in the summer time, when no heaters are used, represent approximately 10 per cent more power than is actually consumed by the propulsion of the cars.

The low record for the summer of 1912, it may be said, was 8.2 kw.-hr. per car mile, this being made prior to the establishment of the present system of competitive records for individual motormen which are made up from readings of the wattmeters on the cars. During the summer of 1913, after the competitive records had been put into effect, the low figure was 4.5 kw.-hr. per car mile. In 1914, as shown by the accompanying

table, the record was reduced to 4.33 kw.-hr., and in 1915 it was brought down still further to 4.15 kw.-hr.

The cars to which these figures apply are 72 ft. long, and with their passenger load weigh about 65 tons. In consequence, the figure for 1915 represents an energy consumption of 64 watt-hours per ton mile, and if 10 per cent is deducted for lights and yard switching the energy consumption becomes only 57.5 watt-hours per ton mile; an astonishingly low figure for the service involved. The average schedule speed for all trains, both express and local, is 26.4 m.p.h. with an average of 0.93 stop per mile.

Under the system that has been established the meter readings are made by the motormen at the end of each round trip and are turned in to the dispatcher on a report form. The inspector, or switchman, who takes the car at the end of the trip also reads the meter before and after the switching operation and turns in a separate report. The two reports serve as the basis for a check whenever that appears to be desirable and as evidence of the accuracy of the reports it is decidedly interesting to note that the total monthly consumption of single-phase power used by the road checks within about 20 kw.-hr. of that obtained by totalling the figures given by the reports of the motormen and inspectors. The monthly totals are of the order of 800,000 kw.-hr.

I. C. C. Holds Valuation Hearing

Steam Railroads Set Forth Their Views of Fundamental Principles in Two-Day Conference at Washington

Depreciation and intangible elements of value were the chief bones of contention at the valuation conference held by the Interstate Commerce Commission in Washington from Sept. 30 to Oct. 2, inclusive. The steam railroads furnished most of the argument, basing their discussion on a 544-page brief previously filed with the commission. The state commissions had not prepared any formal argument. The railroads' case was presented by G. S. Patterson, Pierce Butler, W. G. Brantley and Sanford Robinson. A. E. Helm of the Kansas Public Utilities Commission was the spokesman for the state commissions.

The arguments of the railroads were presented under eight main heads: (1) Reasons for the Valuation Act, (2) cost of reproduction new, (3) unit prices, (4) depreciation, (5) the phrase "owned or used for the purposes of a common carrier", (6) land, (7) property charged to expenses or surplus, and (8) other values and elements of value. One or two other subjects treated in the brief were not reached in the oral presentation.

Mr. Patterson, opening the discussion, said that the recommendations of the commission to Congress for the last twenty-five years indicated that the valuation act was deemed essential: (1) To obtain a trustworthy comparison between present value and original cost, (2) for use in rate questions, (3) in connection with taxation, (4) in determining a proper depreciation reserve, (5) in testing the accuracy of the carriers' balance sheets, (6) in standardizing railway statistics, and (7) in determining whether the railroads are under or over-capitalized. Mr. Butler, discussing reproduction cost new, asserted that this implied original topographic conditions, but construction according to present-day methods and prices and with present facilities other than the railroad itself. It also implied a construction program combining speed and economy. Mr. Robinson held that the unit prices should be arrived at by a consideration of prevailing prices, price tendencies and conditions affecting labor and material markets during a reasonable period of time next preceding and at the

date as of which the valuation is made, due consideration being given to the existence of active railroad construction during that period. Weighted averages for prices should be used.

Mr. Brantley insisted that where there was no deferred maintenance there was no depreciation, and that it was impossible for the numerous field men to "guess" how long a car or a bridge would remain useful. Questions put by representatives of the government indicated that they deemed it mandatory to record the "condition per cent" of the individual parts. The meaning of the phrase "owned or used" was discussed briefly by Mr. Patterson, who held that the question of title was immaterial, only the use signifying. In the case of joint facilities all property should be credited to each carrier regardless of the other users. Mr. Butler, discussing land, held that while the Minnesota rate decision did reject the use of speculative multipliers, it did not conflict with the railroads' views that values should be what it would now cost to acquire the land. He asserted that allowance of unearned increments was fully sustained by law. As to property charged to expenses or surplus, Mr. Patterson stated that the doctrine excluding this was highly destructive to railroad practice. Mr. Robinson conceded that it might be very difficult to estimate intangible values separately, and that the railroads would not as yet undertake to say how they should be determined. He thought they should always have a plus sign unless it were conceded that the railroad ought not to have been built and would not be replaced if removed.

This closed the carriers' discussion. Before adjournment Mr. Helm asked that the states be given a later hearing, but the commission was unable to grant the request. The state commissions were allowed sixty days to file a brief, and the carriers twenty additional days to reply to it. Chairman McChord pointed out that the commission would not render any formal order covering the questions raised, but the progress of the valuation work would necessitate orders from time to time on various matters under discussion.

Chicago Surface Lines Advertise

Immediately following the wage arbitration award on July 16, 1915, President L. A. Busby of the Chicago Surface Lines inaugurated an advertising campaign notable for the character of display and the treatment of the topics discussed. These advertisements began with one-half pages in all the Chicago daily newspapers, the advertisement with new text appearing twice each week. As the campaign progressed the size of the advertisements was gradually reduced until they are now at the minimum or standard size, being 4¼ in. x 9½ in. During this change, however, the interval between the advertisements remained the same. Typical examples of these are reproduced on the following page.

In the beginning the company sent its 12,000 employees a letter which was published in the daily newspapers, the trend of which was an appeal for the co-operation of the trainmen in increasing courtesy to the public. Shortly after this appeared, the company received a letter from one of its employees, the contents of which along with comments, were published as a half-page advertisement. This letter contained a suggestion to the company that in addition to requesting its men to be courteous and the public to file written complaints when they were not so treated, that the public write of any courtesies extended by the trainmen and that these be used as a mark of credit. This letter began a campaign, the motive of which was essentially preaching the gospel of courtesy to the em-

HOW YOU CAN HELP THE STREET-CAR SERVICE

The furnishing of street-railway transportation is a complex human problem, always subject to the limitations of human beings.

The great majority of the trainmen on the Surface Lines are doing the best they can, oftentimes under trying conditions, to handle three millions of people daily and to give everybody good service.

We ask you to co-operate with them in every way you can. There still will be a proportion of errors, misunderstandings, and some inexcusable faults.

We are even more anxious than our patrons to have every one of these faults eliminated from the service.

Help the service all you can by co-operation, especially by reporting both your bad and good experiences. Give us both criticism and suggestion; both will receive prompt attention and every possible effort will be made to give you good service.

804 Borland Building
Chicago

COURTESY IS EFFICIENCY

Courtesy is a part of every man's work. In the street-railway business it is just as important as running on time, collecting fares, issuing transfers or avoiding accidents.

Four-fifths of the complaints against the street-car service in large cities are based upon avoidable deficiencies in the work of employees—such things as incivility, starting cars too quickly, running-by passengers, etc. We say *avoidable* deficiencies because such defects can be reduced to a minimum if the public will co-operate with the management in its efforts to eliminate them.

This co-operation should take the form of reporting both your good and bad experiences. You do yourself and the community a service every time you write us a letter of commendation or criticism.

CHICAGO SURFACE LINES
804 Borland Building
Chicago

YOU ARE ENTITLED TO COURTESY AS A MATTER OF RIGHT

The majority of men have personal standards of courtesy and efficiency which lead them to do their best under all circumstances, without outside pressure or special stimulus.

There are exceptions, however, and we cannot always tell in advance just how well fitted a man is to carry out our intentions toward the public.

Therefore we ask the public to *help us to help our men*—by commendation where it is merited, by criticism wherever it is deserved.

CHICAGO SURFACE LINES
804 Borland Building
Chicago

THE HUMAN EQUATION

There are defects in all human institutions and the defects increase in direct ratio to the number of *human beings* involved in their operation.

It requires fourteen thousand men to operate the surface street-railways of Chicago and three million people are carried daily as passengers.

The service of experts is employed every hour of the day and night to co-ordinate the work of these men in such a way that delays and defects of every character will be reduced to a minimum. To those who are most familiar with the problem of street railway operation in large cities, the wonder is not that the service fails to satisfy every individual every day but that it serves so many individuals so well every day.

CHICAGO SURFACE LINES
804 Borland Building
Chicago

In the modern search for new and expensive luxuries we are apt to overlook the possibilities of everyday, inexpensive pleasures.

A street-car ride in the less crowded hours of the day—or at night—contains *all* of the elements of healthful recreation.

It gives you fresh air, change of scene, a chance to relax and forget your customary surroundings. It will take you to the parks, the beaches, the country or into sections of your own city which are as interesting as a trip to foreign lands.

It costs five cents.
Try it today—or tonight.

CHICAGO SURFACE LINES

AT YOUR SERVICE

The most highly paid body of street-railway conductors and motormen in the world is at your service on our lines.

These men are practically a unit in their desire to give good service. The company is back of them in their effort to be courteous and helpful to the public.

You help such men every time you call our attention to the good work they are doing.

ALSO—

Every large organization of employees includes some men who are not as conscientious or as efficient as the majority. The faults of these men are a constant reflection upon the work of their fellow-employees and give a totally wrong impression of the attitude of the company towards the public.

You can help the service as much or more by pointing out the deficiencies of these men as you can by calling attention to the merits of the others. We ask you to do *both*, in the interest of better street-car service for Chicago.

CHICAGO SURFACE LINES
804 Borland Building
Chicago

ployees and the public. At times these courtesy talks are displaced by advertisements calling attention to the points of interest in Chicago in the day time and at night, particular attention being given to the various kinds of amusements. Under such headings as "Get Acquainted with Chicago," "How to Enjoy the Park" and "See Chicago at Night" these advertisements have attracted much attention. As will be noted in the sample advertisements, occasionally the text is turned to an explanation to the public, stating why it should not expect perfect service because of the complexity of the problem and the limitations of the employees. This campaign of courtesy and service has resulted in a marked improvement in the service and a change in the spirit of the employees toward the public. In other words, the management of the Chicago Surface Lines feels that the expense of this publicity has been justified.

Tests Show Satisfactory Return-Circuit Conditions in Providence, R. I.

On Account of the Use of Concrete Track Base and Other Local Conditions Electrical Welding of Rails Was Considered Impracticable, Although Approved in Principle

Robert L. Brunet, public service engineer, Providence, R. I., has submitted a report to Commissioner of Public Works Walter F. Slade upon electrolysis in the city of Providence, continuing an investigation inaugurated last year. The report points out that since 1914 there has been a general improvement in conditions of this character, marked by the elimination in many cases of serious potential variations between the water mains and the negative return system of The Rhode Island Company. Weak points have been found in the water main system in many parts of the city, but none of these can definitely be attributed to recent conditions, possibly having been affected by stray currents at a former date, with breaking-down points just realized.

The investigation was made in a manner similar to that of 1914,* with the exception that the company did not participate. It expressed its willingness to accept the results of the city as conclusive, suggesting, however, that where marked variations existed or where danger points were indicated it would be advisable to check the data obtained. The scope of the tests included the determination of the voltage variations between water mains and the company's tracks. In addition, current values were taken at many points, and at all the test stations both current and potential readings were taken. Conditions were also noted at bridges and between gas pipes, water mains and rails. Readings of voltages between water pipes and rails were generally taken at fire hydrants.

In many of the streets in the positive district, where a difference of potential exists between underground structures and rails, the voltage variations were in the main found to be of less magnitude than a year ago, and the city's engineers concluded thereby that less current is being transmitted by the underground structures than last year, due to improvement in the return circuits. The maximum current observed in the water mains was less than a year ago. The maximum current observed between water mains and tracks was 40 amp.

In Providence the distances are rather long, and in order to reinforce the rail drainage additional negative return feeders must constantly be installed by the company in order to limit the liability to damage to underground structures, as well as the loss of energy through the high resistance medium. Since July, 1914, the com-

pany has installed a 500,000-circ. mil negative cable between the tracks at the end of the Douglas Avenue line and those on Admiral Street, and another of this capacity between Admiral Street and Branch Avenue. The service troubles discovered within the past year all seem to indicate that the damage was done at a previous date. Within the past year two insulating joints were installed, one in Cranston and one in Warwick. A detailed review of service troubles examined is included in the report.

In last year's November report, immediately after a test car had been employed to determine the number of open and defective joints in Providence, 946 open and 1245 defective joints were recorded, making an estimated total of 13 per cent of the entire number of joints on the system. Following this tabulation, track in fifteen streets was renewed and double-bonded by the company with No. 0000 bonds, covering not far from 700 joints. The total number of joints estimated in use on the entire city system is 20,894, in 92.6 miles of single track. The city recommends that the defective joints be repaired at once, in order to reduce the dangers of electrolysis.

In the 1914 report it was recommended that the Rhode Island Company electrically weld all of the joints in Providence. Investigations were made and several interviews were held with representatives of the Lorain Steel Company, with the result that it appeared a rather expensive task to attempt electric welding under the local conditions, a concrete base for the track being used in a number of cases. The cause of the excessive cost of electric welding in this case is as follows.

With the headway prevailing in certain sections it was found to be impossible to place cross-overs, between which to operate single-track sections, more than 1000 ft. apart. As the concrete base would have to be set up at least a week, this spacing of cross-overs would permit the company to build about 150 ft. to 200 ft. of track per day. Its engineers believed that it would be of no use to build any faster because the 1000 ft. would only be done before the week was up, and work would have to be stopped for the concrete to set before the cross-overs could be removed. Building 150 ft. to 200 ft. of track would call for welding about six joints per night. The company found that it was required to furnish thirty-two joints per night to keep the welder busy or to pay about \$6.50 per hour to keep the welder on the job. Representatives of the welding company conceded the impracticability of using their equipment under these conditions, pointing out that in most cities the street railway does not confine itself to such a short stretch of torn-up track, and sometimes lays temporary track to care for traffic. Where the streets are wide enough the traffic is diverted to parallel lines and a half mile or more is opened up at once. The welding company's opinion is that crushed stone ballast gives better results than concrete, on account of the lack of time in large cities for hardening the latter, the tendency toward hard running and noise, and the liability of corrugation in rails due to excessive rigidity.

H. W. Sanborn, chief engineer The Rhode Island Company, stated in a letter to Mr. Brunet, dated April 21, 1915, that the railway company believes the electrically welded joint to be the best on the market, both mechanically and electrically, but cannot find it practicable to install welded joints on tracks with concrete base. The present agreement of the company with the city requires that tracks be laid on a concrete base, although a modification of this requirement is under consideration. It is recommended that the company investigate in the meantime the electric welding of bonds. The report also favors the installation of permanent pilot wires between selected points on the track

*See ELECTRIC RAILWAY JOURNAL, Nov. 14, 1914, page 1109.

system and the basement of the City Hall, holding that the maintenance of low potential variations will be facilitated and the prompt discovery of abnormal conditions hastened. The report also contains the results of various mechanical tests of strength in pipes removed on account of electrolytic action. Temporary bonding during construction and repair work is also advised, with further test-car observations in the spring of 1916.

Colorado Association Meeting

The thirteenth annual meeting of the Colorado Electric Light, Power & Railway Association was held at Glenwood Springs on Sept. 23 and 24, with a record-breaking attendance. W. F. Raber, general manager Arkansas Valley Railway, Light & Power Company, presided. The program for this meeting was printed in the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 18, page 605.

The special feature of the convention was the presence of three members of the Colorado Public Utilities Commission, Messrs. Aylesworth, Rankin and Herbert.

The president in his address drew attention to the work of the association. "During the past year," he said, "the association has made an earnest effort to bring about the recognition of that fundamental principle of all public utility legislation—the elimination of competition, with complete regulation. The future of the business depends largely upon the inducements offered capital for permanent investment."

On motion of L. P. Hammond, vice-president Colorado Power Company, resolutions relating to the matter of federal control of water power were passed. One of these was as follows:

"Be it resolved, That the Colorado Light, Power & Railway Association in annual convention assembled deprecates and protests against the federal policy contained in the Ferris bill directly contravening the views herein expressed, and against any federal policy denying to the States the right to condemn public lands at not exceeding the fair market value of the lands so condemned, or any policy depriving the States of their inherent right to control and regulate their own internal affairs, or conflicting with such control and regulation by the State."

W. N. Casey of the Denver City Tramway Company, in his paper on "Present-Day Street Railway Problems," treated principally of the matter of taking the public into one's confidence, remarking that the relations of the street railway company to the public embraced a great many of its problems. The jitney was naturally taken up in the discussion as it furnishes one of the pressing problems of the day.

F. V. Rankin, engineer of the commission, gave a paper on "Valuation of Public Utility Properties." He said that the whole theory of regulation is built upon the foundation that private ownership shall be required to furnish adequate and satisfactory service at reasonable rates and shall be allowed to earn a reasonable return upon the fair value of the property dedicated to the use of the public.

Fred W. Herbert, auditor Colorado Public Utilities Commission, followed with a paper on "A Uniform System of Accounting." Mr. Herbert said that any system of accounting must be simple but accurate and effective and designed to show satisfactorily a complete analysis of the investment, the earning and operating expenses, and embody enough detail to enable the commission to determine the profitableness and efficiency of the utility and to enable the utility to make its annual report to the commission in conformity with this classification.

"The Indeterminate Franchise and the Certificate of

Public Convenience and Necessity" was the subject of a talk given by M. H. Aylesworth, member and attorney Colorado Public Utilities Commission. Mr. Aylesworth interpreted the indeterminate permit as the right to occupy and use the streets of a city or a part of the State highways, service being given for reasonable compensation under regulation by the State, and monopoly being assured to the operating company, but with the power vested in the municipality to buy the property through a vote of its people at a fair value to be fixed by the regulating body of the State.

The next paper, "Depreciation as Affecting Valuations and Assessments," was given by Daniel W. Knowlton of Smith, Knowlton & Hatch, attorneys of Colorado Springs, Col. Mr. Knowlton presented one of the best papers of the convention, discussing his subject fully and with complete knowledge. He treated of tax assessments, "sinking-fund" and "straight-line" methods, and left no point uncovered.

Other papers treated of topics of particular interest to the lighting companies.

Following is the list of officers elected: President, John J. Cooper, Denver, Col., secretary Gilpin County Light, Heat & Power Company; vice-president, L. P. Hammond, Denver, Col., general manager Colorado Power Company; secretary and treasurer, Thomas F. Kennedy, Denver Gas & Electric Light Company. The executive committee will comprise H. U. Wallace, Boulder, Col., vice-president and general manager Western Light & Power Company; W. J. Barker, Denver, Col., vice-president and general manager Denver Gas & Electric Light Company; F. P. Wood, Trinidad, Col., general manager Trinidad Electric Transmission, Railway & Gas Company; W. F. Raber (ex officio), Pueblo, Col., general manager Arkansas Valley Railway, Light & Power Company.

The B. R. T. Mechanical Department

A Review of Organization Progress During the Past Decade with Figures Showing Recent Excellent Work in Safety Promotion

The introduction to the fourth quarterly report of the departmental safety committee, mechanical department Brooklyn Rapid Transit System, reveals in a frank, intimate manner the organization of the department and the degree of co-operation between the executive and the rank and file. An abstract of this report as made by W. G. Gove, superintendent of equipment, follows:

Within the ten-year period covered by Mr. Gove's superintendence, all employees have been classified upon payroll standards, with standard rates of pay for each occupation. Previously there was no set standard rate of pay, whereas the new classification provides (except for carpenters, who have a split rate between the 25-cent and 27½-cent grades) for promotion by steps of 25 cents per day. The rates of pay reflect an average increase of approximately 20 per cent within ten years.

There were but few weekly-salaried employees previous to July 1, 1905, and foremen were paid upon an hourly basis. On that date, however, a new schedule and standard classification was inaugurated. Foremen were placed upon a weekly-salaried basis and received a larger salary than when paid upon an hourly basis. In general these salaries have since been increased.

PROMOTION AND A SQUARE DEAL

Knowledge that a few foremen had practiced favoritism to the disadvantage of employees and appreciation that such tactics reflected no credit upon any-

one, least of all upon the management, led to the establishment of a non-partisan system of promotion. An employee can be advanced only by recommendation to the main office of the department, where his record is scrutinized and approval or disapproval obtained. Seniority of service always receives careful consideration, whether for promotion or re-employment after lay-off. This practice is in harmony with the policy announced years ago, namely, that consistent with the work involved, no man for any advanced position would be placed upon the rolls from an outside source where eligible men are already employed.

The weekly-salaried force at the surface carhouse shops now comprises a foreman, an assistant foreman, a responsible night foreman and a clerk, in addition to the regular force employed upon an hourly and daily basis. The elevated shops have also a chief clerk and a clerical force; and at the southern division elevated shop, there is an overhauling department, the head of which reports to the foreman of that shop, independent of the inspection organization. This department is responsible for the overhauling of the entire elevated and subway car equipment.

TIME OFF AND VACATIONS FOR WEEKLY-SALARIED EMPLOYEES

Previous to July 1, 1905, no foreman or employee upon a then so-called weekly basis received time off with pay unless a day off now and then was asked for specifically. At first, one Sunday each month was granted only to the foreman, but now the foreman is expected to be at his shop only on alternate Sundays, the assistant foreman being in charge during the foreman's absence. Upon the elevated lines, the assistants are allowed Sundays off when the foreman is on duty, and upon the surface lines the assistant foremen are granted alternate Wednesdays off with full pay; night foremen upon both the surface and elevated lines receive alternate Saturday nights off with pay; clerks while expected to report at their respective shops in case of emergency, are not ordinarily required to work more than six days per week with Sundays off.

At the large general repair shops, the shops are now closed at 12 o'clock noon each Saturday, remaining closed until 7 a. m. Monday. The foremen and clerks, therefore, except in the shop offices which close simultaneously with the main departmental offices at 1 p. m. on Saturdays the year round, receive Saturday afternoon off the year round with pay, in distinction from the previous practice of working until 4.30 p. m. The hourly-rated employee receives six hours' pay for five hours' work instead of ten hours' pay for nine hours' work.

With the summer of 1907 the company inaugurated a vacation schedule of from one to two weeks (one for employees holding their positions six months and less than one year, and two weeks for a year or more). These vacation privileges were granted to superintendents and foremen and the office force at the three general repair shops, to the office force and heads of the elevated and surface maintenance shops, as well as to all employees at the main departmental offices, including engineers, draftsmen, clerical force, etc. In the spring of 1914 it was decided to include the assistant and night foremen at the elevated maintenance and surface carhouse shops and the clerks at the latter. However, in these latter additional cases, but one week or three days is granted as the one year or six months' tenure of office would indicate.

MILITARY DUTY

Col. T. S. Williams, president Brooklyn Rapid Transit System, has granted leave of absence to all

employees who wish to attend encampments of the State militia. They will receive their regular pay, based upon salary received or average wage earned. The only reservation made is that a weekly-salaried employee must take such tour of camping duty as falling within his vacation, and shall not be entitled to an extension thereof, with pay.

WELFARE WORK AND SAFETY WORK

Upon the earnest solicitation of the superintendent of equipment, the management granted free transportation early in 1913, through the use of appropriate badges, to all employees of the surface and elevated maintenance shops. Upon July 1, 1915, 428 employees of this department were using such badges. All weekly-salaried employees receive one or more books of employees' tickets, according to their position and work. This is another privilege gained by their re-classification from an hourly to a weekly basis.

Wherever possible, lounging and lunching rooms have been and are being provided, wherein smoking is permitted. Other efforts have been made to make the shopman's surroundings more attractive. To this end the company has appropriated several hundred dollars for flowers each spring, and maintains lawns and flower beds wherever the property will permit their introduction. Flag poles have been erected and flags displayed upon proper occasions at several of the shops.

As the work of the mechanical department is laid out from season to season and from year to year, and is frequently planned as much as three years in advance, with the idea of maintaining as constant a force (now about 1700) as possible, it is recommended that—

First: All employees at the various surface and elevated maintenance shops and departments of electrical repairs who may be eligible to membership in the Employees' Benefit Association shall belong thereto.

Second: All employees engaged upon such work at the general repair shops where they have every reasonable assurance of continuous employ, should also be members or should promptly apply for membership.

The pension system inaugurated on Jan. 1, 1910, also applies to the mechanical department.

To promote fair treatment and a thorough understanding of the various duties of all employees, a book of rules was formulated after many conferences with the heads of all shops concerned. This book has been issued to all employees of the maintenance shops, and in certain instances to employees at the general repair shops. Substantial bulletin boards are used to post placards, notices to employees and other essential information, that all may be kept posted as to changes or regulations.

The following recent safety suggestions made by employees have been approved:

Provide respirators to those engaged on work where there is much dust.

Install lights over stairs leading from shop to street at eastern division elevated shop.

Alter connections between the storeroom and the Fifty-second Street surface shop.

Use safety appliances at all shops to hold motor shells open when replacing armatures, fields, etc.

The total safety expenditures to June 30, 1915, were \$7,813.61. The medical inspection bureau of the B. R. T. Employees' Benefit Association shows the following reductions in accidents for the first six months of 1915 compared with the last six months of 1914: Total accidents reduced from 159 to 123—electric burns alone from 102 to 73. Days lost for the latter injuries were cut from 102 to 73.

COMMUNICATIONS

Box-Frame Motor Practice

THE RHODE ISLAND COMPANY

PROVIDENCE, R. I., Sept. 24, 1915.

To the Editors:

By way of contributing to the discussion of box-frame motor practice, begun in your issue for Sept. 4 by an abstract of an article by J. L. Booth of the General Electric Company, I would state as follows:

When we installed box-frame motors about Jan. 1 of this year we planned a method for removing armatures without tipping the motors up on end for the purpose of avoiding danger of accidents and the trouble resulting from oil spilling out of the commutator and armature bearings. Outside of experimental work we have only had occasion to remove one armature which was defective, and we may not have to remove another for a considerable period of time. The method which we worked out is described in the abstract referred to, page 411, this company being the one mentioned as operating GE-200, box-frame motors.

We designed the cast-iron ring carrying the sheave, which is secured to the commutator end of the motor frame by two loose-fitting cap screws. These can be set in place without a wrench. The ring is a fairly loose fit and is flanged so that it is self-supporting.

With a GE-200 motor the armature is of such light weight and the leverage obtained at the pinion end is so great that one man can easily remove the armature from the frame to a point where a support can be placed under the end of the tube, and final removal can be taken care of by the overhead hoisting block, a sheet metal sling being placed around the body of the armature. The cost of the apparatus used is small and so far it has proved satisfactory.

W. D. WRIGHT, supervisor of equipment.

Automatic and Distant-Control Substations

THE EDISON ILLUMINATING COMPANY OF DETROIT

DETROIT, MICH., Sept. 29, 1915.

To the Editors:

Referring to the recent article on the automatic substation by Messrs. Allen and Taylor, I would state that the conditions requiring a distant-control substation (of which the Detroit Edison Company now has three) and those requiring an automatic substation such as that on the Elgin & Belvidere Railway, are quite different. I believe that the Elgin & Belvidere substation is a sequence of a visit by B. J. Arnold to Detroit, during which I casually mentioned to him and later, by his request, showed to him our Rowena Street substation. Mr. Arnold immediately saw that the stopping and starting of the rotary might be made automatic; under control of voltage variation in the d.c. line. He also saw that the conditions of an electric railway would be better served by such automatic starting and stopping; whereas the conditions of a d.c. light and power network would be better served, as in the Detroit case, by control normally from a distant point, becoming automatic only under abnormal conditions.

The essential difference in the conditions is that the daily load curve of a light and power network can be predicted with reasonable certainty and the starting and stopping times of the outlying rotary can be scheduled within narrow limits for weeks ahead. The only reason why the starting cannot be precisely scheduled is that a dark afternoon requires an earlier start, but

the variation to be made for that cause may be left to the discretion of the distant operator. On the other hand the load of an interurban railway varies rapidly within very wide limits, and in an irregular manner. Minor departures from time-table by cars moving in different directions may become cumulative, or may cancel quite erratically, in their effects upon the requirement of current at an outlying substation. A collateral difference is that a considerable variation of voltage is permissible on an interurban trolley wire, and therefore no very fine setting of automatic starting and stopping gear is required. On a d.c. network supplying light, close regulation is customary and the variation of voltage desirable for reliable starting and stopping would be sufficient to cause service complaints. In practice the "distant-control" substation is handled rather carefully for the express purpose of avoiding notable local voltage variations.

There is a future for the automatic substation on railway work. In conjunction with the 1200-volt trolley wire it practically removes the distance limit from d.c. service to thinly settled territory.

ALEXANDER DOW, President.

Taxation of Utilities

COLUMBUS, OHIO, Oct. 12, 1915.

To the Editors:

The question propounded in the ELECTRIC RAILWAY JOURNAL of Sept. 11 by F. N. Fletcher, former member of the Nevada State Tax Commission, namely, "Should utilities be assessed by public service commissions?" naturally opens up the more important question, "Ought utilities to be taxed?"

Mr. Fletcher discusses this second question before he takes up the first. There can be small chance for disagreement with his contention that where utilities are unregulated as to either rates or service and can charge all that the traffic will bear, some form of taxation should be indulged in. Inasmuch, however, as most States attempt to regulate the service and service charges of all utilities, that phase of the subject is of little interest in this discussion.

Mr. Fletcher completely answers this second question when he says at the outset, "In the quite different case of utilities under the intelligent and continuous regulation of public service commissions, it really makes little difference to the utilities whether they are taxed or not." As Mr. Fletcher asserts, such taxes are added to the expense account, "and rates are allowed to cover expenses. The incidence of its taxation," he continues, "is, properly enough, passed on to the consumer." In the old days a utility was allowed to charge more than the service was worth, and the public thought it was doing the smart thing to tax a part of that back into the public treasury. We do not hear so much about this these days, for the reason that as soon as the public began to regulate service and charges therefor, it was discovered that one of the costs was this very charge arbitrarily put upon the service by the public. That cost had to be paid, and the only fund out of which it could be paid was the fund that came from the consumers, who are really the public.

With Mr. Fletcher's contention that utilities ought to be taxed, because only a part of any community uses the service of any one utility and should not receive a lower rate for such service through the exemption from taxation of the property used in furnishing it, I do not agree. It must be apparent that in any community practically all of the people use all of the utilities, most of them directly and all indirectly. Therefore it is too costly to go through the operation of assessing and col-

lecting taxes through service charges, when after it is done practically everybody in the community has contributed. It would be much easier to remove taxation from the service charges, save the cost of assessment and collection, and let everybody contribute to the cost of government in the usual and more economical way.

Of course, the real reason why a utility ought not to be taxed as such, is because its presence in any community enhances the value of the land more than the cost of the utility. The financial benefits of a utility are passed on to the landowner. The consumer has to pay increased rents, which is all right as far as the consumer is concerned, but all wrong if in addition he also has to pay a higher rate for service because of taxes. In other words, the consumer has to pay these taxes twice, once in higher rents and once in higher service charges.

E. W. DOTY,

Former Member Ohio Public Utilities Commission.

Girder and High T-Rail Renewals

NEW YORK STATE RAILWAYS

ROCHESTER, N. Y., Sept. 17, 1915.

To the Editors:

The article which you recently published on "Girder and High T-Rail Renewals," invites considerable study, as there are many points brought up which are worth serious consideration. There are also some statements which presumably will be objected to by a number of the engineers throughout the country.

The wear limit on rails which determines the renewals is a matter that has not been given a great deal of study on account of the truth in the old adage, "The life of the joint is the life of the rail." Another factor which has contributed largely to rail renewal is paving conditions. City ordinances are frequently passed requiring the construction of new pavement, necessitating new tracks even though the rail wear limit has not been reached. In the past, renewals have been made and rail discarded without being worn out because there was sufficient profit to permit this waste. Economic conditions, however, as pointed out in this article, are such that a waste of this kind can no longer be countenanced.

As stated in the article the wear limit of the rail is a variable factor, and different types of rail have different wear limits. For instance, a tram rail, such as Lorain Steel Company's section 73-291, would reach the safe limit of wear when the flanges of the wheels begin riding on the tram. Anything beyond this point is at the expense of safety. This is illustrated in a derailment with which I am familiar, which was the result of the track having a flange bearing on one side, whereas, due to a broken joint and a new piece of rail being cut in, there was no flange bearing on the opposite side. As a result of the flange bearing the wheels had a larger diameter on one rail than on the other, which resulted in the slewing of the trucks to one side and the derailment of the car.

The permissible wear with the groove or trilby rail is considerably greater on account of the guard effect of the groove. However, all things considered, a reasonably safe assumption would be that rail reaches its natural life at the time the flange bearing becomes noticeable.

The article states that rail corrosion is a matter to be considered in rail renewals. While this may be true, there are very few occasions when corrosion is sufficient to warrant renewals. Theoretically the article is perhaps right in the assumption that a well-drained track leads to more rapid corrosion, but actual observa-

tions do not verify this, on account of the fact that rail corrosion is more frequently due to electrolysis than oxidization. Therefore, well drained track is less liable to suffer than poorly drained track.

Recent changes in the chemical analysis have materially increased the wear of the rail. In addition to this the harder rail results in a better joint; that is, there is less tendency to cup at the joint with the high carbon rail than with the rail formerly used. As an example of the wear, measurements taken about two years ago show that on open-hearth rail having 0.70 to 0.90 carbon the rate of wear was 1/64 in. per year; whereas, the rail of a different type having 0.40 to 0.60 carbon wore at the rate of about 1/16 in. per year. This difference may not have been entirely due to the chemical analysis as the track was of a different type of construction and different type of rail, but both were subject to the same traffic.

Another factor pointed out in the article which is worth serious consideration is the type of ballast and other details of construction. Though I have been unable to obtain any figures which would show the relative wear of rails laid on a rigid foundation, such as concrete, as compared with rails laid on a resilient foundation, such as crushed stone, yet I am of the opinion that the author's statement will be substantiated. At least it has been my observation that joints cup less on a resilient foundation than they do on a rigid foundation.

The character of the pavement is a matter which, while having no real bearing on the actual wear of the rail, is frequently the reason for renewals. While pavement is a matter which is now almost invariably a local situation and one which must be decided locally, yet there are conditions of which advantage may be taken. For instance, ten or twelve years ago a number of streets throughout the city were paved, and on account of financial or other conditions existing at that time new rails were not placed in the pavement. As a result these rails were worn out much before the pavement or ties. The situation was met by relaying new or second-hand rail on the old foundation without disturbing it in any way, and relaying the paving surface. This resulted in a comparatively cheap reconstruction of track and gave a construction in which the rail and the ties embedded in the concrete would all last about the same length of time, and like the "One-Hoss Shay" would be all scrapped together.

Another matter in connection with pavement is proper maintenance. With suitable paving gangs the pavement can be repaired from time to time, adding such new brick or stone as are necessary, with the result that the life of the paving can be so increased that the rail may be worn out.

Another important factor brought out in the article which affects the track as well as the pavement is the drainage. Inasmuch as dry soil has considerably greater bearing power than wet soil, proper drainage will increase the bearing value of the soil, and by increasing the depth of the ballast, the area of weight distribution can be increased so as to produce a uniform distribution of weight on the sub-grade or soil. This depth of stone or gravel ballast obviates the necessity of putting in a sub-base of concrete under certain soil conditions and also contributes to good drainage.

A matter in connection with the crown of the streets which affects the rail wear but which is not brought out in the article, is the practice in some cities of placing the devil strip rails 1/2 in. or 3/4 in. higher than the outside rails so as to assist in giving the street a crown. This method of laying track is not satisfactory on account of the fact that it increases the weight on the

outside rail, increasing the rail wear in addition to increasing the wear on the equipment, particularly with single-end cars. In addition to this there is an increased tendency to create wide gage in track, and as soon as this wide gage obtains there is marked tendency for the cars to nose or sway. Therefore this practice is an increasing factor in the wear of the rail as the track becomes older.

Relative to the formula which the author of the article in question has suggested to determine the proper time for renewal, it would seem to me that this is rather complicated and that it includes a number of factors which need not be taken into consideration. For instance—the taxes, at least in the State of New York, are based upon the franchise value and this has nothing to do with the cost of the track. Another is that the distribution of accounts, whether betterments or operating expenses, has little or no bearing upon the economics of the situation, and it would seem to me that a simpler means of determining the proper time for replacement of rails would be as follows:

Total estimated cost of replacement with old rails less the estimated scrap value, divided by the estimated life of old rail, plus the estimated average annual maintenance on the old track, plus the annual interest on the estimated cost of replacement with old rails, or

$$\frac{R_1 - S_1}{L_1} + M_1 + I_1$$

equals the total maintenance and fixed charges per year with the reconstructed old rail. This figure, the total maintenance and fixed charges per year, should be compared with the total maintenance and fixed charges per year on track reconstructed with new rail, which is arrived at as follows:

Total estimated cost to replace track with new rail, less the estimated scrap value, divided by the estimated life of the new rail, plus the estimated average annual maintenance per year, plus the interest on the estimated cost to replace track with new rail, or

$$\frac{R_2 - S_2}{L_2} + M_2 + I_2$$

The latter figure equals the total annual maintenance and fixed charges per year with the new rail. When the total maintenance and fixed charges per year with the old rail are greater than the figure arrived at with new rail, then new rail should be used in the replacement. When the opposite condition obtains old rail should be used in the replacements.

In considering this comparison of the estimated total maintenance of each type of construction different factors can be used. For instance, in case the old rail is to be used it might be possible by co-operating with the city authorities to convince them that a cheaper type of pavement would be suitable under the conditions, which would result in that the total estimated cost of replacing old rail would be a less amount, and therefore might favor the use of the old rail. As an example of this, during the present year our plans for reconstruction include some tracks in which the ballast, ties and other material are to be renewed except that the brick which is now in place when taken out will be sorted over and that which is suitable will be relaid. During the past two or three years on construction of this kind we have found it possible to use from 25 per cent to 50 per cent of the old brick which has resulted in considerable saving without detriment to the new construction.

Another street we have planned for improvement this year is outside of the city and the rails have been worn for eight or nine years. This track was originally laid with gravel ballast, 7-in. rail and mac-

adam pavement. It is now proposed to renew the pavement outside of the tracks with brick, and the construction in the track is to be the same ballast with the necessary tie renewals and the same rail, the foundations not being disturbed in any way as the grade of the street remains the same. It is proposed to carry the brick pavement outside of the legal width up to the rail. Between the rails and in the devil strip it is proposed to use a concrete pavement which will be coated with Tarvia. In addition to this there will be placed a Medina block header adjacent to the gage side of each rail so as to take the extra wear due to vehicular traffic along the rail. It is estimated that the concrete pavement under the existing traffic conditions will last about the life of the rail, and this will result in the entire track and pavement being worn out at approximately the same time. Since this stretch of track is adjacent to the city it is probable it will be taken inside

CHARACTERISTIC CURVE OF SINGLE-TRACK MAINTENANCE FOR TWO STREETS WITH DIFFERENT TRAFFIC CONDITIONS

the city within the next few years and that sewers, water mains, etc., will be placed. The tracks may therefore be reconstructed without serious loss.

Matters of this kind can only be arranged through co-operation with city and state officials because when these men appreciate that the railway companies are interested in the best results possible they will be willing to make what may seem to be concessions in order to gain the greatest good for the greatest number.

Another factor in the comparison is the estimated maintenance per year. It is a well-known fact that the maintenance increases with the age of the track so that the curve representing the annual maintenance charge would not be a straight line. An example of this is shown in the accompanying cut which is taken from actual maintenance costs on certain streets. It will, therefore, probably be necessary in order to obtain the maintenance item per year to take the accumulated maintenance for the entire life of the track and to divide this by the life so as to obtain an average annual maintenance. This figure could only, of course, be arrived at through a study of the maintenance charges on individual stretches of track, taking into consideration all of the variables, such as traffic, type of construction, etc.

Relative to the conclusions submitted in the article in question, certain of them are questionable. For instance, the conclusion that appears as No. 5 refers to the responsibility of heavy vehicular traffic for rail renewals, but it would seem to me that, with proper maintenance and proper selection of pavements, this

condition need not obtain. The same criticism can be made of No. 6, whereby means of proper selection of pavement and rail and with proper maintenance, no one factor could require the renewal of the entire structure.

Relative to the amount of head reduction for groove and girder rails, it would seem that 50 per cent is too large for the older types, 30 per cent being more properly the safe limit. This difference in the per cent, however, may be due to a difference of opinion as to what constitutes the head of the rail. Fifty per cent may be a reasonable figure for wear on T-rails, but it is rather questionable if this amount of rail wear can be obtained where other factors such as the shape of the head, gage of the track, joints, etc., may not be such as to require renewals. On the whole this is an article which covers a field which has not been given a great deal of consideration from the press, and it would be very interesting if a number of the engineers throughout the country would give their opinions and experiences with regard to this matter.

D. P. FALCONER,

Engineer of Maintenance of Way.

Fair Overhead Charges Allowed

Commission Sets 20 Per Cent for Contractor's Profits, Engineering Supervision, Etc., and 12 Per Cent for Preliminary and Development Expenses of Bronx Gas & Electric Company

The recent decision of the Public Service Commission for the First District of New York, in passing favorably upon the application of the Bronx Gas & Electric Company, New York, for permission to fund \$16,880 expended from current revenues, took up the question of the company's valuation and the inclusion therein of allowances for certain intangible values—i.e., 20 per cent for contractor's profits, engineering supervision, contingencies and incidentals, and 12 per cent for preliminary and development expenses. The opinion, which was rendered by Commissioner Robert C. Wood, was approved on Sept. 28 by a four to one vote. The company produced no data upon which to base reasonable allowances for these items, and as the early records were missing, estimates based on general knowledge and experience had to be made.

According to Commissioner Wood, it was asserted that the allowance of 20 per cent for contractor's profits, engineering supervision, contingencies and incidentals over and above the net cost of the property, was too large and should be reduced to 10 per cent. In his opinion, however, during the construction period of public utility corporations many and varied expenses have to be met, contractors must be allowed a fair profit, or, if the work is done by the company itself, proper supervision must be provided for. Engineers must be employed to supervise construction and installation of plant and equipment, and a sum must be set aside to meet the unforeseen contingencies that are bound to occur in every undertaking of this character. In appraising the plant and equipment, therefore, a fair allowance should be made for all these items. Allowances of 10 per cent for contractor's profits, 5 per cent for engineering supervision and 10 per cent for contingencies and incidentals are figured on a most conservative basis when taken individually. In this decision they are only taken collectively in the form of 20 per cent. In several cases as decided by this commission, a larger amount was found to be justified, but the figure now approved represents a conservative average of the previous allowances made by this and other commissions. In the Kings County Lighting Company

case (2 P. S. C. R. 659) an allowance for these items of 21.6 per cent arrived at in this manner received the approval of the Appellate Division.

Similar arguments are said to apply to, and the same principles should be followed in, the allowances that should be made for preliminary and development expenses. The Bronx Gas & Electric Company was incorporated in 1893 and began business in 1895, when the electrical industry was in its infancy, and the gas business was in a comparatively crude state as compared with that of the present day. The company's franchise rights and field of operations covered a sparsely-settled territory extending over a large area. The company had before it the question of its ability to market its bonds and so raise funds to meet the requirements of the territory it served. The commission has recognized that public utility companies, especially those beginning business in new territory, are entitled to a legitimate sum for certain expenses that must be met before the plant can begin operation. The present allowance of 12 per cent is simply a conservative average of allowances made in similar cases by this and other regulatory bodies.

Commissioner Wood calls attention to the fact that the decision recommends the deduction of \$137,722 for accrued depreciation from the net cost of the property. When the statement is made that \$267,264 is added for overhead expenses (viz., \$160,243 for contractor's profits, engineering supervision, etc., and \$107,020 for preliminary and development expenses), it should also be stated that the sum of \$137,722 is deducted for accrued depreciation on tangible property other than land. Instead of adding \$267,264 to the basic figures of the engineers, the net addition is but \$129,542. The total net overhead charges recommended to be allowed are therefore but about 8 per cent of the present capitalization of the company and about 13 per cent of the capitalization as of Dec. 31, 1908. When the \$137,722 recommended for accrued depreciation is deducted from the \$160,213 allowed for contractor's profits, engineering supervision, incidentals, etc., the amount to be added to the net cost of the property is but \$22,523. This sum is about 2½ per cent of the capitalization of the company as of Dec. 31, 1908, and about 1½ per cent of the present capitalization.

A considerable portion of a supplementary memorandum to Commissioner Wood's decision is devoted to showing that the actual overhead charges in the New York & North Shore Traction case (3 P. S. C. R., First District, N. Y. 67) amounted in both instances (contractor's profits, engineering supervision, etc., and preliminary and development expenses) to more than 20 per cent. Commissioner Haywood had stated that these charges amounted to only 9 per cent.

Jitneys in South Bend, Ind.

The Chicago, South Bend & Northern Indiana Railway has been keeping a careful tabulation of the number of jitneys operating in South Bend. Notice is taken not only of the total number of jitneys each day but also of their license number, so that it is possible to keep track of the number of days which each car runs. A graph of these data during July was published on page 399 of the issue of this paper for Sept. 4. The figures for August show that on Aug. 31 there were thirty-eight jitneys in operation, but that since July 1, 336 different cars had been engaged in the service. In other words, 198 gave up to every thirty-eight which stayed in. Aug. 31 was a Tuesday, which is an average day for the jitneys. Saturday is the day of largest traffic. On that day the number is about fifty. Monday seems to be the low day of the week.

Snow Plow and Life Guard Combined

RY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA)
SERVICE COMPANY

All cars of the Sioux City (Iowa) Service Company are equipped with a device which has served as a snow plow during the winter months and as a life guard at all times. This combined plow and guard is made of 3/16-in. sheet steel reinforced with 3/8-in. x 2-in. x 2-in. angles. The plow wings distend at an angle of about 120 deg., and they are 14 in. high at the ends and 8 in. high at the nose. The feature of the plow is the method of mounting it beneath the vestibule platform. The nose is pivoted in a fixed position 4 in. above the top of the rail. A trip operated by the motorman from

COMBINED SNOW PLOW AND LIFE GUARD

the vestibule floor releases the ends of the wings, which drop to the pavement surface. These wings drag along the tops of the rails clearing away the snow and, in case an obstruction is met, they merely slide over it. In other words this plow readily adjusts itself to any inequalities in the street surface and, at the same time, clears away the snow down to the tops of the rails. The method of pivoting the plow nose is by way of two brackets or hangers which in turn support the ends of a 3/4-in. x 4-in. bar with the ends rounded to form the pivots. This combined plow and wheel guard has been in service for a number of years and has been found very effective. A view of one of them is shown in the accompanying illustration.

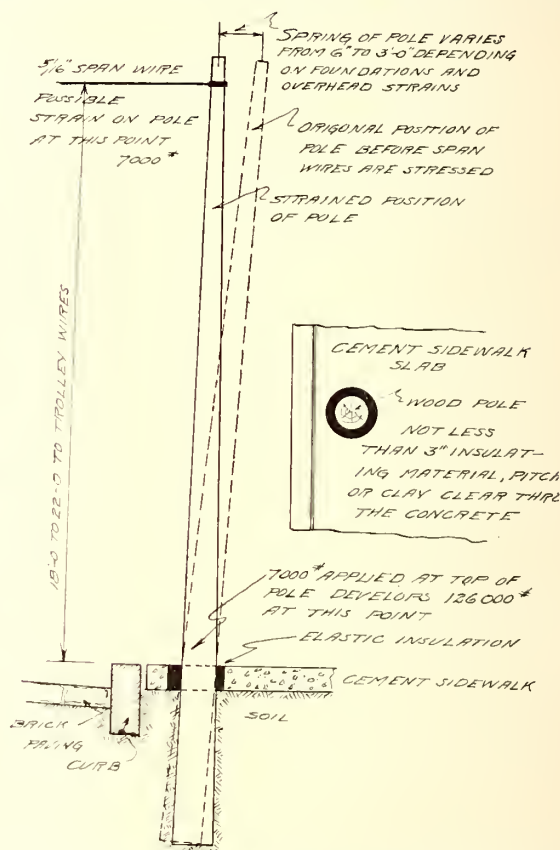

Destruction of Cement Sidewalks by Trolley Poles

BY CARL H. FULLER, GREENSBURG, PA.

It is not an uncommon sight to see long stretches of cement sidewalks disfigured by being badly split, checked and broken, or curbing pushed out of line where the slab surrounds and comes in contact with trolley poles, public service poles, fire hydrants and such obstructions, which extend through the sidewalks to various depths in the soil below. Unquestionably this defect is most

noticeable around the trolley poles of the electric railway companies.

The writer has long been an advocate of 3 ft. or more of street lawn between the sidewalk and the curbing, which provides ample space for locating these inevitable obstructions where they will do the minimum of damage and at the same time affords an opportunity to beautify the street by planting trees therein. Unfor-

SKETCH SHOWING STRAIN APPLIED TO CEMENT SIDEWALKS BY TROLLEY POLES AND METHOD TO PREVENT DAMAGE

tunately, the street railway man has to adjust his work to existing conditions by setting his poles through cement sidewalks already constructed and extending to the curb line. To do this, he chips a hole in the cement walk, excavates for and beds his pole, then finishes the job by restoring the cement walk around the pole. Later the sidewalk becomes checked and broken around the pole and the company is blamed for careless workmanship. The railway company is not always to blame for this condition as the walk is frequently laid after the poles are set, the mechanic doing the work also cementing tight around the pole, when in a short time the same defect appears.

In several instances coming under the writer's observation either the public has demanded, or the railway company of its own initiative has sought to avoid this trouble by employing various expedients that usually have failed to recognize the threefold basic cause of the

trouble. However, the cause is not far to seek and the remedy is neither expensive nor difficult to apply.

The sidewalk slab contains within itself its own most destructive agency, expansion, and competent sidewalk men endeavor to provide for this, when laying walks, by the use of various types of expansion joints. They usually overlook the fact that any pole or other object extending through the slab to any considerable depth in the soil below, being thus anchored, acts effectively to destroy the thin slab of concrete by preventing its lateral movement while undergoing expansion. That this lateral movement is considerable and of enormous force is evidenced by its frequent overturning effect on adjacent curbing. The writer knows of one instance in Guthrie, Okla., where a 200-ft. stretch of continuous sidewalk, effectively anchored at one end, moved uphill under the expansive action of the rising summer temperatures until the upper end projected fully 6 in. over the curbing. Had there been poles in this walk they would have been sheared off at the sidewalk line or portion of the slab surrounding them would have been broken.

Another cause of checking and breakage may be traced directly to the pole itself. The majority of the poles used are of wood, and their swelling alone, due to varying conditions of moisture, is sufficient to crack the thin slab of concrete surrounding them. An evidence of the immense expansive power of wood when swelled with moisture is seen in one of the methods used in quarrying fine building stone. In this a series of holes, sometimes several feet in depth, is drilled along the desired line of cleavage, and the holes are filled with tightly-fitting kiln-dried wood plugs which are then saturated with water. As this process will split huge slabs of the hardest granite, the thin slab of concrete, not being designed to withstand tensile strains, cannot be expected to resist such forces.

The third, and possibly the most destructive, agency where trolley poles are concerned is indicated by the location and direction of the cracks in the sidewalk slab surrounding them, and may be traced directly to the highly stressed overhead work which the pole carries. When the pole is set, the top is inclined from 6 in. to 3 ft. from the vertical and away from the center line of the track. The poles are then connected in pairs by 3/16-in. to 3/8-in. stranded span wires 18 ft. to 22 ft. above the ground, and by means of tackle pulled nearly vertical. A 5/16-in. span wire is capable of producing a 7000-lb. pull which, if the pole is capable of withstanding such a strain, induces a permanent set or spring in the pole with a possible reaction at the sidewalk line up to 125,000 lb. The railway man counts on the resiliency of his poles to take up the expansion and contraction of his overhead, due to the climatic changes of temperature. Between the cool of midnight and the heat of noon, the tops of a pair of trolley poles may vary as much as a foot in their relation to each other, and this movement, to a lesser degree but greatly multiplied in stress effect, is communicated to the thin sidewalk slab that surrounds the pole, and which, being of a comparatively unyielding composition, breaks at the point of contact.

As a remedy, when building new sidewalks around such obstructions, the writer usually specifies that a space of approximately 3 in. be left clear of concrete around the poles, giving them an opportunity to perform the functions imposed by saturation of pole, overhead strains or expansion of concrete. This may be readily effected by wrapping the pole at the sidewalk line with several narrow thicknesses of Carey "Elastite" (the material is 1/2 in. thick.) or other expansion filler before concreting, or a circle of tin may be used,

leaving the desired clearance around the pole to make a form to finish the concrete against. If the latter method is used, care should be taken to fill the metal form with sand, clay or pitch to prevent a careless workman from defeating the object of such precautions by disposing of surplus cement in the interstice. When it is desired to prevent water from entering the joint between the pole and the concrete a soft pitch makes a good insulating material as it readily accommodates itself to any slight movement of the pole or the concrete.

When a hole is cut in an old sidewalk for the purpose of setting poles, the same precautions should be observed before patching the paving, except that the pole may be set closer to the concrete on the side away from that to which the strain is applied, making the insulation eccentric around the pole. Where poles have already been set with the sidewalk laid flush to the pole, any further development of cracks may be prevented by chipping out a 2-in. or a 3-in. ring through the concrete around the pole and filling the interstice with pitch.

The writer does not advocate such insulation as a cure-all for defects in sidewalk work, but experience and observation have demonstrated that such protection will eliminate the damage done by trolley poles.

Handling Box-Frame Motor Armatures in Minneapolis

The Twin City Rapid Transit Company, Minneapolis, Minn., decided to buy box-frame motors in preference to split-frame motors ten years ago and has had no cause to regret that decision, as the box-frame motor has proved in every way superior to the split-frame motor. The practice of the company in handling box-frame equipment is as follows: When it is necessary to make repairs on a motor or truck, the car body is lifted

BOX-FRAME MOTOR ARMATURE MOUNTED FOR TRUNDLING

from the trucks by means of an electric crane, and the trucks are sent to the truck shop in trains of six or ten.

The company's truck shop is well equipped with electric hoists, but has no pits in the floor. When it is necessary to make repairs on a motor, it is lifted from the truck and another motor is put in its place. If it is necessary to remove the armature from the motor for repairs, the waste is removed from the oil boxes, two bolts are removed from the motor head on the pinion side, and eye-bolts are screwed in instead. The motor is then placed on end by means of a small electric hoist and the head is drawn loose from the frame by turning in the two eye-bolts. This is done by two men walking around the motor and using bars in the eyes of the bolts. The armature is then lifted out

of the frame without taking off the pinion or head. When the armature is lowered to the floor the end of the armature shaft enters a hole in a wooden wheel, made of 2½-in. plank. The armature is then tipped down on its side and can be rolled on the floor by means of the motor head and this wooden wheel. An accompanying illustration shows the armature with head and wheel. When the armature gets to the winding shop a pinion puller is used to remove the pinion, the head is taken off, new bearings fitted, etc.

The time required to do this work is but little longer than that required to describe the operation.

Making Interurban Cars Comfortable

Recently a desire to provide increased comfort for passengers and a more compact seating arrangement induced the Milwaukee Electric Railway & Light Company to remodel a number of its interurban cars. Wider seats were installed and the space between them was increased, involving a reduction in the car capacity from sixty-four to sixty-two seats. The cars were also rearranged with two regular passenger compartments in place of the three which were provided in the original cars, this change giving a seating capacity of forty in the main passenger compartment. In the new plan, also, transverse upholstered seats for seventeen passengers were substituted in the smoking compartment for the longitudinal slatted seats of the old car.

The changes in the arrangement of the compartments were effected by moving the bulkheads, and at the points from which these bulkheads were removed cast-steel angle reinforcements were provided to maintain the

MILWAUKEE INTERURBAN CAR—ARRANGEMENT OF ORIGINAL CAR

MILWAUKEE INTERURBAN CAR—ARRANGEMENT OF REMODELLED CAR

transverse stiffness of the body. No changes were made in the arrangement and location of the motorman's cabs, these being unique in that sliding doors in the partitions and trapdoors in the floor permit them to be utilized for the entrance and exit of passengers when either is at the rear end of the car. They are located in the diagonal corners of the car body, and the original exits opposite each are permanently closed.

The new seats are of the Walkover type and are 38 in. long as compared with 35 in. for the old seats, and the spacing has been increased from 29 in. to 33½ in. The new seats in the passenger compartment are upholstered in plush and those in the smoking compartment in rat-tan. The inside width of the car body was slightly increased by recessing the panels between the window posts, but this did not make up for the increased seat width, which also necessitated a reduction from 24½ in. to 20½ in. in the aisle width. During the winter months one of the seats in the smoking compartment will be removed to make room for the heater equipment. The toilet room has also been moved from one end of

the car to a point beside the bulkhead between the smoking and main passenger compartments.

Changes in the lighting system were also effected in a new scheme including ten 56-watt Mazda lamps with reflectors, installed along the center line of the car. These are spaced at regular intervals and wired so that the alternate lamps are in the same circuit. In addition the composition flooring of the old cars was resurfaced and covered with a cocoa matting, and the old inside finish was restored wherever it was in good condition, all of it being thoroughly scraped, stained and given three coats of varnish. It is contemplated that all interurban passenger equipment will be remodeled after this plan.

Steel Ties on a Cleveland Bridge

The Brooklyn-Brighton Bridge, Cleveland, is a reinforced concrete and stone-trimmed structure 2200 ft. long, which will carry two tracks for the cars of the Cleveland Railway and for several interurban lines. In connection with the selection of the type of support for the 7-in., 95-lb. Lorain rail that was used, Charles H. Clark, engineer maintenance of way Cleveland Railway, decided that International steel ties of the "twin" type would be preferable to wood inasmuch as a clearance of only 4 in. between bridge floor and rail base was available. The Cleveland Railway, it may be said, was already familiar with these ties because some 15 miles of track had been equipped with them since the spring of 1910, the first installation, which is in open track,

STEEL-TIE LAYOUT OF A CLEVELAND RAILWAY ON BROOKLYN-BRIGHTON BRIDGE

unlike the following ones, and which carries both city and interurban cars, having required no maintenance to date.

The twin ties on the Brooklyn-Brighton bridge are laid to the standard spacing of 6 ft. centers with the usual eight clips per twin-tie. This spacing gives a lineal support to 50 per cent of the rail. The 13-in. x 36-in. plates which constitute the main bearing surface of the tie rest on 4 in. of concrete between the base of the rail and the bridge floor, and the channels, themselves, rest practically on the bridge floor, the track being concreted to about 1 in. above the ties. This concrete in turn is covered with a 1-in. sand cushion and then paved with granite block.

The electric railway system in Rosario, Argentina, which was financed by Belgian capitalists, has modern equipment and service. The cars run only in one direction on most streets. There are altogether 100 miles of street car lines in the city, all operated by the one company.

Switchboard Fittings

The General Devices & Fittings Company, Chicago, has recently furnished switch and bus support equipment for three of the largest power stations to be built, and a description of a few of the new designs

that were used should be of interest. Fig. 1 shows a back-connected, posi-

per; the blades are extra hard drawn pure blading copper; the handle fork and entire lock are of Hertz non-magnetic metal; and the handle itself is of black fiber made from rings turned to size and treated. This switch is made in sizes up to 16,000 amp., all sizes above 10,000 amp. being equipped with double cushion locks and interferences.

In Fig. 2 is shown a special-extra-heavy switch for 2000 amp. and 15,000 volts equipped with positive snap lock and vertical terminals for bus insertion. The patent bridge base is a continuous unit, giving an assurance of absolute alignment. The clip blocks are one-

FIG. 1—LARGE-CAPACITY SWITCH

FIG. 3—PIPE MOUNTED SWITCHES

tive-lock-type switch with a rating of 6000-amp., 600 volts, 60 cycles, with a 20-deg. Fahr. limit for temperature rise. This is said to be the only switch ever provided with a positive lock that is thrown in or out with the switch handle. The studs are milled from solid copper forgings and slotted 7 in. deep for bus insertions. The studs can also be slotted for vertical buses.

piece solid copper forgings milled and slotted to micrometer size. Any switch can be arranged, if necessary, for mounting upon pipe frames, either single or double pipe, and on the horizontal or vertical plane for front-connected switches and on the horizontal plane only if the switches are back connected.

Such a mounting is illustrated in Fig. 3, which shows a triple-pole, locking-type switch equipment mounted upon a horizontal pipe frame. These switches are rated at 2000 amp. and 600 volts, 60 cycles. They are equipped with positive interference locks and are the first of their kind to be made. The bridge bases permit of vertical adjustment, and barriers are provided between switches, although these are not illustrated.

A disconnect-type support for a 15,000-volt expulsion fuse is shown in Fig. 4. These supports are also built for cartridge-type fuses and may be mounted on bridge bases. They are furnished for both flat and pipe mounting.

FIG. 2—DISCONNECTING SWITCH

FIG. 4—EXPULSION FUSE SUPPORT

All contacts are ground to reduce the millivolt drop to the lowest possible point. All hardware, bolts, nuts, spring washers, etc., are of phosphor bronze, turned from solid rod. The clips are of Sigamond spring cop-

per. Fig. 5 shows a special three-phase bus support for 600-volt service. In this all metal except the base is Hertz non-magnetic metal, and the bolts are phosphor bronze, machined from solid rod. The support is made in all

sizes and voltages and to support up to nineteen bars $\frac{1}{4}$ in. x 10 in. Any combination of mounting that may be desired can be arranged. This support is adjustable to any need and the weight is 320 lb.

A 15,000-volt special-extra-heavy clamp-type bus support for holding heavy vertical buses is shown in Fig. 6, this being arranged to be mounted in a 36-in.

FIG. 5—THREE-PHASE BUS SUPPORT

FIG. 6—COMPARTMENT SUPPORT FOR BUS

compartment. A similar design may be arranged for $3\frac{1}{2}$ -in. copper tubing. This is adjustable all around, and can be removed from the bus with power on bus.

Fig. 7 shows a single support to take one phase leg from the big support shown in Fig. 5, this being arranged for mounting on two parallel pipes. It is built to clamp the bus and is not intended for contact or taps.

All porcelain used in these devices is tested at 280,000 cycles and is also given a combined high potential and high frequency test before shipping, this test being made with all of the regular hardware and equip-

FIG. 7—SINGLE-BUS SUPPORT

ment in place. All shipments are packed in cartons, each unit complete. The switches are designed with a guaranteed millivolt drop, on both the heavy capacity and the central station standards. Copper forgings are used for all switch work and terminals. The porcelain

used has not an equal for design or strength, and is guaranteed to be made only by the wet process.

Lamp Grips for Screw Sockets

A great deal of trouble and inconvenience has been experienced in the use of lamps in sockets when installed where they are subject to vibration. This is particularly true in factories using high candle-power lamps where heavy machinery is operated, and on electric cars. Constant jarring and vibration cause lamps to unscrew or "back off" from the base contact so that the circuit is broken and often the lamp falls.

To overcome this difficulty, the Bryant Electric Company has developed a very effective lamp grip. In this new form of socket, the threaded copper portion that receives the lamp is slotted on two diametrically opposite sides in such a manner as to provide two tongues which are flexible. Two flat steel springs are mounted in the porcelain base with the free ends so arranged as to bear on the outside of these copper tongues. This will be clearly understood from the illustration. Thus, without any external adjustment or any other labor than the insertion of the lamp, sufficient tension is brought to bear upon the lamp base to prevent vibration from causing the contact to break even under the most severe conditions. This lamp-grip feature can be supplied, at a slight additional charge, in connection with practically all sockets of both the medium and mogul type manufactured by the above company.

LAMP GRIP

Electric Hammers in Railway Work

In answer to the question that is frequently asked in regard to the ability of the electric hammer to do the work of the pneumatic hammer in railway work, the Western Electric Company states that the former is recommended for every kind of work, except riveting, that can be assigned to any hammer. In electric railway work especially, where there are power mains always ready to be tapped, the electric hammer looms far above its pneumatic brother. In power economy it is 80 per cent more efficient, and in flexibility the advantage is obvious. A pneumatic hammer requires a compressor with its attendant piping; an electric hammer needs no special apparatus since the power mains follow the railway.

Not only will the electric hammer do the things the pneumatic hammer is now doing, but it opens up possibilities in many fields which would not justify the installation of air equipment. It may be used in subways where the trolley hangers, guide wires, etc., must be fastened to concrete; in power houses and substations for all drilling for cable racks, railings, piping, etc.; for scaling paint from iron work on elevated and other structures; for bush hammering concrete retaining walls and stations; for roughing up store stair-

ELECTRIC HAMMER

ways; for chipping scale from condenser tubes, and for taking out foundations, ripping out doorways and the like. The electric hammer, however, cannot be used for riveting and heavy chipping.

When it is remembered that a man with a hand hammer strikes from fifty to seventy-five blows per minute and that operating a pneumatic tool requires compressor, piping and considerable power, there are obvious advantages in a tool which is absolutely self-contained because it may be connected to any lighting socket or trolley circuit and which strikes 1800 blows per minute, as is the case with the electric hammer.

Portable A.C.-D.C. Electrodynamometers

The Western Electric Instrument Company, Newark, N. J., has recently perfected a new line of instruments which mark a distinct advance in the science of electrical measurements, problems hitherto considered impossible of solution having been solved in their design. They constitute, in fact, the latest development in instruments of this type and embody characteristics never before attained.

The instruments are made in voltmeter, ammeter and wattmeter forms, all of which are adapted to measurements of precision on either a.c. or d.c. circuits. They

are guaranteed to an accuracy of 0.25 per cent full-scale value at any frequency up to 133 cycles per second and any wave form, and they can be used on circuits of any commercial frequency even as high as 500 cycles per second with only slight error.

Double ranges are provided for both current and voltage circuits and the wattmeter can be used for 100 per cent overload indefinitely without introducing error. The

PORTABLE A.C.-D.C. ELECTRO-DYNAMOMETER

movable systems of the instruments have an extremely low moment of inertia and they are very effectively damped. The indications are independent of room temperature or the heating effect of the current passing through the windings, and the instruments are shielded from external magnetic influences. The scales, which are $5\frac{1}{4}$ in. long, are uniform throughout their entire length in the wattmeters, while in the voltmeter and ammeter the upper four-fifths of the scale is especially legible and uniform, although absolute uniformity is impossible owing to the principle of operation. Each scale is hand-calibrated and is provided with a mirror over which the knife-edged pointer travels. The pointers are equipped with a simple zero-setting device. The dimensions of all of the instruments are 8 in. x $10\frac{1}{4}$ in. x $5\frac{3}{4}$ in.

In the wattmeter form instruments can be furnished for very low power factors, such as are involved in measuring core losses in transformers giving full scale deflection for 20 per cent power factor. Temperature errors are very small and can be corrected by reference to the certificates that accompany all Weston instruments. The line includes a polyphase wattmeter that

is guaranteed to an accuracy of 0.5 per cent full-scale value on a.c. circuits of any frequency up to 133 cycles per second and any wave form. Even on circuits as high as 500 cycles per second there are only very slight errors due to phase displacement.

Jack Designed to Remove Poles

Railway companies frequently have occasion to remove poles from one location to another or to take them out entirely, and to meet this demand Templeton, Kenly & Company, Ltd., Chicago, have placed on the market a jack designed especially to remove poles. In an actual test it took nineteen minutes for the jack to remove the pole shown in the accompanying illustration, this being done without digging around the pole or employing any other tool. The jack is single acting, operating on the down stroke of the lever and

SINGLE-ACTING, 15-TON POLE JACK WITH 24-IN. LIFT

tripping at any point. It has a capacity of 15 tons, a lift of 24 in. and a complete height of 39 in. It pivots on its own base, revolving from 30 deg. to 90 deg. from the vertical, and hence will follow the angle of the pole as it is pulled, a recessed cap holding securely the links of the chain which is fastened around the pole. The jack, together with a 5-ft. heavy chain with a grab hook, a steel lever bar and a section of 10-in. I-beam used for a bearing block, make up the standard equipment for completing the entire operation.

35,000-Kw., 60-Cycle Unit for Chicago

The Commonwealth Edison Company of Chicago has just purchased a new turbine unit, the generator end of which will be the largest 60-cycle machine in existence. The unit was sold by the Westinghouse Electric & Manufacturing Company and will be a tandem-compound machine of the straight Parsons type, rated at 35,300-kva. at 85 per cent power-factor. It will produce electrical power at 12,000 volts, three-phase and 60 cycles, its speed will be 1200 r.p.m. and it will operate in parallel with the Commonwealth Edison Company's 60-cycle system. The turbine will take steam at 220-lb. pressure with 200 deg. superheat and will exhaust against a 29-in. vacuum. Forced ventilation for the generator

will be supplied by an external motor-driven blower which is to be placed in the air duct leading from the air intake to the generator. The exciter will be direct-connected to the main machine and the unit complete will measure 75 ft. long by 18.5 ft. wide by 21 ft. high over all. This new unit will be installed in the company's Northwest station and, according to the terms of the contract, will be ready for operation in time to carry the peak load in the fall of 1916. In design the unit represents a radical departure from the large Westinghouse machines now operating in the Interborough station in New York in that the entire unit will be placed on one shaft instead of being divided into two cross-compounded machines. Auxiliaries for this unit have not been purchased as yet.

Double-Cushioned Non-Return Valves

The non-return or stop-and-check valve made by the Golden-Anderson Valve Specialties Company, Pittsburgh, Pa., is provided with a number of unique features, of which one of the most important is that the automatic action can be tested in service. Consequently

CUSHIONED NON-RETURN VALVE

the installation of one of the valves in the steam header of a boiler insures absolutely that the boiler will be protected in case of accidents, that the pressure between the various units of the battery will be equalized, and that there is no possibility of turning live steam into a boiler in which repair men may be working.

As shown in the accompanying cut, the valve is cushioned in both directions and is made positive in operation because of the large area that is effective for the steam pressure which acts to close the valve in case of its automatic operation. This cushioning is carried out by a double dashpot which occupies the full area of the upper portion of the body and thus positively prevents any hammering or pounding. There is only one moving part, the piston or hollow valve, and this is always kept in perfect alignment with the seat, regardless of its position. The valve is therefore practically indestructible and its low maintenance charges make it, in the end, one of the least expensive automatic devices provided for the protection of life and property in connection with the use of steam.

The operation of the valve is simple. When the steam pressure raises the hollow valve there exists a space between the top of the hollow valve and the disk that is integral with the stem, and this space is promptly filled with steam which leaks past the disk. The area above the hollow valve is also filled with steam so that the valve is perfectly cushioned both in opening and in closing. The feature of automatic testing in service consists in permitting an exhaust of steam from the cushioning chambers by opening a small hand valve that may be located at any convenient point. The non-return valve will then automatically close, but by closing the exhaust the non-return valve moves back to the open

position ready for automatic action. The makers absolutely guarantee these valves not to chatter, hammer or stick and warrant them to be the most positive, durable and economical automatic valves on the market. All of the valves are made double extra heavy regardless of the service for which they are to be used.

Rating Concrete Mixers

Up to the present time there has never been any standard method of rating batch mixers for concrete. Some mixer manufacturers rate their machines by their capacity in mixed concrete while other manufacturers rate them by their capacity in loose, unmixed materials. It is a well-known fact that a mixer having a batch capacity of, say, 9 cu. ft. of unmixed sand, stone and cement will hold only about 6 cu. ft. of mixed concrete per batch. For this reason the capacities 3 ft., 4 ft. or 9 ft. when applied to concrete mixers have never had any definite significance.

However, the National Association of Mixer Manufacturers at its August meeting took steps toward remedying this difficulty by adopting a resolution providing for the uniform rating of batch mixers. This resolution provides that, in future, catalogs and circulars shall specify the capacity of each mixer as the size of wet-mixed batch and not otherwise. The resolution further provides that the dry, unmixed capacity of a mixer may be approximately as one and one-half times the size of the wet-mixed batch, assuming the use of cement, sand and 1½-in. crushed stone with 1¾ gal. of water per cubic foot of mixed concrete. The members of the association further agreed not to use the dry-batch rating in their correspondence, advertising, etc., unless the standard wet-batch rating was used also and with equal prominence.

The association feels that the step is a very desirable one, and one that will prove beneficial to all contractors, mixer manufacturers and, in fact, every one connected with the concrete and cement industries. A contractor can now arrive at a real comparison between mixers, not only in price but in capacity, a problem that would be exceedingly difficult without a standard rate to serve as a basis.

Standard Screw Threads for Electric Sockets

A statement recently issued by the American Society of Mechanical Engineers covers a report from its committee on standardization of special threads for fixtures and fittings, which submits standards for rolled threads for screw shells of electric socket and lamp bases. Dimensions for four different sizes are given, these approximating ¾-in., ½-in., 1-in. and 1½-in. diameters of thread. The standard is expressed in the form of dimensions for maximum and minimum gages, the difference of diameter between these being 0.006 in., 0.006 in., 0.008 in. and 0.012 in. for the four sizes respectively. The number of threads specified are respectively fourteen, ten, seven and four per inch, while the depths of thread are 0.02 in., 0.025 in., 0.033 in. and 0.05 in.

Albert H. Hale, a motorman of the Cairo Electric and Traction Company, Cairo, Ill., has been given a patent for a new brake which is constructed in such a manner that the momentum of the car serves to give the power necessary to tighten the brake. Thus, the operator has merely to exert a slight pressure of his hand upon a bar which slides through a ratchet in order to bring the car to a sudden stop. The brake was first tried about three years ago and is now in active service on one of the Cairo cars.

News of Electric Railways

WILKES-BARRE WAGE AWARD REPUDIATED

**Representative of Men on Wilkes-Barre Wage Board and
Umpire Concede Employees' Contention That Contract
Should Be Limited to Flat Scale Basis**

Thomas D. Shea, representing the men on the board of arbitration selected to settle the controversy over wages between the Wilkes-Barre (Pa.) Railway and its employees, and Dr. John Price Jackson, State Commissioner of Labor of Pennsylvania and umpire in the arbitration, have handed down a final decision that the contention of the men is correct and that the award made by the board on July 10, 1915, complied with on the part of the company, is not binding. In so doing they recommend that a flat scale of wages of approximately 27 cents an hour should be paid, and state that further negotiations for the fixing of a wage scale must be between representatives of the men and officials of the company. In brief, the situation, in some respects, is practically the same as it was on Jan. 9 last, when the agreement for arbitration was signed by the men and by the company. The official statement of the two arbitrators, dated Oct. 11, follows in part:

"The board of arbitration received a protest on the part of the Amalgamated Association, Division No. 164, on Oct. 5, claiming that the award of the arbitrators was not in accordance with the submission by the two parties, and that when they signed the submission to the arbitrators they had in mind only a flat scale of wages and not a sliding scale with a profit-sharing arrangement, such as was contained in the award.

"The board having given the railway an opportunity to submit evidence bearing upon this protest, and having received a reply, has decided that the contention of the Amalgamated Association is correct, and that the award is not co-extensive with the submission, and, therefore, is not binding. This decision is based largely upon the facts that the contract under which the board was created could readily have been construed as being limited to a flat rate of wages by those having that rate of wages in mind, and because the preliminary negotiations between the company and the employees were based solely upon a flat rate.

"The company and the arbitrator appointed thereby have withdrawn from the case, and as a result the remaining two arbitrators do not care to continue further. The situation, therefore, is now the same as was the case before the agreement for the appointment of the arbitration board was entered into, and the parties at interest are free to enter into negotiations toward a settlement of their differences. The board rules that the association did not accept the terms of the award by reason of the employees having received pay under its terms.

"Though the board does not care to continue its work by modifying the award to meet the conditions that it now deems necessary to make it co-extensive with the submission, it, nevertheless, deems it proper to state that in its judgment a flat rate equivalent to the present sliding scale, plus the amounts it believed would be available through the profit-sharing arrangement, could conservatively be estimated at between 26½ cents and 27 cents an hour. It further deems it proper to advise that in its judgment it would be well for the two parties to delay, reasonably, further negotiations in order that more data may be obtained on the possibilities of the profit-sharing plan."

T. A. Wright, general manager of the company, said that the decision of Dr. Jackson and Attorney Shea did not alter the view of officials of his company with reference to arbitration as expressed by him several weeks ago. He said that "the findings of the board of arbitration as made public several months ago, are final, binding and without appeal." He repeated that the board, after making its award, was automatically disbanded and had no legal right to reconvene or to receive further evidence. Asked whether officials of the company would grant a hearing to the men, Mr. Wright said: "I will always give an audience to a committee of our men. That is as far as I will go at this time."

The representatives of the men concluded their protest against the award of the arbitrators as follows:

"We repeat that your commission was organized to state definitely what the wages of these men should be over and above the present wages paid, and your conclusion in basing the future wages of these men on an increase car-hour earning power, or, in other words, what is commonly known as the 'profit-sharing plan,' is wrong and not within the terms of submission to arbitration."

Commenting editorially on the board's reversal of itself, the Wilkes-Barre *Evening News* of Oct. 12 said in part:

"Dr. John Price Jackson, who served as umpire on the board of arbitrators, has proved himself to be utterly unfitted to hold the responsible position of Commissioner of the State Department of Labor. He has fallen down on his first big job. In the dispute the deliberations of the board were long and thorough. The arbitrators were named in April and their decision was not handed down until early in July. Both sides submitted their briefs in full, and there was a wealth of material bearing upon every phase of the controversy to permit the arbitrators to arrive at a definite decision without resorting to snap judgments. Dr. Jackson had more than ample time to come to a conclusion as to his personal decision, and his recent stand shows his failure to do so.

"Dr. Jackson, through his wavering, fickle and altogether spineless attitude, has established a most dangerous precedent for future labor disputes throughout the State. Apparently, any agreement that does not meet with the approval of either of the contestants in a wage or other economic or industrial dispute, can be appealed from, or perhaps summarily set aside. This, obviously, defeats the very fundamental principles of arbitration as the ideal solution for labor controversies. In view of his palpable failure, Dr. Jackson would do well to resign from the office to which he has been appointed, and thereby make it possible to conserve the value of such an important department, if its functions are properly exercised."

POSTPONEMENT OF THE CONFERENCE ON THE NATIONAL ELECTRICAL SAFETY CODE

The Bureau of Standards announces the postponement of the conference that was to meet at Washington on Oct. 27 and 28, 1915, until a date to be announced later. This sudden change of plans is due to the urgent request of the National Electric Light Association, the American Institute of Electrical Engineers, and the Association of Edison Illuminating Companies that additional time be granted for the consideration of the code of rules that has been formulated by the bureau before they are submitted to a formal conference.

The Bureau of Standards has proposed that the rules be accepted tentatively for a trial period of one year before they are adopted formally by commissions or municipal authorities, and that the joint advisory committee to be established by the Washington conference should take up with the bureau the work of further revision and development of the rules if it was not found by the conference that the code as presented by the bureau or as modified by the conference was satisfactory for preliminary use. It was felt, however, by many members of the associations previously mentioned that more time should be taken and the rules very carefully studied by many who have not done so as yet, and further modified if necessary, so as to make them as generally satisfactory as possible before they are submitted for the consideration of so large and representative a body as the Washington conference would be.

Although the bureau postponed the conference last June for nearly four months it feels that the electrical companies that are most affected by the proposed code should have the fullest opportunity to study it and submit to the bureau any further information and experience bearing on its revision and development which they may think desirable.

COUNCIL PASSES DES MOINES GRANT

The City Council of Des Moines, Iowa, has passed the new franchise ordinance drawn up by a committee of the Des Moines Chamber of Commerce. Mayor Hanna and Councilman Myerly, who fought the draft to the last moment, cast their votes for it on the final ballot. They were cheered by a large audience of citizens when the vote was made unanimous for the franchise.

The franchise will be submitted to a vote of the people at a special election on Nov. 20, and following its approval it will go into effect on Jan. 1, 1916. A feature of the franchise providing for a city supervisor of the street railway system, who will work in conjunction with company officials, will be an innovation in Des Moines. The position will pay from \$3,000 to \$5,000 a year. Mayor Hanna says the supervisor must be a man with complete knowledge of street railway affairs and that a man from outside the city, who has had experience along this line, may be chosen.

SEATTLE COMPANY OFFERS TO ADVANCE APPRAISAL MONEY

In order that the controversy between the Puget Sound Traction, Light & Power Company, Seattle, Wash., and the city of Seattle, on certain franchise obligations may be terminated soon by a hearing before the Public Service Commission, officials of the company have offered to appropriate for the use of the Public Service Commission an amount not to exceed \$10,000 for the completion by the commission of the valuation of the company's property at an early date.

The principal matters in controversy between the city and company are the paving between tracks and payment to the city of 2 per cent of the gross earnings annually. The company, because of its petition on these and other franchise questions before the State Commission, has refused to pave between its tracks in five recent improvements. Mayor Gill threatened to recommend the revocation of franchises unless the company complied with the franchise agreement, which is alleged to have required the company to pave between tracks. Later it was tentatively agreed to begin a mandamus suit to compel compliance. In commenting on the franchise requirements with respect to paving and payment of a percentage of the gross receipts to the city the company's statement says:

"The company cannot comply with those provisions of the franchise and at the same time have additional burdens placed upon it by the Public Service Commission, some of which burdens the city has endeavored to have the commission place upon the company.

"The company lost more than \$60,000 by reason of the city's action in illegally compelling the company to sell tickets upon its cars. The position of the company in regard to the sale of tickets was sustained by the courts, but the city made no compensation for the loss which the company sustained during the litigation and prior to the decision. The company also has sustained heavy losses from the operation of the jitney.

"The position of the company is that if it is required to maintain the standard of service ordered by the commission, which is more burdensome than that stipulated by the franchises, the company must be relieved from some of the provisions of the franchises. The question whether the public service commission law has not already eliminated these burdensome provisions and whether, if not, the commission should not relieve the company of these provisions, is one which should be settled in an orderly manner. The decision of the courts is necessary to such settlement. A valuation of the property by the commission is also probably necessary for such settlement. The company proposes to the city to unite with it in bringing about a speedy determination of the questions involved."

The company agrees to keep the unpaved space in paved districts in a safe condition by planking until the controversy is settled, and if the time comes for paying its 2 per cent of earnings before the courts have decided the question it will make payment under protest and, in the event of the court rendering a decision favorable to the company, ask a refund of the money thus paid.

CONSUL REAT ON THE EDMONTON MUNICIPAL RAILWAY

United States Consul Samuel C. Reat at Calgary, Alberta, Canada, has written on "Municipal Ownership in Edmonton" in *Commerce Reports*. In discussing the street railway department, Mr. Reat said:

"On Nov. 8, 1908, Edmonton instituted the street railway system, the largest venture in the municipal ownership program and at present the gravest problem. It seems impossible for this utility to be operated without incurring a big deficit each year. Edmonton has the difficulty to contend with of a large area and a relatively small population. The population of Edmonton is about 40,000, scattered over an area of some 27,000 acres. The establishment of a jitney service has affected somewhat the street railway earnings, but as this service was not established until the spring of 1915 its competition need not be taken into account in this review.

"The trackage of the Edmonton street railway system consists of 43 miles of double track (figured on a single-track basis) and 11 miles of single track. The utility had 258 employees and paid \$284,159 in salaries during 1914. Its debenture liability as of Dec. 31 was \$3,004,429. The cost of the system to that date totaled \$3,063,784, the buildings, track and equipment having cost \$2,887,866, discount on debentures \$115,876, Strathcona franchise \$10,000, and land \$50,942. The sinking fund amounted to \$174,691. The year's expenditures were: operating, \$535,430; maintenance, \$80,282; other, \$251,958; a total of \$867,670; against which were receipts aggregating \$642,109, leaving a deficit for the year of \$225,561.

"In 1914 the Edmonton street railway had one fatal accident and ten suits for damages, all of which were successful, the department paying \$11,182 in damages."

NEW CLEVELAND BRIDGE PROPOSAL

The Cleveland (Ohio) Underground Rapid Transit Company agreed on Oct. 4 to enter no objections to the proposed subway approaches from both east and west to the new bridge across the Cuyahoga River at the foot of Superior Avenue, provided it is allowed to use the bridge upon the same basis as the Cleveland Railway. The company, however, indicated its intention to contest any rental charge, if the Cleveland Railway is allowed to use the bridge free, as has been suggested by Peter Witt, street railway commissioner. An ordinance will be drafted soon to cover this agreement between the company on the one side and the city and county on the other.

In an interview recently C. E. Ruthenberg, socialist candidate for Mayor of Cleveland and author of the ordinance providing for the purchase of the Cleveland Railway by the city, explained his plan of taking over the property. He believes that it would be possible to sell an issue of \$34,000,000 of bonds with the railway property as security and have many of the stockholders accept bonds for their holdings. He said that the interest rate on bonds should not be more than 4½ or 5 per cent. Nothing, however, has been said by Mr. Ruthenberg as to the possible basis of exchange of bonds for the stock.

A. J. Campbell, chief engineer of the Foundation Company of New York, said that such subway disasters as occurred in New York recently are very unlikely in the construction of the subway to be built under East Fifty-fifth Street, Cleveland, Ohio, by the Cleveland, Akron & Canton Terminal Railroad, in case the franchise is approved at the November election.

County and city officials and the Cleveland Rapid Transit Railway are still working on plans for the subway approaches to the new Superior Avenue bridge. The main arch of the bridge was lowered into place last week, and it is probable that the construction work will now be hurried along as rapidly as possible. The completion of the bridge will make it possible for the Cleveland Railway to furnish much better service to the West Side.

The street railway approach to the proposed new union passenger station will be through a subway from Lakeside Avenue, according to the latest plan announced. The new station is to be made a part of the group plan, in connection

with the new City Hall, the Courthouse and the Federal Building, which have already been completed.

The Cleveland Railway was granted a franchise on Oct. 11 to construct a single track on East Seventy-third Street from Denison Avenue to the city limits.

FULL SCHEDULES IN FORT WAYNE

Operation of cars in Fort Wayne, Ind., continues under full schedules. There has been no serious disorder and a gradual increase in the number of people riding. The Federation of Labor has assessed all members of the unions at Fort Wayne to raise \$1,500 a week for the striking car men. Every effort is being made to divert travel to the jitneys, and a stock company is proposed by the labor people to operate a line of large buses with a capacity of twenty-five passengers each in competition with the street railway. The chief of police has issued orders for the immediate arrest of any persons shouting at operating cars or seeking to incite violence against them. The City Council has decided, on the advice of the City Attorney, that it was not good policy to pass over the Mayor's veto the ordinance requiring extended experience in operating cars in Fort Wayne. The new men now operating cars have already had the necessary experience provided for in the ordinance, so that present operation by the company in Fort Wayne would not be affected. Mayor Hosey and a committee from Fort Wayne called on Governor Ralston at Indianapolis and requested the appointment of a committee to investigate the strike. The Governor stated that the matters in dispute in Fort Wayne, where a contract had been signed by the company and the employees covering working conditions, should be decided by the courts. In view of Judge Anderson's hearing to be held on the injunction proceedings, Governor Ralston would take no action.

Work on Cleveland Underground Line to Begin by Jan. 1.—W. R. Hopkins, president of the Cleveland Rapid Transit Railway, told the city officials and county commissioners at Cleveland recently that the company will begin work on building its subway before Jan. 1, 1916. This statement was made before the Council in a discussion of plans for subway approaches to the new Superior Avenue bridge across the Cuyahoga River.

New Haven Conspiracy Trial Begun.—William Rockefeller, Lewis Cass Ledyard, Edward D. Robbins and eight other past or present directors of the New York, New Haven & Hartford Railroad appeared on Oct. 13 in the Federal District Court at New York to stand trial before Judge Hunt and a jury on a charge of having conspired to violate the Sherman law by seeking to monopolize all the transportation facilities of New England. The work of selecting jurors was begun at once and three provisional talesmen were agreed upon the first day. It was expected that several days would be consumed in securing a panel of jurors considered to be qualified to pass upon the evidence in the case.

Question of Union Jurisdiction.—W. D. Mahon, president of the Amalgamated Association of Street & Electric Railway Employees of America, was authorized at the recent convention of the association in Rochester, N. Y., to name a committee to confer with a similar committee from the Order of Railway Conductors and the Brotherhood of Locomotive Engineers on the subject of jurisdiction where joint operating agreements exist between companies with labor agreements with both associations. Up to Oct. 1 Mr. Mahon had not announced the members of the amalgamated committee. One of the cases awaiting adjudication is that of the Hudson Valley Railway and the United Traction Company, Albany, N. Y.

Brighton Beach Reconstruction Contract Approved.—The form of contract and plans for the reconstruction of the Brighton Beach rapid transit line in Brooklyn, submitted by the New York Municipal Railway Corporation, has been approved by the Public Service Commission for the First District. This contract involved the reconstruction of the line from Church Avenue northward to Malbone Street and the widening of this portion from two to four tracks and the reconstruction of three stations, namely, the Church Avenue, Woodruff Avenue and Prospect Park stations. This work, it is estimated, will cost from \$750,000 to \$1,000,000. When it is finished it will make the Brighton

Beach line four tracks from Sheepshead Bay to Prospect Park station, a distance of about 4 miles. From Sheepshead Bay southward the line is to be elevated into Coney Island and four-tracked. This line is to be connected by a new two-track subway branch through Flatbush Avenue at Malbone Street with the Fourth Avenue subway near the Long Island Railroad terminal at Atlantic and Flatbush Avenues, Brooklyn.

Colorado Commissioner on Weakness of Municipal Ownership.—S. S. Kendall, chairman of the Colorado Utilities Commission, in a recent address, said: "It is a notorious fact that very few cities and towns have the slightest conception as to what it costs them to build, operate and maintain a plant; possibly in some instances they do not care, but as a plain business proposition they should know whether a plant is self-sustaining, or whether it is maintained partially from general revenues. Under a proper system of accounting they will be compelled to segregate all items of income and disbursements which properly belong to a plant from other departments, and will be required to set aside annually from their revenues a depreciation reserve fund to cover depreciation cost. While this is done in most cases of privately-owned plants, it is seldom done in the case of municipally-owned plants. It is only natural that city officials want to make as good a showing as possible and are only too willing to allow their successors to assume the burden of renewals to the property. The result is that in a few years not much value is left to the plant except as junk."

A. G. Snell Bats 600.—The employees of the various departments of the Rockford & Interurban Railway, Rockford, Ill., entered a team in the City Commercial Baseball League, a six-team organization. The season opened on May 1, and games were played every Saturday thereafter until Aug. 14, making a fifteen-game season. The company furnished the uniforms for the team. Fellow employees were very loyal rooters. Out of the fifteen games played, the team won eleven, a percentage of .733, giving it the championship of the league. One game of eleven innings was the only extra inning contest of the season. It was won by the traction champions. Most of the games were closely contested and the championship was not decided until the last game on Aug. 14, when the railway team defeated the team of employees from the Clark Manufacturing Company. Stewart Ralston, chief clerk to the electrical engineer of the Rockford & Interurban Railway, was the manager of the team. He played the position of catcher. Practically all of the games were won by the heavy hitting ability of the team. A. G. Snell, superintendent of transportation, played at second base. He led the team with a batting average of 600, getting twenty-seven hits on forty-five trips to the plate, six of which were for two bases and two for three bases.

PROGRAMS OF ASSOCIATION MEETINGS

Kansas Gas, Water, Electric Light & Street Railway Association

The Kansas Gas, Water, Electric Light & Street Railway Association will meet in Topeka, Kan., on Oct. 21, 22 and 23.

Association of Railway Electrical Engineers

The eighth annual convention of the Association of Railway Electrical Engineers will be held at the Hotel La Salle, Chicago, Ill., on Oct. 18, 19, 20, 21 and 22, 1915. Following the address of President H. C. Meloy, who is connected with the New York Central Lines, standing committee reports will be presented on "Reciprocal Relations," "Loose-Leaf Binders for Filing Specifications and to Keep Specifications and Standards to Date," "Data and Information," "Specifications for Wiring Crossings for Potentials Above 100 Volts," "Standards for Train-Lighting Equipment," "Electric Headlights," "Wireless Telephone and Telegraph as Applied to Moving Trains," "Industrial Trucks," "Wire Specifications," "Metal Conduit Specifications," "Standard Rules for Car Wiring," "Rating of Train-Lighting Lamps," "Illumination," "Standardization of Cranes," "Turntable and Transfer-Table Motors" and Compressed-Air Generation" and "Shop Practice."

Financial and Corporate

ANNUAL REPORT

Cumberland County Power & Light Company

The combined comparative statement of income, profit and loss of the Cumberland County Power & Light Company, Portland, Me., and its subsidiaries (intercompany items eliminated) for the fiscal years ended June 30, 1914 and 1915, follows:

	1915	1914
Gross earnings	\$2,551,263	\$2,447,406
Operating expense	\$1,331,992	\$1,303,797
Taxes	112,750	106,158
Total	\$1,444,742	\$1,409,955
Net earnings	\$1,106,521	\$1,037,451
Interest, etc.	\$777,210	\$753,305
Preferred stock dividend	138,000	138,000
Total	\$915,210	\$891,305
Balance	\$191,311	\$146,146

The comparative statements of the two electric railway subsidiaries, the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway for the same periods follow:

	Portland R. R. [†]		Lewiston, Augusta & Waterville St. Ry. [†]	
	1915	1914	1915	1914
Gross earnings	\$1,043,735	\$1,046,674	\$703,897	\$677,723
Operating expenses and taxes	647,596	642,867	459,876	458,174
Net earnings	\$396,139	\$403,807	\$244,021	\$219,549
Interest charges	\$261,730	\$247,561	\$187,543	\$184,834
Dividends	99,950	99,950	36,000	36,000
Balance-surplus	\$34,459	\$56,296	\$20,478	*\$1,285

*Deficit.

†Intercompany items are included, and the figures show the results, as if the companies had been operated separately.

The Portland Railroad, leased, showed a decrease of \$2,939 in gross earnings during the fiscal year ended June 30, 1915, owing to the inclement weather in July and August, 1914, and to the competition of jitneys (regulated since Sept. 4, 1915, by ordinance) and other automobiles in Portland. Moreover, the operating expenses included \$32,000 to cover depreciation on the car equipment, an item not included in previous years. Interest, etc., increased \$14,169, this being caused by charging to operating expenses the actual manufacturing cost of additional power purchased from the Cumberland County Power & Light Company and charging the balance to interest, etc.

The Lewiston, Augusta & Waterville Street Railway (controlled through stock ownership) had an increase of \$26,174 in gross earnings during the year, attributable to the mild weather conditions during the winter of 1914-1915, to the fact that the Legislature was in session in Augusta and to a satisfactory increase in the freight and express business. The operating expenses included a new item of \$16,000 for estimated depreciation of car equipment. The interest charges increased \$2,709 on account of interest and discount on additional notes outstanding and an increase in unfunded debt.

FARES COLLECTED ON BROOKLYN ELEVATED

The Public Service Commission for the First District of New York has issued a statement showing the fares collected at stations of the New York Consolidated Railroad and connecting lines of the elevated system of the Brooklyn Rapid Transit Company for the year ended June 30, 1915.

As compared with 1914, the statement shows a material falling-off in fares collected at practically every station on the various lines. At Brooklyn Bridge, for instance, the total fares collected in 1915 were 30,791,711, a decrease of 2,279,593 under the previous year; at the Park Row station 29,205,995, a decrease of 2,259,666; on the Fulton Street city line 25,278,312, a decrease of 1,305,608; on the Lexington Avenue-Cypress Hills lines 19,689,324, a decrease of 798,179; on the Myrtle Avenue-Ridgewood line 12,189,-

942, a decrease of 392,601; on the Broadway line 9,235,328, a decrease of 89,738.

The Brighton Beach-Franklin Avenue line, while showing a decrease, did not suffer so severely as most of the other lines. The total fares taken in by this line were 12,104,540, a decrease of 160,544 as compared with 1914. The Fifth Avenue-Bay Ridge line showed a decrease of 407,807, its total fares collected in 1915 being 17,707,609. Coney Island Terminals showed a decrease of 474,437, the total fares being 10,647,697; Williamsburg Bridge collected 6,376,304 fares, a decrease of 1,509,263. The grand total on all of the lines amounted to 167,400,086 fares, a decrease of 3,471,194.

THIRD AVENUE BONDS AUTHORIZED

Public Service Commission Authorizes Company to Issue \$2,020,487 of Bonds—Might Mean Beginning of Dividends

The Public Service Commission for the First District of New York on Oct. 8 authorized the Third Avenue Railway, New York, to issue \$2,020,487 of first refunding mortgage fifty-year 4 per cent gold bonds. The bonds are dated Jan. 1, 1910. The sum of \$4,000,000 had already been issued under an application for \$6,650,000 made on Dec. 24, 1913. The amount authorized now has not been in dispute, but the remainder of the \$2,650,000 covered by the original application is yet held up. A statement by the company in regard to the general delay was published in the ELECTRIC RAILWAY JOURNAL of Oct. 2.

The items for which payment is provided out of the proceeds of the bond issue just sanctioned, include the following: Balance owing for fifty low-step cars, \$93,033; capital stock of the Pelham Park & City Island Railroad at par, \$25,000; to reimburse the treasury for expenditure in purchasing bonds, stock and claims against the New York City Interborough Railway over and above \$1,000,000 allowed by the order of Feb. 20, 1914, \$421,996; to reimburse the treasury for expenditures out of income, including the following: 450 shares of stock of the Pelham Park & City Island Railroad, \$40,000; \$20,000 of capital stock of the Third Avenue Bridge Company, \$20,000; demand notes of the same company, dated July 1, 1914, \$96,908; property and additions on Third Avenue Railway lines, Jan. 1, 1912, to Feb. 1, 1915, \$431,919; to reimburse the treasury for expenditures during the same period for additions upon the controlled lines of the Third Avenue Railway companies over and above those upon the Third Avenue Railway proper, as just indicated, \$451,022; to cover expenses of sale and to make up discounts, \$444,507.

The bonds are to be sold at not less than 78 per cent, and provision is to be made for the amortization of any discount on sale. The \$4,000,000 of bonds first authorized was to be issued at not less than 82, with amortization also provided for.

In some circles this bond authorization has been accepted as indicating an early payment of dividends on the stock of the company. The expenditures for improvements and betterments have been heavy for some time, and in the absence of authorization to issue and sell bonds, requirements for such purposes have been met from current income. It has been contended that many of these outlays were properly chargeable to capital and not current income, and one group in the board of directors is now expected to insist that certain of these improvements be capitalized, in which case there will be left available money for the payment of dividends.

American Light & Traction Company, New York, N. Y.—The American Light & Traction Company has declared a cash dividend of 2½ per cent on the common stock and a stock dividend at the rate of 2½ shares of common stock on every 100 shares of common stock outstanding. There has also been declared a dividend of 1½ per cent on the preferred stock, all payable on Nov. 1 to stockholders of record on Oct. 15. A. P. Lathrop, president of the company, who recently returned from a month's trip to cities in which the operating companies are located, was surprised by the improvement in general business since his last inspection trip. Detroit is showing a wonderful expansion industrially, but

there also has been a great improvement in St. Paul, Milwaukee and other Western cities. According to Mr. Lathrop, the improvement appears to be based on a firm foundation and not at all of a temporary nature. The earnings of the operating companies are feeling the full effect of these better conditions and good gains are being made over last year.

Brooklyn (N. Y.) Rapid Transit Company.—The Central Trust Company, Kuhn, Loeb & Company and Kidder, Peabody & Company, New York, who privately opened subscriptions for their purchase of the new issue of \$20,000,000 of Brooklyn Rapid Transit 5 per cent secured notes, noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, announce that the entire amount has already been over-subscribed. Only members of the old syndicate which underwrote the original \$40,000,000 of the issue were given an opportunity to subscribe, and the subscription price was 100 less $\frac{1}{2}$.

Fairmount Park Transportation Company, Philadelphia, Pa.—E. W. Clark & Company, Philadelphia, announced on Oct. 1 that they were buying coupons on the \$750,000 of first mortgage 5 per cent bonds of the Fairmount Park Transportation Company, due that day. The sale of this property subject to the bond issue was noted in the *ELECTRIC RAILWAY JOURNAL* of June 26.

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa.—N. W. Halsey & Company, New York, are offering \$5,500,000 of first mortgage 5 per cent bonds of the Fort Dodge, Des Moines & Southern Railroad to yield 5.5 per cent for the eighteen later maturities and 4.5, 4.75, 5, 5.25 and 5.4 for the installments maturing in the years 1916 to 1920, inclusive. These bonds are dated Dec. 1, 1913, and are due serially on Dec. 1, \$50,000 yearly 1916 to 1937, both inclusive, and \$4,400,000 in 1938, but redeemable all or in part on any interest date at 105 and interest. They are secured by a first lien on 128.75 miles of electrified railroad, extending from Des Moines to Boone, Ames, Rockwell City and Fort Dodge and carrying on both passenger and freight business. The entire outstanding bonded debt of \$5,500,000 is said to represent 62 per cent of the replacement value of the physical property.

Hudson & Manhattan Railroad, New York, N. Y.—The Board of Public Utility Commissioners of New Jersey has approved the application of the Hudson & Manhattan Railroad to issue \$615,500 of 5 per cent first lien and refunding mortgage bonds to the Central Trust Company, New York, as trustee. The bonds must net the company not less than 80 per cent of par. The authorization of this issue by the Public Service Commission for the First District of New York, with the purposes of the issue, was noted in the *ELECTRIC RAILWAY JOURNAL* of Sept. 18.

Kansas City Railway & Light Company, Kansas City, Mo.—Kuhn, Loeb & Company, Lee, Higginson & Company and Blair & Company, reorganization managers for the Kansas City Railway & Light Company, have announced that Judge Hook has extended the time for the deposit of Kansas City Elevated Railway general mortgage 6 per cent bonds and general mortgage 4 per cent bonds and Kansas City & Westport Belt Railway first mortgage 5 per cent bonds to Nov. 10. Judge Hook has reserved decision as to whether further deposits of bonds and notes embraced in the reorganization plan other than those above mentioned shall be accepted.

Long Island Railroad, New York, N. Y.—The President of the Borough of Queens has approved the report of C. B. Moore, consulting engineer, in favor of leasing the tracks of the Long Island Railroad for operation of rapid transit trains from Corona to Whitestone and Little Neck. The report shows that the cost of constructing a city built line to Whitestone and Little Neck would be approximately \$6,000,000, on which the interest would be \$300,000 a year as compared to an initial rental of the railroad tracks for \$125,000 a year, with an annual increase of 6 per cent. In regard to the rental figure, the report states that the payment should be based upon the present net earnings of the company derived from the portion of its lines over which it is proposed to lease traffic rights, considering traffic on the Port Washington branch diverted to the rapid transit service and the future development of the territory. A ratio equal to the present net income of the company, increasing in such ratio as the average increase for the last five years, is deemed to offer a fair return for the rights to be leased.

Mansfield Public Utility & Service Company, Mansfield, Ohio.—The preferred stockholders of the Mansfield Railway, Light & Power Company, who in 1912 brought suit for dissolution against the common stockholders and secured on Dec. 28 an order of sale, have formed the Mansfield Public Service & Utility Company with \$3,500 of capital stock (par \$1), as compared to the former company's capital stock issue of \$1,000,000. At the sale the Mansfield Public Service & Utility Company bought the assets for \$10,000, subject to a \$942,000 mortgage lien. The assets of the old company were appraised at \$1,430,000. The court has confirmed the sale, and the transfer of the property is expected soon to take place. The officers of the new company are: President, F. Hertenstein, Cincinnati; vice-president, Reid Carpenter, and secretary, S. A. Foltz, both of Mansfield.

North Branch Transit Company, Bloomsburg, Pa.—It is reported that the Columbia County Court on Sept. 28 appointed A. W. Dusy as receiver of the North Branch Transit Company, which owns and operates 30 miles of electric railway connecting Berwick, Bloomsburg, Catawissa and Danville. The company took over the Columbia & Montour Electric Railway and the Danville & Bloomsburg Street Railway several years ago.

Northern Electric Railway, Chico, Cal.—The reorganization committee of the Northern Electric Railway and its subsidiary and allied corporations has addressed a communication to the creditors of all the corporations, announcing that the plan has been agreed upon and setting forth the procedure necessary to make the plan effective. The time for owners or pledgees of bonds and creditors to become parties to the agreement is now limited to Nov. 15.

Ocean Shore Railroad, San Francisco, Cal.—It is reported that an assessment of \$3 per share has been levied on the stock of the Ocean Shore Railroad. A previous assessment was announced in the *ELECTRIC RAILWAY JOURNAL* of April 24, 1915.

Philadelphia & Western Railway, Upper Darby, Pa.—The revenues of the Philadelphia & Western Railway for the fiscal year ended June 30, 1915, were \$422,806, an increase of \$50,949 over the preceding year. Of this \$401,672 (an increase of \$51,141) came from passenger traffic and \$1,003 (a decrease of \$593) from freight traffic, with other small items included in the total revenues. Operating expenses totaled \$210,040, an increase of \$1,663, leaving net operating income of \$212,766, an increase of \$49,286. The operating expenses were made up as follows: Maintenance of way and structures, \$47,785 (\$5,865 increase); maintenance of equipment, \$33,490 (\$9,428 decrease); traffic, \$2,989 (\$534 increase); power plant, \$49,415 (\$563 decrease); conducting transportation, \$60,600 (\$3,068 increase), and general, \$15,759 (\$2,186 increase). The operating ratio for the year was 49.68 per cent, a decrease of 6.36 per cent. The deductions from income decreased by \$765 to \$147,339, leaving \$65,426 to be transferred to profit and loss. During the year the company carried 2,931,693 passengers, an increase of 306,476. The receipts per passenger amounted to 13.7 cents, an increase of 0.3 cent, and the earnings per passenger car-mile 31.4 cents, an increase of 2.8 cents. The expenses per revenue car-mile were 16.2 cents, a decrease of 0.5 cent. The steam railways with which the company competes increased their passenger fare rates in December, 1914, and this favorably affected electric railway passenger revenues, including the receipts from traffic interchanged with the Lehigh Valley Transit Company. In June, 1915, the company paid off \$480,000 of floating debt by the sale of first mortgage 5 per cent bonds, due in 1960.

Quebec Railway, Light, Heat & Power Company, Quebec, Que.—The board of directors of the Quebec Railway, Light, Heat & Power Company, which at the last annual meeting was reduced from nine members to six, was recently increased to eleven members. The new directors are Arthur Berthiaume, Treffe Bastien, Louis J. Tarte, Arthur Ecremont and L. G. Morin.

St. Cloud (Minn.) Public Service Company.—The Chicago Savings Bank & Trust Company, Chicago, is offering for sale at 100 and interest, to yield 6 per cent, a block of first mortgage gold bonds of the St. Cloud Public Service Company, dated 1914 and due in 1934. These bonds are subject to redemption on any interest date at 105 and interest on or before Nov. 1, 1920; at 104 and interest on or before Nov. 1,

1925, and at 103 and interest thereafter. The bonds are secured by an absolute first mortgage on the gas, electric light and street railway properties in St. Cloud, and by the electric light and power properties in Sauk Rapids, Rockville, Cold Springs, Richmond, St. Joseph and Waite Park.

San Diego (Cal.) Electric Railway.—The California Railroad Commission on Sept. 28 issued an order extending the time until Oct. 1, 1916, in which the San Diego Electric Railway may issue bonds amounting to \$4,748,000 heretofore authorized. The application for this order was mentioned in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9.

San Francisco, Napa & Calistoga Railway, Napa, Cal.—The Mercantile Trust Company, San Francisco, has invited bids for the sale to it on Nov. 5 of a sufficient amount of San Francisco, Napa & Calistoga Railway first mortgage 6 per cent gold bonds for the investment of \$6,764 now in the sinking fund. The bids must not exceed 105 and accrued interest and must be in by Oct. 26.

Scranton & Wilkes-Barre Traction Corporation, Scranton, Pa.—Lamarche & Coady, New York, are offering at par (with a 50 per cent bonus of common stock) a block of 6-7 per cent cumulative preferred stock of the Scranton & Wilkes-Barre Traction Corporation. The dividends on this issue are at the rate of 6 per cent up to 1917, and 7 per cent thereafter. This company owns all the bonds and stock, except directors' shares, of the Lackawanna & Wyoming Valley Railroad, the interurban electric railway between Scranton and Wilkes-Barre.

Second Avenue Railroad, New York, N. Y.—The receiver of the Second Avenue Railroad recently announced that holders of receivers' certificates would receive payment of interest for the six months ended Sept. 30, 1915, at the rate of 6 per cent per annum, upon presenting their certificates for appropriate indorsement at the Guaranty Trust Company, New York, on or after Oct. 1.

Taunton & Pawtucket Street Railway, Taunton, Mass.—The Supreme Judicial Court of Massachusetts on Oct. 7 affirmed a decree of the Superior Court authorizing the Federal Trust Company to foreclose a mortgage given by the Bristol County Street Railway in 1901 to secure a bond issue of \$200,000. In 1904 the company was declared bankrupt, and the receiver sold the property to persons who subsequently organized the Taunton & Pawtucket Street Railway. The latter company attacked the validity of the bond issue, but the full court now holds that all the real estate, fixtures and rights-of-way owned by the Bristol County Street Railway at the time of the receiver's appointment were covered by the mortgage and an enforceable supplemental agreement thereto.

Tidewater Southern Railway, Stockton, Cal.—An assessment of 10 cents per share was recently levied on the stockholders of the Tidewater Southern Railway. The assessment was effective on Oct. 4, and the sale date was set for Nov. 1.

Washington-Oregon Corporation, Vancouver, Wash.—It is said that plans are slowly materializing for the reorganization of the Washington-Oregon Corporation, which has for some time been in the hands of a receiver. Articles of incorporation have been filed for the Washington-Oregon Utilities Company with a capital stock of \$1,750,000, of which \$1,200,000 is to be preferred stock and \$550,000 common stock. The company is to have a life of fifty years. It will bid for the companies and assets of the Washington-Oregon Corporation when sold. Previous references to the latter company were made in the *ELECTRIC RAILWAY JOURNAL* of May 15 and July 31, the last noting an indefinite postponement of sale.

Wilmington Southern Traction Company, New Castle, Del.—The Wilmington Southern Traction Company, whose entire \$250,000 of common stock and \$100,000 of preferred stock are now owned by the Wilmington & Philadelphia Traction Company, as announced in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, has made a mortgage to the Wilmington Trust Company to secure \$300,000 of first mortgage 5 per cent gold bonds. The present issue of these bonds is to be \$231,000, the remainder being reserved for 85 per cent of the cost of new construction. The bonds are guaranteed principal and interest by the Wilmington & Philadelphia Traction Company.

Worcester (Mass.) Consolidated Street Railway.—Francis H. Dewey, president Worcester Consolidated Street Railway and also president New England Investment & Security Company, which controls the former property and the Springfield Street Railway, is reported to have said in a recent interview that there is no probability of the two sub-holding companies being merged in the immediate future. Old rumors in this connection were noted in the *ELECTRIC RAILWAY JOURNAL* of July 24. President Dewey now states that closer affiliation of the Worcester and Springfield properties will for the present be considered only as it relates to better service for the public. As to liquidation of the sub-holding companies and their consolidation, this will undoubtedly come in time as surely as it comes to all such companies, but it may not happen for ten years yet. It has been under consideration for at least five years and is no nearer a fact now than then.

Youngstown & Southern Railway, Youngstown, Ohio.—It is reported that the New York Trust Company, as trustee, has brought suit for the bondholders to foreclose the \$1,500,000 mortgage of the Youngstown & Southern Railway. The appointment of a receiver for this company was noted in the *ELECTRIC RAILWAY JOURNAL* of Jan. 30, 1915.

DIVIDENDS DECLARED

Green & Coates Streets Passenger Railway, Philadelphia, Pa., quarterly, \$1.50.

Kentucky Securities Corporation, Philadelphia, Pa., quarterly, 1½ per cent, preferred.

Nashville Railway & Light Company, Nashville, Tenn., quarterly, 1¼ per cent, preferred.

Public Service Investment Company, Boston, Mass., quarterly, \$1.50, preferred.

West Penn Railways, Pittsburgh, Pa., quarterly, 1¼ per cent, preferred.

Youngstown & Ohio River Railroad, Leetonia, Ohio, quarterly, 1 per cent, preferred.

Traffic and Transportation

JITNEY JOTTINGS

Hearing Before New York Commission on First Jitney Petition Under New Law Requiring Certificate from Commission

The application of the Troy Auto Car Company for a certificate of convenience and necessity was argued before the Public Service Commission for the Second District of New York on Oct. 6. Attorneys for the United Traction Company, Albany, opposed the petition. Witnesses for the jitney bus company testified that it has carried more than 200,000 passengers since the cars began to run on Fifth Avenue, Troy, through Lansingburgh. Attorneys for the United Traction Company contended that this was patronage to which that company was entitled in view of its large investments and its heavy expenses in Troy. Testimony showed that the bus line ran parallel to the electric railway and from one to three blocks or from 200 ft. to 1000 ft. to the east of it. The bus company sought to show the need of its service, while the traction company contended that the trolley service was adequate without the buses.

Charles H. Smith, assistant general manager of the United Traction Company, testified as to the service rendered in North Troy. He showed that the schedule provided a minimum of thirteen cars an hour north of Twelfth Street and many more to the south until more than fifty cars an hour were operating at Bridge Avenue in Troy. W. H. Elder, auditor of the company, testified as to the manner in which transfers could be obtained between the Lansingburgh lines and the other lines in Troy and to Cohoes, Waterford, Green Island, Watervliet and Albany. He said the United Traction Company operated 34 miles of single track in Troy. This was one-third of the company's total trackage. Exclusive of expenditures for equipment the company had expended in the last year \$124,000 in Troy for improvements and betterments. About \$90,000 was spent for the better equipment of the whole system. The annual payroll was \$483,000 divided among 732 employees in Troy, and \$85,350 was paid in taxes.

In the course of the testimony of Orville C. Bosca for the bus company it was brought out that the North End High School was on the line of the buses and that many of the students rode on the buses. The traction company attorneys called attention to the fact that the students had to pay the full 5-cent fare on the buses while the traction company afforded a half-fare school ticket. Mr. Bosca also testified as to the general character of the district served and the character of the patronage of the buses, their schedule and operation and their comfort and convenience. He said the buses ran on a fifteen-minute headway from 6 o'clock in the morning until midnight.

Commissioner Frank Irvine, before whom the case is being conducted, promised to make a personal inspection of the two lines through upper Troy before the next hearing, and both sides reserving the right to introduce further testimony, the case was adjourned until Oct. 15.

This petition is the first to be filed with the commission under the new law requiring its certificate for all bus lines in cities. In addition to this one there are now before the commission more than a score of applications for bus rights from cities in all parts of the State.

With the overruling of a demurrer filed by the Philadelphia city authorities in Common Pleas Court No. 4 in the suit of the Union Motor Bus Company to stop the enforcement of the jitney ordinance, a new action was begun in the same court by the People's Motor Club to restrain Director of Public Safety Dripps and the police from arresting drivers of "club" cars. An attorney representing the "club," which recently began to revive the jitney business on Broad Street, maintains that the organization has a legal right to extend its special privilege to its members, and that as a private organization it is exempt from the provisions of the jitney ordinance.

Jitney buses at Springfield, Ill., have been operating for several months without any regulation, but recently the

City Commission passed a regulatory ordinance. Immediately upon passage of this city law, A. D. Mackie, vice-president and general manager of the Springfield Consolidated Railway, announced that the company would come in under the ordinance and operate jitneys. Mr. Mackie is understood to be negotiating with a defunct jitney company in the West for the rental of a dozen motor buses, and it is said that he expects to complete the deal so as to put the buses in operation in Springfield by Nov. 1. Passengers will be given transfers from the buses to street cars and vice versa.

Several petitions, asking for an election on the proposition of placing the jitney operators under bond and other regulations, were placed in circulation at Houston, Tex., immediately following a special session of the City Council at which a resolution was adopted expressing a willingness to turn the question over to the voters for decision providing the people would petition for what they want. When the original jitney ordinance was passed the Mayor and a majority of the commissioners were opposed to the bond feature which was left out of the ordinance. Since then there has been an insistent demand by many citizens for an amendment of the ordinance to provide for a bond and other stringent regulations. The jitney men object to the election. They say that the bond feature would put them out of business, and they are preparing an ordinance, which is expected to be a compromise between those financially interested in the jitney business and the citizens at large who have been agitating regulations more strict than are imposed under the present ordinance. The jitney men's ordinance, to be submitted at an election, will reduce the license fee from \$72 to \$24 a year and provide for contributions from each jitney operator of a stipulated amount to a fund out of which will be paid indemnity for injury to passengers and pedestrians. The fund would be maintained by monthly assessments.

After jitneys have been operating in Victoria, B. C., for eleven months the City Council has passed a by-law regulating the traffic on practically the same lines as employed by other cities of the same class.

For the purpose of holding the jitney ordinance in abeyance until the next municipal election, Chauffeurs' Union No. 163 at Portland, Ore., has filed with the city auditor referendum petitions containing the signatures of nearly 12,000 citizens. Unless the Supreme Court holds that the use of the emergency clause on ordinances is valid there will be no ordinance in Portland regulating the jitneys until 1917. If the Supreme Court holds that the city has the power to pass emergency ordinances there will be immediate regulation of the jitneys under the ordinance.

The City Council of Jacksonville, Fla., has passed a jitney regulatory measure. The new bill requires among other things that any company operating more than one line of buses shall give transfers on all its lines. A bond of from \$2,500 to \$50,000 will be required, according to the number of passengers carried.

The National Indemnity Exchange, organized to write jitneys, has been licensed in Missouri, Oklahoma and Minnesota, and is now seeking entrance to Arkansas. Applications for the right to do business in California and Pennsylvania will probably follow shortly. The largest business has probably been done in Minneapolis. In many cities of the States mentioned the jitney owners are not ready to take insurance, because the owners fear the ordinances that are passed may require bonds, and they cannot afford both bonds and insurance. In many cities the bonds required are now so large that there is little chance of auto owners taking insurance. A call came recently from New Orleans, where several hundred jitney owners wanted insurance, and where it was said local ordinances would permit the writing by the National Indemnity Exchange, but Louisiana has no law relating to inter-insurance, and there, as in Texas, the exchange must wait the solving of that problem. In some States, State laws require jitneys and livery owners to give a bond which eliminates the insurance feature.

The city of Kokomo, Ind., has passed a jitney law, under which a bond of \$3,000 is required for all five-passenger cars, with \$500 added for each additional passenger carried. All buses are to be inspected by the chief of police

and not more than 5 cents can be charged for one continuous trip through the city. An annual license fee of \$50 is required for each five-passenger bus with \$10 more for each additional passenger.

FAILURE OF AUTOMOBILE FREIGHT SERVICE

Well-Developed Automobile Freight Service at Los Angeles on Decline

The jitney freight business in southern California has apparently run its course and commenced a decline almost as rapid as the start, according to reports from Los Angeles. It was believed a year or two ago, according to the *Southwest Commercial Bulletin*, that the automobile truck in southern California would practically supplant the steam and electric railways in handling merchandise between Los Angeles and southern California towns. A study of the situation recently, however, developed the fact that, like the jitney bus, the interurban truck has lived but a little while and now is rapidly ceasing to be.

A few days ago the largest interurban auto truck concern operating in Los Angeles announced that service had been discontinued to two more cities—Anaheim and Fullerton. About a year ago it was possible to get auto truck service at railroad rates to practically every village and hamlet in that part of the State, including points as far distant as San Bernardino. At that time there were dozens of individual truck owners.

The scheme apparently worked well for a few months, but two difficulties developed. The first came when inexperienced and short-sighted private owners began to find that overhead and depreciation on their machines more than ate up their net receipts for handling freight. The second developed in the form of opposition from jobbers and manufacturers who were unwilling to trust valuable merchandise to irresponsible and unknown parties, who in the event of loss and damage could offer no guarantee. In an effort to obviate these difficulties a well-financed company was organized. This company bought fifty or sixty auto trucks and the opinion seemed to be general that these modern machines could be operated over southern California's wonderful system of paved roads at a profit, despite the keen competition of the steam and electric lines. The company also put up a bond for the protection of jobbers against the loss of their merchandise, thus overcoming in a measure the second objection. At first they covered nearly all points but, as indicated above, have slowly cut down until now only a few of the larger near-by towns are served. Apparently, the business did not prove profitable. When asked why the automobile truck apparently had proved impracticable in the interurban handling of merchandise here, a local jobber said:

"The rail lines have all the advantage. We may dream all we want to about competing with them, but they can handle merchandise for a great deal less money than can the auto truck. The life of a box car, they tell me, is more than twenty years. It costs \$1,400 against \$3,000 or \$4,000 for a good auto truck, and yet has four or five times the capacity. An auto truck is junk in three or four years. Another reason is that somehow the merchant expects more of the truckman than he does of the railroad. He will go to the station with his own wagon and pick up freight without the least question, but if he orders it sent by auto truck he expects it delivered on his sidewalk without additional expense. Thus the auto people give more for the money than the railroads. Another trouble is breakage. Despite the greatest care, you will find that the percentage of breakage and loss on auto trucks is materially larger than over the same mileage by rail. The railroads have the advantage of fifty years of evolved system in handling goods, and this tells in the final analysis."

Those who have advocated interurban trucking at Los Angeles express the keenest disappointment that it seems to be a failure. They say that if it cannot succeed here under present conditions it certainly cannot succeed any place else. They point out that nowhere in the world are roads and climatic conditions better than in southern California for such a test. They further point out that the experiment has been well financed and the equipment has been of the highest order.

Directing the Fair Visitor.—The Topeka (Kan.) Railway used large display space and received liberal co-operation from the newspapers in informing the public as to service during the free fair recently. All conductors wore badges, on which was printed "Ask Me," a custom followed by the company during all large gatherings in the city. The railway's business during the week of the fair was 350,000 fares and transfers, of which it is estimated that about 110,000 were people attending the fair. The company built a special spur into the fair grounds.

Three Out of Four Los Angeles Hospital Cases Traffic Accidents.—Los Angeles hospital records show that during the past twelve months more than 9000 cases out of a total of 12,000 entered at the receiving hospital in that city have been due to traffic, practically all automobile. A conference of the police officials, the police court judges and Police Surgeon Wiley followed the report that 75 per cent of all emergency cases in the city are caused by traffic. It was shown that recklessness, ignorance and irresponsibility on the part of motorists cost several hundred lives yearly. Traffic accidents alone made necessary an enlargement of the receiving hospital and the maintenance of a larger ambulance corps. As a result of the conference it was decided to increase the traffic squad, dismiss the commission form of dealing with offenders and require every lawbreaker to go to the police court.

Service Advertised in Kansas City.—The Metropolitan Street Railway, Kansas City, Mo., continuing its practice of using display space in the newspapers to inform the public of details of service, recently published an advertisement containing an illustration of Electric Park illuminated, and notifying patrons of the routing of cars to the park during a manufacturers' and merchants' exhibition. An even more striking and serviceable advertisement was one in reference to owl cars. This advertisement showed the outlines of an owl, the eyes formed of headlights, the feet resting on an electric car that was shown illuminated, the moon in the background. The reading matter consisted of the full schedule of owl car service on all lines, with terminals mentioned so that patrons could determine their transfer connections. The hands on a clock in the distance pointed to a few minutes past midnight.

Inducing Excursions Into the Country.—The Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company are making a special effort to interest people in the fall scenery which is to be viewed from the tops of the Silver Hills. At the instance of the companies the local papers in Louisville, Ky., have been taking notice of the numbers of trolley parties which have been made up to take the trip over the river. In connection with what the *ELECTRIC RAILWAY JOURNAL* said some time ago about the plans of the Louisville & Interurban Railroad to interest Louisville people in the fall scenery, one of the Louisville papers noted editorially at considerable length that the trips were well worth taking and would reward those who made them. The indulgence of the conductors toward those who brought large bunches of their flowers aboard the cars was alluded to in a most appreciative way.

Handling Traffic at the Astor Cup Race.—During the day of the Astor Cup Race on the new Sheepshead Bay Automobile Speedway, Brooklyn, N. Y., on Oct. 9, ample provision was made by the Brooklyn Rapid Transit System for handling the passenger traffic to and from the race. Special six-car train express service was furnished at frequent intervals over the Brighton Beach rapid transit line between Park Row, Manhattan, and the Sheepshead Bay Speedway, at which latter place a terminal had been provided for the unloading of patrons of races formerly held on the old Sheepshead Bay race track. Extra ticket selling booths were in operation at the Park Row station and sixteen ticket sellers were employed at the Sheepshead Bay terminal during the rush for trains directly after the race. An additional fare of 5 cents besides the ordinary 5-cent fare was collected at the Sheepshead Bay terminal. While the attendance at the race was estimated at 100,000 the price for seats and admission was such as to confine the race-goers largely to the automobile owning or hiring class. On this account, despite the huge attendance, the problem of transportation did not present unusual difficulties.

Personal Mention

Mr. L. M. Taylor, Champaign, Ill., has been appointed contracting freight and passenger agent of the Illinois Traction System to be associated with Mr. E. E. Kester.

Mr. W. H. Torrey has been appointed purchasing agent of the Toledo Railways & Light Company, Toledo, Ohio, succeeding Mr. H. W. Thompson, who has returned to Denver.

Mr. Harry O'Brien, superintendent of overhead of the Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has been appointed by the company to the position of superintendent of telephones, interlocking plants and bonding.

Mr. James Couzens, who has resigned as vice-president and general manager of the Ford Motor Company, Detroit, Mich., is president of the Street Railway Commission of that city, which has conducted the negotiations with the Detroit United Railway for the sale of the lines of the company in Detroit to the city. Approval of this purchase is to go before the voters at the election in Detroit on Nov. 2.

Prof. W. S. Franklin, who recently resigned as head of the department of physics of Lehigh University, South Bethlehem, Pa., will spend the fall and winter in making a lecture tour through the West and South. The lectures will be given principally in universities and technical schools and will cover appropriate topics such as wave motion, mechanical analogies in electricity and magnetism, phenomena of fluid motion, etc. Professor Franklin has been connected with Lehigh University almost continuously since 1897, having previously taught at the University of Kansas and the Iowa State College. He is the author of a number of books on physics and electrical engineering.

Mr. John J. Cooper, who was elected president of the Colorado Electric Light, Power & Railway Association at its Glenwood Springs convention, is secretary and operating manager of the Gilpin County Light, Heat & Power Company, the Arkansas Valley Electric Company and the Brush Light & Power Company and is vice-president of the Hinsdale Mining & Development Company. He has lived twenty-five years in Colorado and has always been engaged in the electrical business, having worked his way up from office boy and stenographer. He was at one time manager of the Trinidad Gas & Electric Company, Trinidad, Col., and is at present stationed in Denver as manager of the supply department of the Mountain Electric Company.

Mr. H. O. Marler, whose appointment as traveling passenger agent of the Pacific Electric Railway, with headquarters at Los Angeles, Cal., was noted in the *ELECTRIC RAILWAY JOURNAL* of Sept. 25, started railroading at the age of fifteen as office boy and clerk in the general auditor's office of the Santa Fé Railroad in Los Angeles, where he remained until July 31, 1904. On that date he resigned to enter the service of the Los Angeles Pacific Railroad, one of the first electric railroads of California. With the latter company Mr. Marler acted as clerk, receiving cashier, assistant agent and agent respectively until the consolidation of the Los Angeles Pacific Railroad and the Pacific Electric Railway, when he was appointed to the position of ticket stock clerk. Subsequently he served as traveling traffic inspector and chief clerk in the general passenger department, remaining in the latter position until his recent appointment as traveling passenger agent.

Mr. E. L. Moore, superintendent of transportation of the Evansville (Ind.) Railways, has in addition been appointed roadmaster of the company to succeed Mr. E. W. Wheeler. Mr. Moore's first railway experience was with the Johnstown (Pa.) Street Railway, the employ of which he entered in 1900 as a trainman. Later he accepted a position with the Cambria Steel Company, and in 1902 he moved to Columbia, Ind., and accepted a position as conductor on the lines of the Indianapolis, Columbus & Southern Traction Company. During the construction of the extension from Columbus to Seymour in 1907 Mr. Moore worked as construction foreman. On Aug. 1, 1908, he accepted the position of trainmaster of the Evansville Railways, and in July, 1912, he was appointed superintendent of transportation, his control extending over

the city lines of Henderson, Ky., operated by the Henderson Traction Company. On the resignation of Mr. Wheeler as roadmaster of the company Mr. Moore assumed the duties of that position.

Mr. Orin B. Coldwell, general superintendent of the light and power department and electrical engineer of the Portland Railway, Light & Power Company, Portland, Ore., heretofore in charge of the construction and operation of the light and power department, will have added to his duties those of the commercial department which have been discharged by Mr. F. W. Hild, former general manager, who has assumed the office of vice-president and general manager of the Denver Tramways. No general manager will be appointed to take the place of Mr. Hild, but the duties heretofore discharged by him will be divided among other members of the executive staff. Mr. Coldwell has been connected with the electrical end of the company from boyhood, except during the time he was at Stanford and Cornell Universities. Mr. Coldwell has resided almost entirely in Portland. He is thoroughly familiar with the operations of the company, having worked his way up from the lower ranks through positions of foreman and superintendent in nearly all of the construction done by the Portland Railway, Light & Power Company and its predecessors.

Mr. J. J. Rockwell has rejoined the staff of the McGraw Publishing Company, Inc., publisher of the *ELECTRIC RAILWAY JOURNAL*, in the capacity of advertising counsellor to that company and its customers, and will make his headquarters at the company's general offices in New York. Since Mr. Rockwell's previous association with the McGraw Publishing Company, during the years 1910 and 1911, he has been engaged in the advertising agency business in Chicago in connection with the Crosby-Chicago Advertising Agency. In earlier years he was associated with the Mahin Advertising Company and the Long-Critchfield Corporation, both well-known advertising agencies in Chicago. His work as an advertising expert has frequently excited highly favorable comment and his long experience in the general agency business, as advertising manager, in publishing fields, and as counsellor for advertisers in many lines of business, and his special and unusual experience in industrial and technical fields, should enable him to be of peculiarly valuable service to the McGraw Publishing Company and its customers.

Mr. T. P. Kilfoyle, whose election as president of the American Electric Railway Accountants' Association on Oct. 6 at the San Francisco convention was noted in the

T. P. KILFOYLE

ELECTRIC RAILWAY JOURNAL of Oct. 9, is auditor of the Cleveland (Ohio) Railway, operating 344 miles of line and 1157 motor cars and 426 other cars in Cleveland, "The Sixth City," and vicinity. He has been auditor of the railway since March 1, 1910, and previous to that time was connected with the auditing department of the company for a number of years except during the short interval while the Cleveland Electric Railway was being operated by the Municipal Traction Company during the administration of former Mayor Tom L. Johnson. Prior to the time when he became connected with the Cleveland Railway, Mr. Kilfoyle was general auditor for the Warren Bicknell Company, Cleveland, Ohio, which operated the Cleveland, Lake Shore & South Bend Railway, the Youngstown & Ohio River Railway and the Springfield & Xenia Railway. Mr. Kilfoyle has been connected with the street and electric railway business for the last eighteen years. Mr. Kilfoyle was born in Cleveland on June 28, 1868. He has been first vice-president of the American Electric Railway Accountants' Association for two terms and has served in other years on the executive committee of the association.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Bellevue & Western Railway, Bellevue, Mo.—Incorporated in Missouri to construct a railway from Graniteville to Bellevue, about 3 miles. Capital stock, \$40,000. Incorporators: William R. Orthwein and Louis Hudson, St. Louis, and J. H. Long, Bellevue.

*Washington-Oregon Utilities Company, Vancouver, Wash.—Incorporated in Washington to take over the property of the Washington-Oregon Corporation to be sold under foreclosure. Capital stock, \$1,750,000, of which \$1,200,000 is to be preferred stock and \$550,000 common stock.

FRANCHISES

Los Angeles, Cal.—The City Railway has received a franchise from the Council for the construction of a line on South Park Avenue from Thirtieth Street to Slauson Avenue.

San Jose, Cal.—The San Jose Railroads has received a franchise from the Council for the construction of a modern standard-gage line from the northeasterly city limits of San José to Linda Vista.

Coeur d'Alene, Idaho.—The Spokane & Inland Empire Railroad has received a franchise from the Council to construct a single-track steam and electric railway along certain streets in Coeur d'Alene.

Rockport, Ind.—The Evansville Railways have received a franchise from the Council to construct a line on Washington Street to the bank of the Ohio River.

Franklin, Mass.—The Milford, Attleboro & Woonsocket Street Railway has asked the Council for a franchise to relocate its tracks on Central Street, Franklin.

Buffalo, N. Y.—The International Railway has asked the Council for a franchise on Bailey Avenue between Kensington Avenue and East Delavan Avenue and between East Ferry Street and Seneca Street. The company holds franchises to all of Bailey Avenue except between the streets named. It desires permission to operate double-track lines over the entire length of Bailey Avenue, thus linking the south with the north in an unbroken line.

Utica, N. Y.—The New York State Railways has received a fifty-year franchise from the City Council of Utica to extend its Elm Street line through James Street to Neilson Street.

Elyria, Ohio.—The Cleveland, Southwestern & Columbus Railway has received a twenty-five year franchise from the Council to operate a railway in Elyria. Concessions gained by the city include twenty-minute city service and six tickets for 25 cents.

Pawtucket, R. I.—The Rhode Island Company has asked the Council for a franchise to relocate its present track and lay additional track on Broad Street from Exchange Street to Miller Street, Pawtucket.

Dallas, Tex.—The Dallas Northwestern Traction Company and the Dallas Southwestern Traction Company have received from the Board of City Commissioners an extension of six months on their franchises in which to begin construction of their proposed lines to Denton on the north and Glen Rose on the south. [May 1, '15.]

Dallas, Tex.—The Northern Texas Traction Company has received a franchise from the Council to operate a double-track line on Jefferson Street between the Oak Cliff viaduct and Commerce Street.

Steilacoom, Wash.—The Tacoma Railway & Power Company has received a fifty-year franchise from the Council to build an extension from Steilacoom Boulevard to Starling Street, along Starling Street to Steilacoom Street, along Steilacoom Street to Union Avenue and along Union Avenue to Lafayette Street. The franchise also permits

the abandonment of the old line along Lafayette Street between Wilkes Street and the town limits.

TRACK AND ROADWAY

Florence & Huntsville Interurban Railway, Florence, Ala.—A preliminary survey has been made by this company between Florence and Elk River, 27 miles, and it is expected that the entire survey between Florence and Huntsville will be completed soon. Thurston H. Allen, Florence, secretary. [March 20, '15.]

Pacific Electric Railway, Los Angeles, Cal.—This company has filed a petition with the California Railroad Commission for permission to construct more than twenty grade crossings and one under-grade crossing along the Hawthorne cut-off between Watts and Redondo Beach, a franchise for which has been granted.

San José (Cal.) Railroads.—Work has been begun by this company on the construction of a modern standard-gage electric line from the northeasterly city limits of San José to Linda Vista, in place of the present narrow-gage line. The old line will be used from Linda Vista to Toyon.

*Coeur d'Alene, Idaho.—The project of an electric railway system joining the principal towns of the Coeur d'Alene district and extending to Coeur d'Alene has been revived. Prior to the present European war the enterprise had been successfully financed. French capitalists had sent their engineer here to report on the proposed road, and the report was favorable to early construction. Among the local people interested are Herman J. Rossi, Hugh Toole and William Fishinger, all of Wallace.

Lewiston-Clarkston Transit Company, Lewiston, Idaho.—Work will be begun by this company within ninety days on the construction of a 1¼-mile extension in Clarkston. The route to be followed will be south on Sixth Street to Highland Avenue and west on Highland Avenue to Thirteenth Street. The company has already asked the Council for a franchise to construct and operate the proposed line.

Chicago & Milwaukee Electric Railroad, Chicago, Ill.—This company will remove the old rails in Washington Street, Waukegan, from Sheridan Road to Spring Street. These rails were used when the old Bluff City Electric Railroad operated cars in Waukegan. The company has ordered from the Wisconsin Bridge & Iron Company 225 tons of material for the construction of a bridge near Milwaukee.

Keokuk-Jefferson City Electric Railway, Keokuk, Iowa.—In connection with this company's proposed line from Keokuk, Iowa, to Jefferson City, Mo., a meeting was held in Paris, Mo., at which a committee was appointed to raise \$1,350 among the citizens for the survey of the line through Paris. Practically all of the amount has been raised. Funds for the survey have already been subscribed in Clark and Lewis Counties and are being solicited at Shelbyna. H. W. Knight, Chicago, is interested. [Oct. 9, '15.]

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—Work on this company's extension to Lawrence is progressing rapidly and it is expected that cars will be operated into Lawrence by the first of the year. Construction of the line to Topeka will be begun as soon as the Lawrence section is completed and operating.

Arkansas Valley Interurban Railway, Wichita, Kan.—This company's extension to Hutchinson is practically completed and it is expected that the track will be ready for the operation of cars to the city limits within five weeks.

*Baltimore, Hancock & Berkeley Springs Railroad, Baltimore, Md.—Rights-of-way are being purchased for a proposed electric railway to be built from Hancock to Berkeley Springs. Littleton F. Johnson and J. M. Savin, Baltimore, are interested.

St. Paul (Minn.) Southern Electric Railway.—Grading has been begun at White Rock on the Zumbrota extension of the St. Paul Southern Electric Railway. The completion of the line to Rochester will give this company the shortest route to that city from St. Paul, 86 miles.

Hattiesburg (Miss.) Traction Company.—An agreement has been reached between the citizens of Hattiesburg and the Hattiesburg Traction Company whereby the company will extend its lines to the Woman's College at once.

Metropolitan Street Railway, Kansas City, Mo.—Work has been begun by this company on the construction of tracks on Main Street from Twenty-fourth Street to Twenty-seventh Street, through the big cut south of the Union Station.

City Electric Company, Albuquerque, N. M.—This company has taken over the property of the Albuquerque Traction Company sold at a special master's sale on Oct. 1. George Roslington is president of the new company and Lloyd Sturges secretary and treasurer.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The Public Service Commission for the First District of New York has approved the contract and plans submitted by this company for the construction of foundations and structure of Section No. 2 of the Jamaica elevated extension. This comprises 2.2 miles of two-track elevated railway extending from Walnut Street along Jamaica Avenue to Cliffside Avenue. The commission also approved the form of contract submitted by the company for the erection of steel for additional tracks on the Myrtle Avenue line from Willoughby Avenue to Palmetto Street, as well as for certain additional work on the Lutheran Cemetery line.

New York State Railways, Syracuse, N. Y.—Work has been begun by this company raising and improving its track on Douglass Street between Graves and Oak Streets, Syracuse. The work will cost about \$9,075.

Cleveland & Ohio Central Electric Railway, Cleveland, Ohio.—Steps are being taken to secure final right-of-way for this company's proposed line. Construction will be begun as soon as the right-of-way is obtained. E. A. Norton, Cleveland, general manager.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—Plans for the proposed interurban line between Galena, Baxter Springs, Columbus and Miami were furthered at a recent meeting of the Galena Commercial Club. The company is ready to begin construction on the line as soon as the \$10,000 bonds asked from Galena are voted and the right-of-way obtained. A committee was appointed to go over the proposed route and obtain an estimate of the cost of purchasing terminals and obtaining a right-of-way to Baxter Springs, 5 miles west of Galena, and after the estimate is made to go before the Council and ask it to call a bond election. [Sept. 25, '15.]

Sandwich, Windsor & Amherstburg Railway, Windsor, Ont.—This company will make application to the Ontario Railway Board for permission to extend its tracks on Ottawa Street and Strabane Avenue, Ford City.

Rhode Island Company, Providence, R. I.—Plans are being considered to double-track this company's line on Chalkstone Avenue from Smith Street to Mount Pleasant Avenue. The plan also involves the possible extension to Unit Street.

***Sumter, S. C.**—Plans are being considered to build an electric railway from Sumter to Shiloh, thence via Turbeville to Olanta, about 32 miles. It is reported that the Chamber of Commerce of Sumter is interested. E. I. Reardon, Sumter, is secretary of a committee in charge of surveys, rights-of-way, etc.

Carolina, Greeneville & Northern Railroad, Greeneville, Tenn.—Bristol has been definitely decided upon as the terminus of the Carolina, Greeneville & Northern Railroad. Bristol and Sullivan County subscribed and paid nearly \$20,000 toward the preliminary survey, options on rights-of-way, terminal and factory sites, etc. The new line will be built between Bristol and Knoxville via Kingsport, Newport and Sevierville. The new road will use electric power but will be equipped to handle freight cars of the connecting steam roads. [July 10, '15.]

Houston, Richmond & Western Traction Company, Houston, Tex.—Engineers will be in the field within the next thirty days locating the line for the Houston, Richmond & Western Traction Company and actual construction will be begun within sixty days thereafter. The line will extend between San Antonio and Houston, entering each of these cities over the local traction company's rails. Passengers and express will be handled. Motive power will be supplied largely from the Guadalupe River at Seguin and

Gonzales. Two routes are being considered for the interurban, one by way of Seguin, Gonzales and Columbus, and known as the northern route, the other by way of Sutherland Springs, Cuero and Yoakum, and known as the southern route. E. Kennedy, who is promoting the line, has already obtained bonus and stock subscriptions amounting to nearly \$300,000. He anticipates raising an additional \$200,000, represented by town sites and right-of-way. [Sept. 25, '15.]

Ogden, Logan & Idaho Railway, Ogden, Utah.—This company has completed its extension from Ogden to Preston and operation will soon be begun.

Petersburg & Appomattox Railway, Petersburg, Va.—The grading on the Petersburg & Appomattox Railway, which is expected to link Petersburg with Hopewell and City Point on or before Jan. 1, is progressing rapidly. The work has been completed as far as Cedar Level, and a considerable amount of material to be used in the construction of the road has been delivered. Cross-ties are being spread along the right-of-way and the laying of rail will be commenced at Cedar Level within a few days. [Aug. 21, '15.]

Chicago & Wisconsin Valley Railroad, Madison, Wis.—It is reported that this company will resume construction at once on its line between Portage and Madison. J. E. Jones, president. [June 19, '15.]

SHOPS AND BUILDINGS

Wilmington & Philadelphia Traction Company, Wilmington, Del.—The power house of the People's Railway at Sixth and Hawley Streets is now being converted into a carhouse by the Wilmington & Philadelphia Traction Company. The merged systems will receive power from the plant of the company on the Brandywine. The carhouse at Delaware Avenue and duPont Street is being enlarged 30 ft. x 139 ft. The new shops, which will be 30 ft. x 100 ft., will also be located at Delaware Avenue and duPont Street.

Union Traction Company, Indianapolis, Ind.—This company will remove its station at Alexandria, Ind., to a point nearer the business section of the city.

Arkansas Valley Interurban Railway, Wichita, Kan.—Work has been begun on the construction of this company's \$10,000 terminal at Hutchinson.

Lehigh Traction Company, Hazleton, Pa.—Work has been begun by this company on the construction of a new carhouse near Hazle Park.

Philadelphia & Western Railway, Upper Darby, Pa.—Steps will soon be taken toward the erection of a new station at Norristown for the joint use of the Philadelphia & Western Railway and the Lehigh Valley Transit Company, whose lines connect at that point, to relieve the congestion now caused by the loading and unloading of cars of both lines in the middle of the street. At a conference of railway officials and the highway and railway committees of the Norristown Borough Council, it was the unanimous judgment that the station should be an overhead structure. The engineers of both companies are now working on the plans.

Ogden, Logan & Toledo Railway, Ogden, Utah.—Among the improvements to be made by this company is the construction of carhouses, storehouses and repair shops amounting to from \$145,000 to \$160,000.

POWER HOUSES AND SUBSTATIONS

Cumberland & Westernport Electric Railway, Cumberland, Md.—This company has purchased additional coal land at Reynolds, adjacent to a mine that has supplied the power house at that point for twelve years. It is expected that considerable saving will be effected by the operation of the new mining property.

Burlington (Vt.) Traction Company.—This company will install one 500-kw. 600-volt d.c., six-phase, 60-cycle, 900-r.p.m. compound-wound a.c. self-starting rotary converter; three 165-kva., 2400-volt, high-tension to rotary converter voltage low-tension, single-phase 60-cycle O. I. S. C. transformers and one two-panel switchboard. The apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Manufactures and Supplies

ROLLING STOCK

Des Moines (Iowa) City Railway is reported as planning to purchase twenty-five new steel cars. This item has not been confirmed.

Trenton & Mercer County Traction Corporation, Trenton, N. J., is reported as preparing specifications for ten new city cars. This item has not been confirmed.

Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa, has added a new single-truck folding step car to its Fort Dodge Street Railway equipment. The car is of the same type heretofore used by this company.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y., was noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9 as having issued specifications for the new double-truck cars. These cars will be 45 ft. 1½ in. over all and will be of all-steel construction, steel carlines being used. The United Gas & Electric Engineering Corporation, New York, which prepared the specifications, has designed the car closely after the type of the new New Orleans cars, except that it will be slightly shorter and will have cork insulation for its roof and sides. These cars will be for city service in Erie, Pa.

TRADE NOTES

W. McKay White has resigned as sales manager of the Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights.

Johnson Fare Box Company, Chicago, Ill., has received an order to equip with fare boxes the ninety-two new cars ordered by the Connecticut Company, which will be operated in New Haven, Bridgeport and Hartford.

W. S. Miller, who resigned as general superintendent of the St. Louis Car Company last November, has moved from his home in St. Louis and has purchased a 140-acre improved stock farm at St. James, Mo. After this enterprise has been thoroughly organized Mr. Miller hopes to locate with some company either in the manufacturing or selling end.

Root Spring Scraper Company, Kalamazoo, Mich., has received an order to equip all the cars of the Michigan Railway's 2400-volt third-rail line from Kalamazoo to Grand Rapids with its No. 3 pneumatically operated scraper. This completes the equipment of all city and interurban cars owned and operated by the Michigan United Traction Company and the Michigan Railways.

Western Electric Company, New York, N. Y., has leased the thirteenth, fourteenth and fifteenth floors of the new Telephone & Telegraph Building at 195 Broadway, to be occupied by the general departments now located at New York, with the exception of the engineering and patent departments. It is expected that the removal into this building will take place during the summer of 1916.

Union Switch & Signal Company, Swissvale, Pa., announces the appointment of George A. Blackmore as general sales manager in charge of the activities of the New York, Montreal and Atlanta offices, with headquarters at New York. Resident Managers A. Dean of New York, T. H. Patenall of Montreal and Sales Engineer Brastow of Atlanta will report to him. He will eventually be located in Swissvale in charge of sales, construction and commercial engineering.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., announces that, effective Aug. 1, the sale of the standard product of the Westinghouse Machine Company will be handled by the prime mover department of the electric company. E. H. Sniffin, formerly vice-president and sales manager of the Westinghouse Machine Company, has been appointed manager of the prime mover department, and as such will direct the sales of the product of this company as he has done in the past. Mr. Sniffin became associated with Westinghouse, Church, Kerr & Company in 1888, first as salesman and afterward as sales manager. In 1903, when the Machine Company organized a sales department, Mr. Sniffin was made sales manager. Subsequently in 1905 he was elected vice-president, which posi-

tion he held at the time of the organization of the prime mover department of the electric company. A marine department of the Westinghouse Machine Company has also been established, with headquarters at East Pittsburgh, which will handle all matters pertaining to the sale of marine refrigeration and main propulsive machinery for vessels and auxiliaries using this class of apparatus.

ADVERTISING LITERATURE

General Fire Extinguisher Company, Providence, R. I., has issued a circular describing the successful results obtained from installing the Grinnell automatic sprinkler in a large number of plants and factory buildings.

Internal Combustion Locomotive Company, Inc., Wilmington, Del., has issued Bulletin No. 1 describing its internal-combustion locomotives and railway motors, for railway and street car service, also for industrial usage. Fuel for this method of operation may be gasoline, kerosene or distillates. The locomotives are built for heavy grades and sharp curves and range in weight from 5 tons to 50 tons. Only one man is necessary for operation.

S. K. F. Ball Bearing Company, New York, N. Y., has issued an ingenious advertising circular entitled, "Read What a Few Users Say About S. K. F. Ball-Bearing Hangers," which includes a large number of testimonial letters as to the effective use of the ball-bearing hangers. The circular is prepared in quick reference form. The bottom of each page extends beyond the preceding page. On each margin of extension the substance of each testimonial letter is summed up in one sentence, so that each summary is legible without turning over the pages of the circular.

C. A. Wood-Preserver Company, Inc., St. Louis, Mo., has issued a sheet describing examples of the longer life of treated as compared with untreated ties. This contention is well supported by an illustration showing the difference of condition between a treated and an untreated tie of equal time length of service, which were removed from a test track of the Denver City Tramway Company. Mention in the folder is also made of successful results obtained from service on the Asheville (N. C.) Street Railway, Los Angeles (Cal.) Railway, Ohio Electric Railway, Galveston (Tex.) Electric Company, Minneapolis (Minn.) Street Railway, Union Electric Light & Power Company and Greenville (S. C.) Traction Company.

JOVIANS HOLD ANNUAL CONVENTION IN CHICAGO

Business sessions addressed by prominent men in the electrical industry and extraordinary entertainment features marked the thirteenth annual convention of the Jovian Order held at the Hotel Sherman, Chicago, Ill., Oct. 13, 14 and 15, 1915. Reigning Jupiter Homer E. Niesz and his general convention committee did themselves proud in preparing and conducting the business and entertainment program of the convention. The principal addresses were delivered by E. W. Lloyd, vice-president Commonwealth Edison Company, Chicago, and president of the National Electric Light Association, who spoke on "Extending the Utilization of Electrical Energy"; H. M. Byllesby, president H. M. Byllesby & Company, who spoke on "The Public Utility as a Factor in the Development of a City"; Ernest McCleary, past president National Electric Contractors' Association, who spoke on "Safety in Electrical Installations"; John F. Gilchrist, vice-president Commonwealth Edison Company and president Electric Vehicle Association of America, spoke on "Contingent Benefits from Promotion of Electric Vehicle Sales," and H. L. Doherty, president Doherty Operating Company, who addressed the association on "The Relation of the Jobber to the Electrical Industry." Entertainment features included a luncheon tendered by the association of commerce of Chicago Oct. 13, where an address was delivered by Dr. Frank W. Gunsaulus; a reception and dance given by the executive officers and the Past Jupiters' Association Wednesday evening; a luncheon tendered by the Electric Club-Jovian League of Chicago, Thursday; degree team competition at Powers' Theater, Thursday afternoon; annual rejuvenation with a class of approximately 300 candidates, Thursday evening, and the Feast of Jupiter, Friday evening.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, OCTOBER 23, 1915

No. 17

BIGGER AND BIGGER STEAM TURBINE UNITS

The rate of development of the art of steam turbine construction is indicated by the fact that just about three years ago, in the issue of the *ELECTRIC RAILWAY JOURNAL* for Oct. 5, 1912, to be exact, we were describing the 20,000-kw. turbines then in process of installation in the new Northwest station of the Commonwealth Edison Company in Chicago. That plant was laid out to contain twelve such units in two buildings. Two units were installed at the outset but the program has now been altered so that there will soon be added a 35,000-kw. unit, the largest yet ordered. While it is true that a turbine of 35,000-kw. capacity has been placed in Philadelphia, the Chicago turbine is rated at a lower power factor, hence is actually larger. While the largest turbines producing power exclusively for street railway purposes are those in the Seventy-fourth Street power plant of the Interborough Rapid Transit Company in New York, both the Commonwealth Edison and Philadelphia Electric companies furnish large amounts of power for traction purposes. Hence these great turbines can be properly considered a part of electric railway progress. The causes impelling the increase in size of unit are numerous. The increasing concentration in power production renders practicable the economical loading of large units. It thus becomes possible to take advantage of the small floor space, fuel consumption, operating costs, etc., of the large unit. If the present rate of increase in size of unit is maintained, and it may be estimated at 5000 kw. per year, but three years will elapse before the 50,000-kw. unit, now the subject of vague rumors, will become a reality. There is no apparent reason why it should not do so. The magnitude of these giants is indicated by the fact that a single 50,000-kw. unit would furnish power for 1600 20-ton cars, or for 2,000,000 20-cp. incandescent lamps, enough for a city of very considerable size.

WANING PROBLEM OF MOTOR-BUS COMPETITION

To those super-enthusiasts who have prophesied the throttling of interurban freight and express business by the motor bus we commend the account published last week regarding the latter's very comprehensive failure in southern California. Following the lead of the jitney, motor-bus competition for long-distance express traffic has in this case started down hill, and the net result of a costly experiment has been that a number of people have learned that the terminal handling and transfer of freight, which is eliminated by the motor bus, is but a small part of the cost of

service. This is something that could have been much more readily demonstrated by a little investigation and a few calculations, but because it contained one factor that made for profit, the business was inaugurated on a large scale under the fine old doctrine of optimism that advocates first to make the leap and then to look. It is, perhaps, especially fortunate that the bogey of motor-bus competition in freight service has been exposed at this time. The electric railways sadly need a relief from the bedevilment that has come from this new form of transportation, and there are still two features in connection with it that display evidences of activity. One of these is the growth of the privately-owned automobile; the other is bus service *de luxe* at an increased fare, and while the latter does not appear any more alarming than the original "jitney menace," the former provides enough material for the electric railways to worry about without having to include any other motor-bus problems.

REPORTING THE SAN FRANCISCO CONVENTION

Considerable interest having been expressed as to the manner in which the *ELECTRIC RAILWAY JOURNAL* was able to mail a 94-page paper, containing a practically complete report of the proceedings, on the day following the closing of the San Francisco convention, a few facts regarding the circumstances are given. It has been customary for the paper to issue four dailies during each convention, giving the proceedings day by day. This year this plan would have meant that the dailies, mailed in San Francisco, would not have brought their report of the convention to our subscribers in the East until a week or so after the convention closed. Hence an adequate telegraphic report was substituted. For the convenience of the convention attendants, however, a small daily bulletin containing matter of transient and local interest was printed and distributed at San Francisco. In reporting the discussion at San Francisco and the papers that were not available in manuscript form previous to the calling of the convention, a total of nearly 18,000 words was telegraphed, the last message being received at 7.40 Eastern time, Friday evening. The lateness of the last dispatches was due to the considerable difference in time between San Francisco and New York and to the time required to file and transmit the message after the close of the ceremonies at the Exposition. However, the last form was closed by midnight and complete copies of the issue began to come from the bindery at about 10 o'clock on Saturday morning, practically according to normal schedule. While our readers undoubtedly missed the

dailies there were some compensating advantages accruing from the use of this year's plan. It permitted an ideal arrangement of the reports of society proceedings in the order of occurrence, and the featuring of some of the leading papers in a style more nearly commensurate with their importance than under the plan of previous years. Moreover, the facilities of the ELECTRIC RAILWAY JOURNAL'S own printing office, one of the largest and most complete plants in appointments in New York, were at its disposal. It was a great pleasure to be able to give our readers genuine newspaper service and there is evidence that it was appreciated, thus justifying the effort and expense.

PUBLIC INTEREST IN SURPLUS

The testimony in the recent Interstate Commerce Commission investigation of the Rock Island mismanagement appears to bring out the idea that the public should have no interest in the disposition of net corporate income or surplus so long as rates are reasonable. To our minds this attitude deserves the censure bestowed upon it by the commission. While nominally the surplus belongs to the stockholders and the public has no concern in its disposition so long as such is made legitimately, an indirect public interest does cling to the surplus in that any dissipation of it is almost certain to work harm to the railway factors in which the public is directly interested. As the commission states, if the funds derived from transportation services are expended wastefully or corruptly, the inevitable result must be either increased rates, in order to enable the company to obtain money to pay operating expenses, or bankruptcy.

To critics of this view it seems absurd to imagine that the rates of the Rock Island, for example, are higher because somehow or other the bottom was kicked out of the company's treasury, but they miss the point. We shall take no time to argue whether or not these particular rates are higher on this account, but the real issue, and the only one in which we are concerned, is that with the condemned system of management, they would have to be raised sooner or later, and the public, knowing of this eventuality, has a right to be concerned in all practices that would, from its point of view, result in an adverse effect upon the existing rates.

It can hardly be denied that the analysis of the theory of railroad rates begins with a study of railroad expenditures, and the honesty that is shown by a management in handling its surplus account is a fair criterion of its general honesty. If it misuses the surplus account, it would feel no qualms of conscience in skimping maintenance, paying excessive salaries and otherwise depreciating the property and pinching the stockholders, and in time the officials would be obliged to plead for higher rates to cover their misdeeds or else submit to bankruptcy or a complete reorganization. When property, service and rates are thus threatened, it cannot truthfully be said that the public must look on unconcerned. At present rates are fixed to pay a reasonable return on the fair value of property used

by the public. Railway officials have no right to misuse the portion of this reasonable return left after fixed charges so as to restrict the company's earning power and make the whole rate of return seem inadequate.

THE TIME LOST IN MAKING STOPS

With the impetus that has been given to consideration of the influence of stops per mile on schedule speed by the remarkably comprehensive report presented by the committee on schedules and time-tables to the Transportation & Traffic Association at San Francisco, it might be pertinent to call attention to one factor that may be overlooked in discussions of the subject. This is that the time involved by a stop includes not only the interval during which the car is stationary, but also the losses due to slowing down before the stop and to accelerating afterward. These losses frequently amount to more than the actual time that the car remains stationary, and the fact should be clearly specified in case it is intended that they are to be left out of consideration.

It is probable that the extent of the acceleration and braking periods has been frequently underestimated in the past, as some authorities have vehemently asserted that elimination of stops could have only a slight effect upon schedule speed in city service, this fallacy clearly arising from a failure to comprehend that a stop involves more than the time lost in standing still. But as a matter of fact, the braking and acceleration losses are subject to close approximation by calculation and they are much more constant in amount than most of the other units entering into transportation problems. For their determination it is necessary only to arrive at the "average non-stop speed" of a car on the route under consideration and then to apply the elementary formulas of mass acceleration, using the known rates that are established by the capacity of the motors and of the brakes.

The "average non-stop speed" is a figure that may be approximately described as the speed at which a car could be run over the route behind a long gap in the schedule and without accepting passengers, thereby avoiding all passenger stops but subject to the usual vehicular interference. It is materially less than the maximum speed of the car, because on any city route there are of necessity many slow-downs due to various causes other than passenger stops, and while these slow-downs are irregular in number their average is fairly constant and may be well established on any particular route. City cars, for instance, are quite frequently geared for a maximum speed of 20 m.p.h. on level track, but the average non-stop speed for large cities is very generally somewhat less than 15 m.p.h. The difference is inevitable, but that it is reasonably constant under any given set of conditions is easily demonstrable.

For example, on five routes of a certain large city system the schedule speeds were found to range from 7.2 m.p.h. to 9.4 m.p.h., the schedules being generally considered to be easy, and the average number of stops per mile was found to range from 14.4 to 7.7. Allowing for a fifteen-second loss at each stop and deducting the

resulting time loss per mile on each route from the respective schedule time per mile, there is provided a basis for estimating the non-stop speed for each route, and this works out at a figure that ranges from 12.2 m.p.h. to 13.8 m.p.h., giving a variation of only 6 per cent above and below the mean. So small a variation from a constant figure for the non-stop speed in this city is significant in view of the widely different conditions with regard to stops and schedule speeds that existed on the five routes under consideration, the speeds varying more than 13 per cent from the mean figure and the stops per mile no less than 30 per cent.

Once that the average non-stop speed on any route is determined by trial or estimate—the latter being really accurate enough for all ordinary purposes—the calculation of the time lost in retardation and acceleration becomes simple. Assuming, for example, a braking power that provides retardation at the frequently used figures of 2 m.p.h.p.s. and an average non-stop speed of 15 m.p.h., the operation of bringing the car to a stop will require 7.5 seconds, during which time the car will travel 82.5 ft., according to the old formula to the effect that distance equals one-half the rate of acceleration multiplied by the square of the time interval.

If the brakes had not been applied, however, and the car had continued to move at a speed of 15 m.p.h., this distance of 82.5 ft. would have been covered in 3.75 seconds, instead of the 7.5 seconds that were actually used up during the braking period. In consequence the loss in time due to braking would be the difference between the two figures, or 3.75 seconds. By the same method it may be determined that an acceleration of 1.5 m.p.h.p.s. would cause a loss of five seconds, so that the total loss due to both braking and acceleration would be 8.75 seconds. This loss, added to the average space of time that elapses while the car is actually stationary at a stopping point, or, say, seven seconds, gives a total loss of some fifteen seconds per stop, and this figure will be found to be not far from a general average in any city service.

Of course, a car does not, literally speaking, approach every stop at the average non-stop speed. Frequently the presence of a wagon on the rails just ahead of the car will involve a dragging stop from a speed of 5 m.p.h. or even less. But on the other hand this is offset by the cases wherein the car has a clear street ahead of it and also by the fact that acceleration in the majority of instances is carried to a speed materially exceeding the average that is permitted by the interference of vehicular traffic.

On this basis, then, the savings in time effected by eliminating stops on any particular route may be at least approximated, and as indicated by the foregoing figures, the saving will be important even when the average time devoted to passenger interchange at each stop is at the absolute minimum. When, however, this interchange time amounts to seven seconds or more, as is frequently the case, and the additional time loss due to acceleration and braking makes the total loss at each stop average some fifteen seconds, the stops may actually involve the expenditure of about as much time as

is devoted to getting the car over the road. Twelve stops per mile, to be specific, will produce a time loss of three minutes per mile, and even under favorable conditions will set a practical limit of 8.5 m.p.h. for the schedule speed. The elimination, however, of six of the stops will cut the time loss to 1.5 minutes and, under similar conditions, will raise the limit for the schedule speed to 11 m.p.h.—an increase of 30 per cent.

A UNIVERSAL CAR

If the latest car of the Bay State Street Railway had nothing more to commend it than its mechanical ingenuities it would still be a remarkably fine example of car design. But the designer had bigger things in view than to make a stanchion form part of the conduit system or to cast a motor nose integral with the magnet frame at its center of weight. In brief, the car has been designed from the standpoint of the progressive operator rather than from the standpoint of the equipment man alone.

During the past three or four years the industry has been favored with some very radical departures in car design, all to the end of securing lower floors and easier boarding facilities. The Bay State car attains the same desirable ends while holding to the standard car outlines, and public criticism of freakishness is avoided. The blend of old and new practices appears most prominently in the access and fare collection features. Ordinarily the car will be operated as a modern fully-vestibuled, non-bulkhead car; but when winter or other special conditions demand it, bulkhead doors may be withdrawn from pockets which do not project even to the outer line of the corner seats. As for fare collection, prepayment with a platform fare box is the rule for one-fare operation, and inside collection with a register for multi-fare operation, and both of these conditions have been provided for.

Another aspect of accessibility appears in the pneumatic door and step control which is operative from any part of the car. This is an excellent feature. Motor-men and conductors who have to open and close heavy doors several hundred times a day become too sluggish to do quick work; and in any event the mind of one should be concentrated on the road ahead and of the other on the collection of fares. Many a fare is overlooked and many a precious second wasted when the conductor has to tug at heavy, clumsy door and step mechanisms. In addition, the possibilities of modern steel-car construction have been splendidly exploited in an arrangement of sash that really does make the same car equally agreeable for winter or summer, and in a width of seat rarely found except in steam railroad cars.

Manifestly, the Bay State car has been designed to meet a wide range of operating conditions. In fact, its congeries of metropolis, cities, towns, villages and wide stretches of open country served by means of 1000 miles of track is matched by hardly any other system in the country, and a design so adaptable to practically every class of service and to every brand of climate may well be characterized as universal.

Bay State Combination Car

New Car for All-the-Year-Round Service on Both City and Suburban Lines Has Been Built by the Bay State Street Railway, Special Regard Having Been Given to Convertibility, Accessibility, Convenience and Safety of Operation—This Article Describes the Body Equipment

The Bay State Street Railway, Boston, Mass., has recently completed a convertible car embodying many novel features of design and representing in many respects a noteworthy advance in practice. The new design is the outcome of several years' study of the varied service conditions on the system and exhaustive comparisons of rolling stock designs in different parts of the country, and special recognition was accorded to the importance of the following desiderata: Accessibility, convenience and general appearance from the standpoint of the traveling public; safety in operation; convenience for the operating crews; adaptability to all-the-year-round service; economy in use, and suitability to the company's present and future needs.

The new car was designed by E. W. Holst, superintendent of equipment Bay State Street Railway, and was built at the works of the Laconia Car Company under the immediate supervision of the railway's equipment department. The general dimensions are shown in the following table:

Length of body	30 ft. 6 in.
Length over bumpers	42 ft. 9 in.
Width over side plates	8 ft. 2 in.
Height, rail to trolley base	11 ft. 6 in.
Seating capacity	44 to 47
Height, rail to first step	13 in.
Height, second step	12½ in.
Height, platform to door sill	9½ in.
Diameter of wheels	30 in.
Truck centers	20 ft.
Weight, completely equipped	40,970 lb.

NEEDS OF PASSENGERS FIRST CONSIDERATION

Accessibility is one of the main features of the design. The vestibules are built with a clear door opening of 3 ft. ½ in., and the first step is only 13 in. high or 3 in. nearer the rail than in previous Bay State cars. The car has a width of 6 ft. 3 in. over vestibule corner posts, and the elimination of the ordinary wooden folding-door construction for the motorman's inclosure gives a liberal area within the vestibule which may be traversed or occupied by passengers. From the rail to

the vestibule floor is only 25½ in., and the 9½ in. rise from the platform to the door sill is easily negotiated.

The side view of the car illustrated on this page shows the size of window opening to be so liberal that the body of a seated passenger is visible to the knees.

BAY STATE CAR—CROSS-SECTION
SHOWING SIDE SHEATHING AND
WINDOW ARRANGEMENT

The suitability of the car for open service is therefore self-evident. The front corner view, shown on page 856, displays the liberal length of grab handles, 2 ft. each, and the unusually large signing facilities, as well as the steps folded beneath the vestibule door well within its vertical plane.

FARE COLLECTION

The arrangement of the fare box is shown in the two illustrations at the top of page 855. In one of these the box is in position ready for prepayment service, and in the other it is pushed up out of the way into the monitor extension. The box is equipped with an International register. It records dimes, nickels and pennies, and slides up and down on a white-enamelled 1¾-in. steel tube that is provided with a ¼-in. slot. The register is carried on a saddle extending through the slot

BAY STATE CAR—GENERAL VIEW SHOWING THE EXTENDED MONITOR OVER THE VESTIBULE; WINDOWS REMOVED FROM THE REAR HALF OF THE CAR

BAY STATE CAR—VIEW SHOWING FARE BOX LOWERED INTO OPERATING POSITION

BAY STATE CAR—FARE BOX CONCEALED IN ROOF MONITOR. HEATER UNDER THRESHOLD

to a plunger about 11 in. long, the inside of the tube being lubricated. In the monitor extension is a specially designed spring counterbalances for the weight of the fare box on the tube runway.

The register saddle is of pressed steel and it is equipped with a lug for padlocking the fare box. When lowered the register locks automatically in place. At the top and bottom of the vertical rod the register locks into place with a spring catch that may be released by hand.

This arrangement greatly facilitates the use of the car on lines in which hand collection of fares may be in effect, or in interurban service that involves the collection of fares at fixed points or the collection of a

large number of fares at a certain limit, followed by extended operation without the prepayment feature. The rod supporting the fare box is also utilized as a grab handle.

Within the car a new and compact design of fare and transfer register is in service. the equipment being mounted against the head of the bulkhead, as shown in the view on this page. These units are also of International design and are each only $5\frac{1}{2}$ in. square and 8 in. high. The figure displays, however, are full-sized, as in previous larger registers.

A view on this page also shows the motorman's curtained compartment, which has a frame of $\frac{1}{2}$ -in. tubing.

BAY STATE CAR—VIEW SHOWING PIPE FRAMING FOR MOTORMAN'S CAB FOLDED OUT OF THE WAY

BAY STATE CAR—VESTIBULE SEAT FOLDED. MOTORMAN'S CURTAINS AND FARE REGISTER

Directly behind the motorman the curtain is carried to within 2 ft. of the floor, the diagonal curtains on either side being 12 in. shorter. The tube framing affords an extremely light and convenient means of throwing a cab into service, and it is designed to fold against the oblique sides of the vestibule. This arrangement adds to the comfort of the motorman in both summer and winter by reason of the improved ventilation secured at his working position and it enables him to gain instant privacy with ease.

The vestibules are each provided with two folding wooden seats holding three persons each. There is a clearance of 3 in. between the back edge of each seat and the door framing, virtually giving a 10-in. width for occupancy by the passenger. When the vestibule seat is not in use, it is turned flat, the front end of the seat being hinged to a folding bracket that effects the change in position with the minimum amount of radial movement inside the vestibule, the bracket being equipped with a spring which tends to hold the seat in a flat position against the door frame when not lowered. When lowered, the seat drops into place with a slot at

Consolidated Car Heating Company, Albany. A wire basket for holding signal flags is mounted on the vestibule door header, and in place of the usual card regulating smoking, a reversible "Limited Smoking" and "No Smoking" sign is provided. The shape of the brackets enables the sign to be reversed by a single lifting movement of the hand, avoiding the delay and "thumbing" so often encountered in the reversal of card signs tightly banked against a close-fitting frame.

NEW IDEAS IN LEGIBLE SIGN ARRANGEMENT

Extra sign spaces are provided at each side of the destination sign in the vestibule hood, for use in connection with special car or other temporary service. The letters on the route signs are 6 in. high. All the signs are of Hunter make, the side signs being illuminated by the regular lamps employed in interior car lighting. The extra sign panels in the vestibule hood are each equipped with a shutter revolving on a horizontal axis, so that when the sign is not in use, all the light from a sign lamp mounted in the center of the compartment behind the destination panel passes

BAY STATE CAR—FRONT VIEW OF THE CAR AND GENERAL VIEW OF THE INTERIOR, SHOWING LOW WINDOW SILLS AND TRIPLE SASH WINDOWS

the free end fitting the vertical tubing that serves as a hand rail at the inside edge of the bulkhead.

The operating handles used by the motorman are arranged within easy reach of his seated and standing positions. These include, in addition to the master controller, hand-brake wheel and air-brake valve, a combination switch for the arc and incandescent headlight, whistle cord, sander control, destination sign handle and door-operating handles. The lighting, heating, air-brake and circuit-breaker switches are mounted in the vestibule near the ceiling.

Each pair of vestibule doors is opened and closed by a pneumatic engine mounted in the upper part of the vestibule above the doors and in a compartment fitting closely under the bonnet. The valves are controlled by horizontal rods with lever handles inside the car body proper and by wirepull rods located above the motorman and conductor in the vestibules. Any pair of doors can be opened from either vestibule. Ball bearings are used in the bulkhead doors and in the brackets of the vestibule doors. The door-operating engines on one side were built by the Burdett-Rowntree Manufacturing Company, Chicago, and those on the other by the

through the latter. When the shutter is opened the flux then divides between the signs without noticeably decreasing the legibility of the front indication.

The sign frame forms part of the car framing, as a gusset extending upward from the post in the vestibule front ties the latter into the frame, the post being cut off at the overhead compartment.

The car interior is lighted by 56-watt lamps mounted in "Holophane" reflectors, the general lighting following the company's practice as described in the *ELECTRIC RAILWAY JOURNAL* of Sept. 28, 1912, and Sept. 27, 1913. Seven interior lamps are used, mounted in the center of the monitor, and in the vestibule an additional lamp with reflector is mounted below the ceiling over each door and providing flood-lighting at the steps. The air gages in the vestibules are each equipped with a hooded incandescent lamp of low power, supplied from the trolley circuit through resistance.

The thresholds are provided with safety treads of "Aero" metal. This metal is also used for all interior fittings. The space beneath the threshold is made available for the installation of two truss-plank electric heaters for vestibule service, perforated covers

being provided on the riser. The threshold is $8\frac{1}{4}$ in. wide and the ramp leading into the car has a rise of 2 in. in a distance of 5 ft., making both ascent and descent scarcely noticeable. Vertical tubes at the inner edges of the bulkheads are used as combination grab handles, as stiffeners for the bulkhead framing and as electric conduits.

SEATS EQUIVALENT TO STEAM RAILROAD WIDTH

The seats were made by Heywood Brothers & Wakefield Company to the railway's special design, the twelve cross-seats being mounted on pedestals spaced on $29\frac{3}{4}$ -in. centers. The width of these seats is 16 in., and the spacing gives extra room for the passenger's knees and for hand baggage. As the pedestals are set somewhat close to the aisle, a footrest 23 in. long is made possible, also affording increased comfort. Again, between the cross-seats and the longitudinal seats a space of 11 in. is provided as compared with ordinary practice of 8 in. or 9 in. The longitudinal seats are 7 ft. long and 16 in. wide.

BAY STATE CAR—SIGN BOXES AND SWITCHES ON HEADER OVER MOTORMAN'S COMPARTMENT

The cross-seat backs are of cane, tapered at the lower portion of the back and formed around a $\frac{3}{4}$ -in. x 4-in. hardwood back frame. This method of recessing provides an extra inch on each side of the lower part of the seat back, adding to the comfort of the rider in the seat and affording additional knee space as well. The cross-seats are 32 in. long, and as the window ledges are not carried above the seat level the full width of the seat is available. The car sides extend but $17\frac{1}{2}$ in. above the floor and allow one overhang of 6 in. at the window sill and 4 in. over the aisle. The total length of seating space figures 42 in. or enough for three persons to the seat in a pinch.

OTHER DETAILS, INCLUDING VENTILATION

The upper windows, 49 in. x 24 in., are permanently fixed. They are built into one frame, the rails being gained into the posts under the post cap, to form a longitudinal reinforcement in the framing of the superstructure. This takes the place of the usual wide letterboard. On each side of the car are four sections of electrically welded screens extending $20\frac{1}{2}$ in. above the window seats. The window pockets are wide enough

to permit the emergency installation of a 7-in. x 24-in. cold-weather sash, this sash being capped by an arm rest screwed into the sides of the posts. The lower movable sashes, each 18 in. x 24 in., are interchangeable and can be lowered into the window pocket when released by eccentric catches.

At the bottom of each window pocket are two rubber stops $\frac{1}{2}$ in. thick, bolted to plates covering handholes on the under side of the side framing, which can be quickly removed for cleaning. The window pockets are $22\frac{1}{2}$ in. deep below the sill and are $2\frac{3}{4}$ in. wide inside. The sashes are $\frac{5}{8}$ in. thick. The arrangement enables the windows to be left open at the top and bottom; open at the top only; at the bottom only, giving a protection of shoulder height; and in winter with cold-weather sash in place, a $10\frac{1}{2}$ -in. opening can be obtained.

A Barrett jack of special design for oblique application up to 45 deg. is housed with two wedging blocks in a compartment below one of the longitudinal seats. At the further end of the seat is a compartment for the crew's wearing apparel, lost articles, etc. It is lined

BAY STATE CAR—COMPARTMENTS FOR JACK, WEDGING BLOCKS AND CREW'S WEARING APPAREL UNDER SEAT

with galvanized iron, which can be removed for cleaning, and which is provided with $\frac{1}{2}$ -in. holes for draining out of doors. Panel heaters in front of the compartment hasten drying.

Under another long seat are two compartments for sand. The forward compartment is provided with a spout leading to the wheel, the latter merely providing extra storage capacity. Electric heaters in front insure dryness. Under one of the longitudinal seats, also, are mounted a magnetic switch and a supply switch for the heater system, which is of the Consolidated type, with two circuits of twelve units each. Thermostatic control is provided and all heating units are interchangeable.

The ventilation system is unique in its combination of the usual monitor sash, of "Automatic" ventilators (also in the monitor) and of special ventilators placed in the vestibule ends of the monitor. These are built as balanced sash, acting as outlets or inlets according to speed conditions. The equipment also includes Rico sanitary straps, Kilbourne sanders and Wilson trolley catchers.

The second article will treat the framing, motors and control of this car.

Notes on Mountain Railway Electrification

A Comparison of Effective Grade Reduction by Lengthening Grades and by Electrification, and a Study of Electrification Possibilities, Theoretical and Practical

BY F. CASTIGLIONI, NEW YORK

In a recently published book describing the construction of the Grand Trunk Pacific Railroad* the writer described the successful efforts of the engineers to avoid the use of grades greater than 0.4 per cent and curves sharper than 4 deg. This was done to produce a high-efficiency line, the efficiency being limited by the ruling grade. In this case the grades were kept within limits by lengthening the line as necessary. The Canadian Pacific Railway spent \$1,250,000 in doubling the length of the "big hill" which lies between Hector and Field in the Kicking Horse Pass. These illustrations are cited to show to what great lengths steam railroad companies will go to keep down the grades and will serve as a point of departure in discussing the relation of electrification to mountain railway work.

It will be shown that for electric railways the limits of low gradient can be made higher than for steam railroads, which means that under the same satisfactory conditions of operation an important saving can be effected in the first cost of the line, as a consequence of the fact that steeper grades in mountain railroads may often mean either a shortening of the route or the choice of a cheaper right of way.

MECHANICS OF MOUNTAIN TRACTION WITH REFERENCE TO COST OF ROAD

To illustrate some of the problems involved in crossing mountain ranges let us assume that the terminals of a mountain division of a railroad are 100 miles apart, that they are at the same elevation, that there is a mountain ridge between them, that the summit of the pass over which the road must run is midway between termini and 2640 ft. above them, and that the grade is uniform. The grade will then be 1 per cent and there will be 50 miles of line on each side. Next assume that an alternate design providing for 0.5 per cent grade is prepared, necessitating the lengthening of the line on each side to 100 miles. Then the relative amounts of energy necessary to reach the summit in the two cases will be, assuming 8 lb. per ton friction, 7,392,000 ft.-lb. per train ton for the 1 per cent grade and 9,504,000 ft.-lb. for the 0.5 per cent grade.

It should be noted that the reduction of the average grade from 1 per cent to 0.5 per cent means not only an increase of 28 per cent in the energy necessary to reach the summit, but also a nearly double construction cost corresponding to the doubled length of the line.

A further remark is that the easier grade is more likely to compel the adoption of helicoidal approach tunnels, such as are encountered in the Simplon and Gothard lines, which tunnels are costly undertakings for the scant gain of about 100 ft. in elevation which they afford.

Looking at this problem from another point of view, there might be the case that, with the same length of the roads, the solution with 1 per cent grade offers the possibility greatly to reduce the length, or entirely to abolish the long summit tunnel that is necessary for the solution with 0.5 per cent grade. With 8 lb. per ton resistance, 147,840 ft.-lb. per mile of track are required on a 1 per cent grade and 95,040 ft.-lb. are required on a 0.5 per cent grade, an increase of but

about 55 per cent in energy which might well be compensated by the decreased interest charges.

The great cost of reducing grades emphasizes the advantage of electrification of the heavy grades instead of lengthening the line to reduce them. The electric locomotive is particularly adapted to steep grades, especially if part of the energy consumed in climbing the grade can be restored to the line in descending it. The advantages of electrification are greater the higher the grade, not only on account of the larger possible saving from regeneration but also because, with a given resistance, the amount of energy required to climb the grade is less than proportional to the grade.

THEORETICAL POSSIBILITIES OF ENERGY REGENERATION

Taking up more in detail the matter of regeneration, the possibilities of this can be seen more clearly by means of a few simple calculations. The efficiency of regeneration may be taken at 80 per cent at the locomotive so that after deducting from the tractive effort due to the grade the tractive effort lost in friction, 80 per cent of the balance will be available for restoring power to the line. Fig. 1 shows the average tractive effort up and down hill with different grades and with regeneration under the above-mentioned conditions. Fig. 2 shows the ratio of the regenerated to the necessary tractive effort over the same range of grade. The effect of the grade-reducing qualities of regeneration is clearly brought out in these figures. These results, of course, will be obtained only when all of the regenerated energy can be utilized locally. If the energy must be transmitted to any considerable distance line losses will reduce the saving. The calculations show the theoretical maximum saving.

As a grade of less than 0.5 per cent was taken as the standard in the Grand Trunk Pacific case, it will be of interest to compare the tractive efforts required on different grades with that corresponding to one-half of 1 per cent grade. The calculations for this comparison are shown in the accompanying table and the results are plotted in Fig. 3. The ratios given represent also the increase in the length of an incline of one-half of 1 per cent grade necessary to cause the same total energy consumption for up and down travel as is required on the corresponding grade of the original length. For instance, the same amount of energy would be expended for the round trip on 10 miles of 3 per cent grade as on 15.56 miles of 0.5 per cent grade.

These calculations give weight to the assertion that the steepness of the grade and the elevation of the summit are much less important if regenerative electrification is adopted, and indicates that it may pay to take a railroad over a hill rather than to adopt a circuitous route around it.

Coming now to the practical side of operation it needs no argument to show that the electric locomotive has been commercially developed so that its use is entirely practicable on mountain divisions of steam railroads. It has not only shown better overload capacity than the steam locomotive, but it can take care of overloads without warning much better than can its steam competitor. Electrifications, such as those completed or contemplated, involve special divisions with their own locomotive requirements whether steam or electric

*"The Making of a Great Canadian Railway," by Frederick A. Talbot, published by Seely, Service & Company, Ltd., London.

locomotives are used. While it would be desirable to have one locomotive that would be satisfactory on heavy grades and level track, this is not a necessary requirement. With electric locomotives in many cases, the only difference between the locomotives on the plain and mountain divisions would be a difference in gear ratio.

RESULTS ACHIEVED WITH THREE-PHASE ELECTRIFICATIONS

For regenerative purposes the system par excellence is, of course, the three-phase one. Withholding for the present any judgment as to the regenerative qualities of the single-phase system now being tried out in this country and the regenerative direct-current system soon to be tried out in practice, it will suffice to refer to the simple three-phase system in which regeneration is an inherent and automatic quality.

Although the three-phase system has been one of the main contestants in the "battle of the systems" and has made a fine record, it has not been advertised as much as the older systems. Pending the development of the universal system of electrification we must for the present be contented with selecting the right system for the right place. Some of the facts regarding the achievements of the three-phase system in mountain work are worthy of consideration.

In an article printed in the issue of the ELECTRIC RAILWAY JOURNAL for March 6, 1915, by G. Pontecorvo, it was stated that the Italian three-phase electrification comprised 417 miles of track in operation or being electrified, 300,000 hp. in locomotive capacity, grades of 3 per cent and 3½ per cent, locomotives of 2000-hp. capacity, regeneration up to 54½ per cent, etc. In addition to the technical data given in Mr. Pontecorvo's article there are other facts

which must be kept in mind. In comparing the mileage and total capacity of the three-phase system in Italy with that of other systems the difficulty experienced in securing the necessary capital must be considered, as the Italian railways do not earn enough to permit the paying of a reasonable rate of interest.

Furthermore, the three-phase system was selected in Italy by the railroad engineers primarily to fit the requirements which they regarded as being of foremost importance, namely, ruggedness of rolling stock and energy recuperative ability. It was difficult to secure the co-operation of manufacturers in developing the system. Again there is a great deal of objection to the use of the double overhead contact line, but in Italy the double overhead line has given no trouble. Some engineers in America have suggested that the voltage of 3000 used on the Italian railways was the limiting voltage, but that this is not the case was demonstrated by F. Spinetti in the *Bollettino del C.N.Ing Ferroviari*. He shows that the working potential between overhead wires is limited only by the reliability of the transverse insulating bridges at the overhead switches, which, following the construction adopted in Italy, is related to the distance between the current collecting devices of the locomotives. Figures are given to demonstrate that a comparatively small increase of this distance, to be obtained with somewhat larger locomotives, would allow the adoption of 8000 to 12,000 volts as a safe working potential, with corresponding improved efficiency of the motor to work directly on this voltage without need of interposed transformers. The operation of the Cascade Tunnel electrification on the Great Northern Railway demonstrates that the three-phase system is not impossible under American conditions.

It is true that in the electrifi-

cation described by Mr. Pontecorvo the amount of regenerated energy at the power house is only 14 per cent of the total under a given schedule, but it is also true that the Italian electrifications are on short sections of road, scattered in such a way as to render difficult the adoption of such schedules as will prevent the waste of regenerated energy in the power-house rheostats. This loss would be eliminated in a system with a sufficiently large and diversified load.

CONCLUSION

All of the foregoing is intended not as a criticism of the plan of the Grand Trunk Pacific Railway in adopting a maximum grade of one-half of 1 per cent, but merely to emphasize the point that regenerative electric traction may offer means for the adoption of certain routes which, from the viewpoint of mountain steam railroad-ing, would be condemned *a priori*. This is of importance in creating the new means of communication which the increased traffic demands, in spite of the fact that the best routes are already occupied.

It seems therefore advisable that, in studying new projects of mountain railroads, the alternative scheme of "electric traction from the start" be carefully considered, because it not only can offer all of the operating advantages of steam traction, but also can show new advantageous solutions and considerable savings in the construction of the road.

Municipal Tramways Association Conference

The annual conference of the Municipal Tramways Association, which was held in London, England, on Sept. 23-24, was of a decidedly curtailed character owing to the war. There were no entertainments of any description. Two papers were presented, one of which, entitled "Tramways During War Times," was by James Dalrymple of the Glasgow Corporation Tramways. In this the author outlined the immediate effects of the war upon the working force of the railway, stating that it was impossible to obtain skilled workmen for the repair shops, and that the total working force had been very materially reduced in all departments. In regard to wages the majority of the shop employees had either received increases agreed upon between the masters and the men in each particular trade, or else had been paid a war bonus of 50 cents per week by the corporation.

The reduction in force had been particularly marked in the platform men, and while the railway was still taking on as many men as could be employed, there were more than 800 women conductors in service and still more of them were being engaged. The regular course of training for the women extended over eight days and they had been found to be very quick in picking up their duties. The women received the same pay as the men and had the same working hours, duties and reliefs, no difference whatever being made between conditions under which each sex was working, except that women were not asked to learn to operate the cars and were very rarely asked to work seven days in one week. Women conductors, he said, were now working on all routes of the Glasgow system. Some routes were very much quieter and more respectable than others, but it was found that even on the toughest routes the influence of the women conductors was all for good. They appeared to be able to handle an unruly passenger quite as firmly and perhaps more successfully than a man.

Mr. Dalrymple's paper provoked an extended discussion in which practically every phase of the question of women conductors was considered. The consensus of opinion was that the experiment of employing women in this capacity had been quite a success. At the conclu-

sion a resolution was passed to the effect that the Municipal Tramways Association urge the removal of any of the present restrictions as to the employment of women as street car conductors in the metropolitan area of London.

The second paper to be presented, entitled "Financial Problems," was read by Alfred Baker of the Birmingham Corporation Tramways. He cited experiences with an increase in fares during the later days of the war, these increases ranging from 25 per cent to 33 per cent with an abandonment of the workmen's reduced fares. The public expressed no objection to the change, which resulted in an increase in receipts from about 23 cents per car-mile to 26 cents per car-mile. In the discussion opinions of very divided character were expressed regarding the advisability of increased fares, a number of delegates believing that there was material danger of decreased gross receipts with general increases in the fares that were charged.

State Railways Win Pageant Prize

During the recent State fair week in Syracuse, N. Y., an automobile pageant was held and the New York State Railways received a silver cup for the most attractive float entered. The cup and float are illustrated herewith.

SYRACUSE PAGEANT CUP

The float was designed and constructed under the personal supervision of F. L. Hinman, master mechanic of the company. It was made exactly five-eighths of the size of the company's standard pay-as-you-enter car and reproduced this car to the minutest detail. It was illuminated exactly like an actual car and was provided with miniature coupler, trolley catcher, headlight, fenders, signs, trolley pole, etc. The car was covered with white, yellow and maroon paper flowers.

One feature of the float which was especially successful was the representation of the spark caused by the contact of the wheel with the trolley wire, by means of two small green lamps placed on the top of the trolley wheel. When these lamps were lighted they imitated the spark very successfully.

FLOAT SHOWN BY NEW YORK STATE RAILWAYS IN SYRACUSE STATE FAIR AUTO PAGEANT

The pageant in which this float was shown was viewed by approximately 60,000 people and the company received some very desirable advertising, especially in view of the fact that it succeeded in capturing the cup.

Municipal Co-operation in Utility Management*

Four Theories of Municipal Co-operation in Private Utility Management are Described and Illustrated—Building of Extensions is Fertile Field for Co-operation—Diversion of Gross Earnings for Municipal Purposes is Unjust

BY P. J. KEALY, COMPANY MEMBER KANSAS CITY (MO.) RAILWAYS BOARD OF CONTROL

The franchises under which early public utilities were promoted, constructed and operated were generally granted on easy terms and contained many loose provisions, the chief interest of communities at that time being to make certain that the investment would be undertaken and the service furnished. Because of this viewpoint, competition and duplication were encouraged in every possible manner and franchises were indiscriminately granted to all comers. While in many of the Eastern states perpetual franchises were granted, in the majority of states these public utility grants were limited by statute to periods of from twenty to forty years. In recent years, therefore, owing to the expiration of a large number of these older franchises, the mutual relations existing between the public utility and the community have received deep consideration.

Within the last decade a clearer and better-defined understanding of the entire situation has been brought about. The owners of the utilities more than ever realize that it is necessary for them to accord the best service to the public, and that public confidence and satisfaction are the greatest assets of any public service company. On the other hand, careful and disinterested studies have proved that public utilities as a whole are not so profitable as the public has been led to believe was the case, and that municipalities must show liberal treatment to the private companies, that they may continue to attract the additional capital necessary to meet the increasing demands for service.

REGULATED MONOPOLIES

Perhaps the foremost advancement in either state or municipal co-operation in public utility management is the recognition of the fact that competition within the same community generally results in an economic waste without improved service. The National Civic Federation's committee on public ownership in a report made some time ago stated: "Public utilities, whether under public or private ownership, are best conducted under a system of regulatory and legalized monopoly." This theory has been recognized in practically every state public utility law, most of which provide that before a competitive utility can be operated a certificate of convenience or necessity must be approved by the commission. In several of the states this even applies to the installation of municipal plants, and in many instances the desire of municipalities to enter into the public utility business has been refused by the state commission on the grounds that there already existed within the municipality a privately-owned utility of sufficient size to meet the existing demands for service.

The present tendency, as reflected in most of the more modern franchises, is toward recognizing that the interests of the community and the private company furnishing public service to that community are identical and that the interests of each can be best served by mutual and concerted action. No public service commission act yet passed, however, provides for as much detailed participation in or supervision of the affairs of a private company as is essential to the successful opera-

tion of a partnership management. Where the city is interested in other than the mere standard of service required, therefore, a closer participation in the company's business is necessary than that which public service commissions can generally exercise under their enabling acts.

EXTENT OF MUNICIPAL CO-OPERATION

There have been a number of important franchises granted within the last eight or nine years, in which the trend or extent of municipal co-operation is well illustrated. Several different theories, all purporting to reach the same end, have been used, the more important of which are as follows:

1. That the company be permitted a fixed return, if earned, upon an agreed valuation, all earnings above this to go to the city or to be used to reduce the rate for service.

2. That the company be permitted a fixed return on an agreed capitalization, the surplus over this to be divided between the public utility and the municipality.

3. That a certain percentage of the gross earnings be paid to the city, the city in addition to supervise and regulate the service.

4. That the sliding scale plan be used.

FIXED RETURN WITH VARIABLE FARE

An example of the first theory is that of the Cleveland traction ordinance, which permitted a return of 6 per cent on an agreed capital value and fixed a rate of fare for service under which it was estimated the earnings would return this per cent to the company. In addition, a reserve fund was created into which the surplus earnings above the amount paid to the company are deposited. When this reserve reaches a fixed maximum, fares are automatically decreased, and when the reserve is depleted to a certain minimum, the fares are automatically raised. In addition, the ordinance provides a fixed amount to be expended for operation as well as for maintenance. The weakness of this theory, as developed in the Cleveland situation, is twofold: (1) The evil exists in this contract that is inherent in any contract which limits the operating company to a fixed per cent of return, in that the incentive to the company toward providing efficient management is thereby utterly lacking; (2) the building of extensions tends to decrease the reserve and increase the rate of fare, for the reason that generally all extensions are development lines and unprofitable during the first few years of their operation.

The electric motor, by making available the cheaper outlying property at the same rates of fare, has done more to solve the question of improper housing conditions and slums than all of the sociological studies, investigations and corrective measures that have been undertaken in this country. Any ordinance provision which tends to limit or discourage extensions, either directly or indirectly, will permanently jeopardize and injure the best interests of the city, and will more than offset any of the meritorious provisions. The very life and vitality of every American city is concerned in developing the outlying property, making possible cheap

*Abstract of a paper read before the American Institute of Electrical Engineers in St. Louis, Mo., on Oct. 19, 1915.

home sites and, by preventing a zone system of fares or rates, avoiding the slum conditions generally found in Europe where such a system is in effect.

FIXED RETURN WITH CITY PARTICIPATION

The second theory is one on which both the Chicago and Kansas City traction settlements were made. The Chicago traction ordinance provides that the company shall be permitted a 5 per cent return upon an agreed capital value and that the surplus earnings above this return shall be divided between the city and the company, 55 per cent to the former and 45 per cent to the latter. The city, through the Board of Supervising Engineers, participates actively in the management of the company, supervising and directing every phase of its operation, such as the routeing and scheduling of cars, the approving of all engineering work, the supervision of contracts and the approval of capital expenditures. The original Chicago ordinance, as passed in 1907, did not provide for the participation of the Board of Supervising Engineers in the operation of the company, its powers under the original ordinance being confined to the approval of capital-account charges and the supervision of all engineering features. The vital interest of the city in proper service was recognized by amending the 1907 ordinance in 1913, so that the board would supervise the routeing and scheduling of cars in addition to the features previously mentioned.

All of these methods of city co-operation were provided for in the Kansas City ordinance, passed in July, 1914. In addition, the Kansas City ordinance goes a step further and provides that not only will the city co-operate in the management through a board similar to the Chicago board, but it will also be represented on the board of directors of the company, five of the eleven directors being appointees of the Mayor. The city will thus not only have representation in the ordinary operating affairs of the company, but will be cognizant of all financial and corporate matters as well.

CITY SUPERVISION WITH PER CENT OF GROSS EARNINGS

The third method of municipal co-operation is, among others, the basis of the Chicago telephone and electric light franchises and of the St. Paul electric light franchise. The Chicago telephone ordinance provides that in addition to 3 per cent of the gross earnings being paid to the city, a telephone inspector is to be selected by the city (but paid for by the company), who will be responsible for supervision of the telephone service. He receives the various complaints and is charged with the responsibility of correcting these as far as he may be able. In addition, the rates are regulated every five years. Similarly, in the electric light franchise a fixed per cent of the gross is paid each year, the rates are regulated at stated intervals and the city electrician exercises supervision over the service at all times.

SLIDING SCALE PLAN

The fourth or sliding-scale method is illustrated in the Boston gas ordinance passed by the Legislature on May 26, 1906. Of all the ordinances passed within the last few years, this is one of the few in which the efficiency of management is recognized. The initial rate of gas was fixed at 90 cents per 1000 cu. ft., which rate permitted a return of 7 per cent on the par value of the capital stock. For each reduction of 1 cent per 1000 cu. ft. made to the consumer the company is allowed an extra dividend of one-fifth of 1 per cent. In other words, at 90 cents per 1000 cu. ft. the company's return is 7 per cent, whereas if it can sell gas at 85 cents the company is allowed an 8 per cent return. An itemized statement of the production, distribution and depreciation expense must be published annually. If the

profit each year is more than 7 per cent and no reduction is made to the consumer, 1 per cent on the par value of the outstanding capital stock is set aside for contingencies or lean years. This reserve is never to exceed one-twentieth of the par value of the stock. In case the surplus in any year exceeds this 1 per cent (8 per cent on the capital stock), and the reserve is equal to one-twentieth of the par value of the stock and no reduction in the price of gas is made to the consumer, the surplus is to be paid to the various municipalities through which the company distributes gas, on the basis of the miles of mains installed in each community.

As to the practical working of this scheme, gas originally sold at 90 cents and then at 85 cents. It is now selling at 80 cents, so that the company is earning 9 per cent dividends. Thus the company has a direct financial incentive in reducing operating expenses in every way, and in providing the most efficient methods of gas production and distribution, since it shares directly with the public the profits of efficient management. According to Louis D. Brandeis, "Boston has reaped from the sliding-scale system far more than cheaper gas and higher security values. It has been proved that a public service corporation may be managed with political honesty and yet successfully and that its head may become a valuable public servant. * * * Gas properties which, throughout the greater part of twenty years, had been the subject of financial and political scandals developing ultimately bitter hostility on the part of the people, are now conducted in a manner so honorable as to deserve and secure the highest public commendation."

LIMITATIONS ON EXTENSIONS

Many of the franchises contain limitations on the extensions to be made from year to year. In St. Paul the electric light franchise, for example, provides that the lines need not be extended to power customers having a demand of less than 2 hp. per day for each 100 ft. of underground conduit extension or each 300 ft. of overhead extension. In the Philadelphia gas agreement, the extensions are likewise limited to the prospective business. Similarly, in the Chicago traction ordinance the construction of a definite number of miles per year was provided. In the Kansas City traction ordinance a minimum of 4 miles of track a year is set, with the added provision that any track which will pay 6 per cent on its cost above operating expenses shall be constructed, and that any trackage constructed and paid for by property owners or other individuals becomes the property of the city and must be operated by the traction company.

BUILDING OF EXTENSIONS BY PRIVATE ASSESSMENT

One of the most fertile fields for co-operation between city and utility is that of assistance in financing the unprofitable extensions (and as previously stated, most extensions are unprofitable), and this not only when privately owned but also when publicly owned. Generally all extensions to municipally-owned water plants are made out of earnings. This can only be possible when the rates to the consumer are too high, for if extensions were considered as a permanent investment and therefore made from borrowed funds instead of from earnings, the present rates could and should be reduced. Furthermore, the building of extensions, whether to a water system, street railway system, electric light system or gas system, has a decided bearing on property values within districts proposed to be served. For instance, the building of street railway extensions generally increases the price of outlying property from \$3 to \$10 a foot. In cases where rapid transportation is found, rents are invariably higher

than in sections of the city where such is not the case. In other words, extensions generally directly benefit the property owner and work to the disadvantage of the rate payer. Hence, if municipal co-operation in public utility management is to exist in the fullest sense and equity is to be shown to the three parties interested, *i.e.*, the operator, the municipality and the rate payer, some method should be devised whereby the cost of unprofitable extensions should be borne at least partly by the property owner who derives the major benefit therefrom. Recognizing this general principle, Cleveland is proposing to build certain track extensions by assessing their cost against the abutting property, while Philadelphia is planning to embark on a rapid transit program costing many millions of dollars, which property owners will pay for in proportion to the benefits received. Several of the larger municipal waterworks systems are considering this manner of providing for the increasing cost of extending their systems. A more general application of this theory would furnish a partial solution of the difficulties experienced by most public utilities in attracting the funds with which to satisfy the ever-increasing demand for service.

INJUSTICE OF DIVERTING GROSS EARNINGS TO MUNICIPAL PURPOSES

Another development regarding the relations between the city and the privately-owned utility, which is constantly finding expression in the most unexpected sources, is the idea that it is unjust to pay any per cent of the gross earnings of a public utility into the municipal treasury. This was one of the provisions most frequently found in the early ordinances, and even in many of those passed within the last few years it has been rigidly insisted upon. It is now generally recognized that such a diversion is unfair to the consumer. The portion of the company's profits that goes into the municipality's coffers and thus is used for the benefit of all of the inhabitants, has been realized only from those citizens using the particular service, and it should, therefore, be expended in perfecting and increasing the service and not in reducing general taxes. "Better service" is the present-day slogan, but as long as a considerable portion of the income of the operating company is diverted to municipal purposes, better service is to that extent handicapped.

For instance, the city of Toronto now receives under an ordinance, passed in 1891, about 20 per cent of the gross earnings of the traction company, which sum amounts to from \$900,000 to \$1,000,000 per annum and forms a very large proportion of the total municipal receipts. Within the last few years the city has made numerous investigations and has tried in diverse ways to bring about a betterment of its street-car service. The amount of money, however, which the city derives from the traction company is secured from giving improper service. At least 50 per cent of the total received by the city from this source goes to reduce the taxes of five large corporations in that city. On the other hand, the additional fixed charges involved in any of the solutions of Toronto's traction problems, as worked out by various engineers, would annually cost not to exceed one-half the amount that is now paid to the city and diverted from the street railway business.

In Chicago a fund of approximately \$15,000,000 has been built up out of the city's share of the traction earnings at the expense of the strap-hanger. The ordinance contemplated that this money should have been expended long since in subway construction and thus reduce the downtown congestion, but for reasons unknown it has not been done.

In promoting the future co-operation of the municipi-

ality in private management, therefore, all profit from the corporation going to the municipality should, as far as practicable, be devoted toward improving the service of the corporation from which it is derived.

KANSAS CITY PLAN OF CO-OPERATION

Of all the contracts that have been passed within the last seven or eight years, perhaps the street railway ordinance adopted on July 7, 1914, in Kansas City provides for municipal co-operation in most detail. The manner in which the municipality will co-operate in the financial, corporate and detailed operation of the property is as follows:

The total agreed capital value is \$30,000,000. On this fixed value it is provided that the company shall be entitled to a 6 per cent return "if and when earned." It is further agreed that before the company participates to any extent in the earnings above the fixed return of 6 per cent, all excess earnings shall be put back into the property until \$7,500,000 of the total value shall have been made good with physical property and the capital account not increased thereby. When this is accomplished the company and the city will divide the surplus earnings above the 6 per cent return in the proportion of \$2 to the city and \$1 to the company. The city is to receive certificates of ownership for the values made good out of earnings. Should the city devote its portion of the surplus toward the purchase of the property, then when one-half of the capital value has been paid the city will take over the ownership of the entire system, subject to a mortgage indebtedness for the other half.

That all these various interests of the city may be properly safeguarded, the contract contains the following general partnership provisions:

1. The company is to be incorporated with a board of eleven directors, five of whom are to be nominated by the city.
2. Those features pertaining to the detailed operation of the road are delegated to a board of control, consisting of two members, one appointed by the company and one by the city, each of equal authority, with provision made for the selection of an arbitrator in case of dispute.
3. Whatever mortgages are placed upon the property must be drawn up in a manner satisfactory to the city counselor and approved by him in writing.
4. An independent audit shall be made annually by the city comptroller of all books, vouchers and expenditures of the company.

Power-Supply Problem in Canada

A recent report issued by the United States Department of Commerce states that plans have been approved by the Hydro-Electric Power Commission of Ontario, and forwarded to the Provincial Government, which will make the commission independent of all private power developments and provide a power supply for many years to come. As outlined by Sir Adam Beck at London several months ago upon the opening of the first hydro-radial car line in the province, the plans called for an initial development of 100,000 hp. by utilizing the maximum head of power on the Niagara River. It is stated that the commission is now facing the end of the present sources of supply, and that the 100,000 hp. supply contracted for with the Ontario Power Company will soon be exhausted by the increasing demands of the municipalities, which even the big increase from the new plant at the Falls and those in the province will not meet. With the advent of rural car lines on an important scale the commission must be in a position to furnish practically unlimited power.

Pennsylvania Railroad's Industrial Trucks

Operating Data and Costs Are Given for Electrically Operated Trucks in Freight Houses, Baggage Rooms and Shops and for Tractor Service for Freight Cars in City Streets

In a paper by T. V. Buckwalter before the Electric Vehicle Association at its convention in Cleveland on Oct. 18-19, the results of the operation of electric trucks on the Pennsylvania Railroad were outlined. The author separated these trucks into three classes, namely, baggage and mail trucks for use in passenger stations, warehouse trucks for freight stations, and shop trucks for railroad shops and general industrial purposes, and in addition he took up the use of electric tractors for moving freight cars over street railway tracks.

Baggage trucks are characterized by a height of platform equal to about two-thirds the height of a baggage-car floor. This works out at about 30 in. The length is controlled generally by existing elevator sizes and ranges from 9 ft. to 12 ft. The width is generally 44 in. A modification of this type has a platform only 9 in. high for use in depressed-track stations where the car floor is but slightly higher than the station platform.

Warehouse trucks are characterized by a platform that is depressed at one end to facilitate loading, the

delivery of the load being made from the end of the truck. The height of the platform is limited to about 10 in. and the width to about 40 in. The over-all length is less than 9 ft. to provide ease of handling.

Shop trucks are subject to a variety of conditions in regard to size and bulk of material handled and this has required a variety of dimensions. A distinct design has not, therefore, been developed, but adaptations have been made of the baggage and warehouse types.

All trucks have been constructed with double-end control, permitting operation with equal facility in either direction and reducing congestion to a minimum. An exception, of course, is made in the case of warehouse trucks, which must have a low frame at one end. Space required to turn is reduced by steering with four wheels instead of two, the operation being made exactly identical in either direction. This eliminates the dangerous practice of running two-wheel-steering trucks backward.

Sufficient traction for all ordinary work is available with a two-wheel drive. The motors are operated at

PENNSYLVANIA ELECTRIC TRUCKS—WAREHOUSE TRUCK FOR COMMISSARY DEPARTMENT

PENNSYLVANIA ELECTRIC TRUCKS—SHOP TRUCK OF STRAIGHT-FRAME CLASS

PENNSYLVANIA ELECTRIC TRUCKS—DROP-FRAME BAGGAGE TRUCK WITH THREE TRAILERS

PENNSYLVANIA ELECTRIC TRUCKS—SHOP TRUCK WITH TRANSVERSE RAILS FOR HANDLING MOUNTED WHEELS

24 volts, this being the minimum at which efficient operation is obtainable. Low voltage for the battery provides distinct advantages, such as a minimum number of cells and a minimum number of connectors, reducing the possibility of connector breakage and reducing the cost and weight per unit of capacity. The capacity is limited to 4000 lb., this being the maximum that can readily and safely be handled within the narrow and congested inclosures at terminals, but a 50 per cent overload capacity has proved desirable.

High speed has been found to be of little or no value for the reason that speed is entirely a matter of condition of the runways and the amount of congestion thereon. The present standard is from 6 m.p.h. to 7 m.p.h. with an empty truck and from 5 m.p.h. to 6 m.p.h. with a load.

The operating data (Table I, page 864) show all charges for the year 1914 for 212 trucks. The table is arranged in two sections devoted to total charges for all trucks at each installation and averages per truck month for each installation. Naturally there is a wide variation in some of the charges, due to the difference in power cost which ranges from $\frac{1}{2}$ cent to 10 cents per kilowatt-hour and to the number of trucks in the installation and character of work done. The figures for shop trucks include labor charges for drivers, but the baggage trucks do not include these charges for the reason that the trucks are driven by baggage porters. However, the figures do not represent the total savings, as the increased efficiency of the shop due to having material handled on a regular and prompt schedule does not admit of calculation.

The saving effected in baggage service is considerable but this is difficult of calculation as the character of the service has changed considerably since the intro-

duction of electric trucks. The labor force has not, generally speaking, been decreased, but on the other hand the business has increased. Rush periods can now be handled without borrowing untrained men from other departments, and a better class of men continue in the service as compared with the rapidly changing force of the old days.

The operating department considers that the most important advantage of the electric baggage truck is

TABLE II—DATA DERIVED FROM TWO AND ONE-HALF YEARS' OPERATION OF ELECTRIC TRACTOR

Cost of tractor	\$13,400
Cost of maintenance and operation	\$13,145
Interest at 6 per cent on \$13,400	2,010
Depreciation, less tires and battery, \$9,200, at 5 per cent	1,150
Depreciation battery, \$3,200, at 25 per cent	2,000
	\$18,205
Total cost of service	\$18,205
Total number of cars (in and out)	22,639
Total cost of service if horses had been used, 22,639 at \$1.86	\$42,108
Saving by electric tractor	\$23,902
Total saving over investment, per cent	178.4
Annual return on investment, per cent	71.4
Average cost of service per car	\$0.805
Average weight per car, tons	33
Cost of service per ton (in and out)	\$0.0243
Total miles operated	8,804
Total number of cars handled in internal movements	15,202
Grand total cars (in, out and internal)	37,841
Cost of maintenance and operation per car	\$0.347
Cost of maintenance and operation per ton	\$0.0104
Cost of maintenance and operation per mile	\$1.49
Cost of service per working day by tractor	\$24.67
Cost of service per working day by teams	\$57.06
Saving per day	\$32.39

the relief to terminal congestion and the prompt dispatch of trains resulting from avoidance of baggage delays. The fact that the saving effected is not stated on certain installations does not indicate absence of saving but rather that the figures were not available, as the installations in question would be near the top of the list. Under the heading "Number of Trucks" is indicated the number of trucks in service at the be-

PENNSYLVANIA ELECTRIC TRUCKS—WAREHOUSE TRUCK WITH TYPICAL LOAD

PENNSYLVANIA ELECTRIC TRUCKS—BAGGAGE TRUCK OF STRAIGHT-FRAME CLASS

ginning and at the end of the year, but the averages are based on the actual truck months.

The electric tractor which was described in the *ELECTRIC RAILWAY JOURNAL* for April 26, 1913, had an average daily performance during the first six months of 1915 as follows: Hours on charge, 8.1; hours in service, 8.2; discharge in ampere-hours, 526.1; miles per day, 12.8; number of cars handled, 36.3; total movement per day, 25; total weight handled in tons per day, 1215.8. Since the tractor was placed in service the number of cars handled per month has increased from 690 to 920, and the cost per car has decreased from 83 cents to 58 cents.

Table II on page 865 shows cost data obtained from the operation of this machine. In this connection it is also interesting to note that in two and one-half years of service there has been a loss in time of only nine days due to failures of the machine. The return on the investment is 71.4 per cent, or a daily saving of \$32.39. The cost of the service per ton, based on the cars moved in and out of the warehouses, is 2.4 cents, but the operating cost on all cars handled is only 1.04 cents per ton. Internal movements have reference to cars moved from point to point within the trackage operated by the tractor, these not being included in the total cost of the service.

National Association of Railway Commissioners

The twenty-seventh annual convention of the National Association of Railway Commissioners was held in the Municipal Auditorium at San Francisco, Oct. 12 to 16 inclusive. Among the reports presented were those on grade crossings and trespassing on railroads; legislation; powers, duties and work of railroad commissioners; railroad taxes and plans for ascertaining fair value of railroad properties; rates and rate-making; railway capitalization; safety appliances; statistics and accounts of electric railways; rails and equipment, and physical valuation.

At a banquet tendered the association by the California Railroad Commission on Oct. 13 about 750 delegates and guests were present to hear the speakers. Max Thelen, president California Railroad Commission, acted as toastmaster. Clifford Thorne of the Iowa Railroad Commission, president of the association, spoke briefly on the topic, "Is Regulation Worth While?" Theodore N. Vail, president American Telephone & Telegraph Company, gave an address on "Some Observations on Modern Tendencies." Warren Sanford Stone, president Brotherhood of Locomotive Engineers, presented some statistics on the relations between railway earnings, railway financial practices and railway employees' pay. Judson C. Clements, member Interstate Commerce Commission, made an address on "Public Control of Railway Capitalization." Paul Shoup, president Pacific Electric Railway, Los Angeles, Cal., spoke on "The Railroads and the Public," and John M. Eshelman, former president California Railroad Commission, made an address on "The State and Public Utilities."

In the election of officers, Judge Robert R. Prentice, chairman Virginia Corporation Commission, was chosen president of the association, and Max Thelen was made first vice-president. E. C. Mills, New Hampshire State Commission, was elected second vice-president, and William M. Connolly, chief clerk of the division of valuation, Interstate Commerce Commission, was re-elected secretary of the association. Washington, D. C., was chosen for the next annual convention, which will meet on Nov. 14, 1916.

Motor Cars on Railroad Systems Discussed by New York Railroad Club

At the meeting of the New York Railroad Club, held on Oct. 15, W. R. McKeen, consulting engineer Union Pacific Railroad, Omaha, Neb., presented a paper on "The Value of Motor Cars on Railroad Systems." He showed that on many steam railroad branch lines the use of the gasoline motor car would increase revenue by stimulating passenger travel and would decrease operating expenses so as to make passenger travel profitable. He stated that the financial success and universal popularity of the trolley car is not so absolutely the result of the fact that it operates on city streets and picks up passengers at street corners, for on the most successful interurban systems the passengers are taken aboard at stations as on steam railroads. The electric cars with frequent service can be scheduled as to leaving and arriving times to suit the convenience of the public, and in consequence they get the business. Mr. McKeen showed how the same purposes can be accomplished on branch steam railroad lines by means of the gasoline motor car. He stated that on some branch lines the average passengers per train will run below twenty, while even under favorable conditions the average will be only between thirty and forty, one-third of the train capacity. The motor car permits passenger and freight service to be separated and each can be furnished according to its own requirements.

Mr. McKeen's paper provoked very lively discussion, among those taking part being H. B. Emerson, consulting engineer; Arthur L. Jones, General Electric Company; E. B. Bailey, purchasing department Union Pacific Railroad, and Roger B. Williams, Jr., president Central New York Southern Railroad. While in the discussion attention was directed to the high cost of the gasoline motor car, its utility was especially emphasized. Mr. Williams, whose road is a short one connecting Ithaca and Auburn, N. Y., with an electric system in Ithaca, stated that the experience of his company with the motor cars was very satisfactory.

Rust Protection in Steel-Car Design

The subject of steel-car design from a protection standpoint was discussed at some length at the recent Master Painters' Convention in Detroit, Mich. It was said that, in the construction of steel cars, the body should be made as plain as possible. No countersunk rivets or butt joints should be used. Open corners should be eliminated as far as possible, as they will hold dust and moisture, ultimately causing corrosion. Sharp corners should also be eliminated and the joints should be soldered inside and out. Better results are obtained where Gothic sash are eliminated and where the monitor decks are plain and without projections that will hold dust, cinders and moisture. Roofs also should be of the plain-arch type and should be constructed without standing seams, and where side and deck panels are used they should be bent in one piece. The arch type has preference over the monitor-deck roof on steel equipment for this reason. Better results will be obtained if the interior of the steel car is finished in wood, as expansion and contraction on a steel finish causes the paint to crack. In general the delegates expressed an opinion that was in favor of special smooth steel sheets for passenger cars, claiming that the extra first cost of these sheets will be fully warranted from the standpoint of painting and maintenance. Some roads were said also to have used aluminum doors with very great success, as it was very difficult to prevent the corrosion on the inside of steel doors.

Record Reconstruction at Galveston

A Mile-Long Trestle Was Built in Seven Days, Subsequent to the Great Gulf Storm of Two Months Ago, Serving to Re-establish Rail Communication with the Mainland

The cyclonic storm of Aug. 16 and 17 at Galveston, Tex., which cut off the water supply and destroyed communication by rail between the island city and the mainland, involved extraordinary efforts in the work of reconstruction, according to E. B. Van de Greyn, consulting engineer, Houston, Tex. Every resource at the city's command was called upon, with the result that in seventeen hours after work was begun water was flowing across the bay through a hastily built pipe line laid on what was left of the causeway, and it took only seven days for an army of workers to construct a mile of timber trestle to restore railway connections across the bay.

Although Galveston, after the storm, had boat service which supplied food, it was imperative that rail connection with the mainland be restored as quickly as possible. A large force of men was at once put at work getting tracks in shape leading to the causeway, and the building of a single-track creosoted pile

GALVESTON RECONSTRUCTION—ERECTION OF POLE LINE ON TEMPORARY TREESTLE

trestle was commenced as soon as equipment and materials could be delivered. The Santa Fé Railway undertook the building of the 3700 ft. at the north end, and the Southern Pacific Railway handled the 1700 ft. at the south or island end. On the latter section a railroad pile-driver was used at the island end and a slip or skid driver was started from the southerly end of the arches. For the 3700-ft. section a railroad driver was started from the mainland end, a skid driver from the northerly end of the arches, and another skid driver started on cribbing at an intermediate point.

Materials were brought in on barges and floated to the drivers. A temporary track laid outside and to the east of the approach and extending out from the mainland was also used for handling supplies. Bents were 14 ft. on centers, four piles to a bent. Driving was carried on day and night with two twelve-hour shifts and in seven days 5400 ft. of pile trestle was built ready for train service.

Steam trains and the interurban cars from Houston are now operating over the pile trestle. The interurban cars are taken back and forth across the trestle by locomotive, but the Stone & Webster Company is now constructing a trolley pole line next to the trestle to enable cars to operate across it under their own power.

First Annual Convention of Safety Federation

Adoption of a model ordinance to govern all street traffic which will be offered to cities all over the country as a basis for legislation was the big feature of the first annual convention of the Safety Federation of America, held in Detroit, Mich., on Oct. 18, 19 and 20. The model ordinance for cities which will form the vehicle for activity of federation members for some time to come was prepared by the street traffic committee of the federation, of which Police Commissioner Gillespie of Detroit is chairman. The report of the committee's deliberations fills a printed booklet of twenty pages and gives in detail the effort to establish a standard for traffic regulations in all cities of the United States.

While the federation ordinance aims particularly at the control of automobile traffic its provisions will be of vital interest to street railway operators because of the number of collisions between automobiles and street cars. It covers licenses, lights, brakes, warning signals, whistles, noise, smoke, accidents, the way vehicles are to be driven, speed, age of drivers, barring of intoxicated drivers, distance from street cars, rights of pedestrians and numerous other matters, giving the police full control of all traffic.

Standard police traffic signals, to be used in all cities, are among the especial provisions. One of the most important clauses is that every automobile driver must have a license from the police of his city. He must be sixteen years of age and must not have physical ailments that might affect the operation of the car. In addition to the model traffic ordinance the convention decided to issue a safety-first primer for children and distribute millions of copies all over the United States.

Safety-First Meetings in Ohio

On Sept. 16 two meetings of employees of the Northern Ohio Traction & Light Company were held in Akron, Ohio, in the interest of the safety-first movement. More than 500 persons attended the afternoon meeting, and 1000 were present in the evening. Special cars on the northern division brought many of the employees to the city. For the past two years the company has been deeply interested in the safety-first movement, and its men have been organized to carry out the idea. As a result the reduction in the number of accidents has been more than 50 per cent. This record was made in spite of the fact that the number of car-miles operated was larger than ever before. The increase in the number of automobiles in use has also made the liability to accidents greater than in the past. The road has a safety committee of fifty members selected from the 1600 or 1700 employees, and the suggestions made by this committee are generally adopted.

Company Rewards Employee for Good Service

Homer S. Martin, interurban conductor for the Southern Traction Company, Dallas, Tex., has been presented with a gold-headed umbrella engraved as follows: "Presented to Homer S. Martin by Southern Traction Company in Recognition of Good Judgment and Faithful Performance of Duty on Sept. 21, 1915." On the occasion referred to another car crashed into the interurban which Mr. Martin was running near Ennis. Although he had ample opportunity to escape, Mr. Martin stayed at his post and endeavored to get his car out of the way. The company also presented Mr. Martin with passes for himself and wife over all its lines.

DELEGATES AND GUESTS OF THE AMERICAN ASSOCIATION AND MANUFACTURERS' ASSOCIATION ASSEMBLED IN CONVEN

American Association News

Chicago Selected for Mid-Winter Meeting—Successful "Red Special" Tour Ended in New York on Friday—

Dr. E. B. Rosa Addressed Washington Section—Denver Tramway Section

Enjoyed Fine Illustrated Lecture

SAN DIEGO AND EASTWARD

Friday, Oct. 15, was Transportation Day at the Panama-California Exposition. The San Francisco convention delegates left the Coronado headquarters for the exposition grounds at 10 a. m., and were officially received in the president's reception room at 11. An address of welcome was delivered by George Burnham, vice-president of the exposition. This was responded to by William Clayton, vice-president and managing director of the Spreckles Companies, and by Charles L. Henry, president of the association. The party then divided to inspect the buildings and exhibits of the exposition and to attend the various features on the program arranged by the exposition authorities for Transportation Day. These included a "monkey drill" by the First Cavalry, U. S. Army, a concert by the band of the 13th Coast Artillery Corps, a special organ re-

cital by Dr. J. Humphrey Stewart on the large outdoor organ, and a reception at the Women's Headquarters, California Building, tendered to the visitors by members of the Women's Boards.

Saturday was Aviation Day at the exposition, but there was no flying on that day owing to the recent accidental death of one of the aviators. However, the visitors inspected the flying machines in the hangars, after which they returned to headquarters for luncheon. In the afternoon a special train on the San Diego & South-eastern Railway took the guests to Tia Juana, Mexico, the Monte Carlo of the Southwest, and returned them to the hotel in time for dinner. The Eastern journey was begun at midnight on Saturday, Riverside being reached early Sunday morning and several hours were spent there. Monday, Oct. 18, was spent in the Grand Canyon of Arizona, and on Tuesday afternoon a two-hour stop

CONVENTION PARTY IN THE OPEN-AIR GREEK THEATER AT THE UNIVERSITY OF CALIFORNIA DURING A VISIT TO OAKLAND AND BERKELEY ON OCT. 8

PHOTOGRAPH OF THE PASSENGERS OF THE CLAREMONT AT SAN FRANCISCO, CAL., OCT. 8, 1915. BUILDINGS OF THE PANAMA-PACIFIC EXPOSITION IN BACKGROUND

"LOOKING PLEASANT" ON THE CLAREMONT GANGPLANK DURING VISIT TO OAKLAND AND BERKELEY

ON THE SALOON DECK OF THE CLAREMONT DURING VISIT TO OAKLAND AND BERKELEY

THE EAST AND THE WEST MEET ON THE DECK OF THE STEAMER CLAREMONT, DURING VISIT TO OAKLAND AND BERKELEY ON OCT. 8

was made at Albuquerque, N. M., where the attention of the visitors was attracted to the new one-man cars recently put in operation on the local railway system. These cars were double-ended with small wheels and with "Wee" motors. They were reported by the management to be operating very satisfactorily.

The remainder of the journey was uneventful but it was enlivened by various guessing and other contests, and it ended successfully by the arrival in New York on Friday morning.

The illustrations on pages 868 and 869 will serve as a permanent souvenir of the "Red Special" tour. All of these views were taken on Oct. 8, the final day of the convention, and the one on which the exercises were held at the exposition grounds. For the views of the excursion later in the day to Oakland and Berkeley, this paper is indebted to W. R. Alberger, vice-president and general manager San Francisco-Oakland Terminal Railways.

In the telegraphic report last week of the presentation of testimonials to the managers of the Red Special train at Coronado Beach on Oct. 14, a line was omitted which caused an error in the case of two of the gifts. E. C. Cook, of the New York Central lines in charge of the train, received a traveling case, and the purse was given to Fred. C. J. Dell, assistant to Secretary McConaughy, in recognition of his many courtesies to the delegates on the trip.

CHICAGO SELECTED FOR MID-WINTER MEETING

At a meeting of the American Association executive committee held on Oct. 7 in San Francisco, Chicago was selected as the place for the mid-winter meeting. The appointment of a committee of three by the president to arrange for the meeting was authorized, this committee to confer with a similar one from the Manufacturers' Association.

WASHINGTON COMPANY SECTION

The October meeting of the company section No. 4 was held on Oct. 11, with President George G. Whitney, chief clerk Washington Railway & Electric Company, in the chair. The attendance was about 125.

The feature of the evening was an address by Dr. E. B. Rosa, chief physicist of the United States Bureau of Standards, who explained to the section the work of the bureau, particularly that relating to the standardization of electrical appliances. He encouraged the members to secure copies of the publications of the bureau on subjects in which they are interested. After the address vocal selections were rendered by W. S. Madigan, accompanied by F. J. Allen of the commercial department of the Potomac Electric Power Company.

The president announced that a general business session would be held on Oct. 25, at which time it was hoped to greatly augment the present membership due to the operation of the new scale of dues. He also stated that Robert G. Wall would address the section on "The Science of Business Building." After the formal exercises a buffet luncheon was served.

DENVER TRAMWAY SECTION

At the meeting of the Denver Tramway Company section held on Oct. 21 an illustrated lecture was delivered by Dr. George B. Vosburgh on "Transportation and the Modern City." More than 100 colored slides were used in illustrating the lecture. Some of the slides showed scenes from various departments of the tramway company, including electrical apparatus, tracks, buildings and club lights.

COMMUNICATIONS

Reminiscences of Early Days in the Street Railway Business

BOARD OF PUBLIC UTILITIES

LOS ANGELES, CAL., Oct. 13, 1915.

To the Editors:

I spent yesterday at Universal City with those who had come down from the American Electric Railway Association convention in San Francisco. My mind was filled with thoughts of the early days of the American Street Railway Association, inaugurated by H. H. Littell, and of the wonderful changes that the years have brought about.

How many to-day appreciate the important assistance rendered the association in its infancy by the STREET RAILWAY JOURNAL? Very few, I fear. My thoughts were full of C. A. Richards, Thomas Lowry, Charles Green, W. H. Hazzard, William White, William Richardson and his son, William J. Richardson, Charles B. Holmes, Julius S. Walsh, P. C. Maffitt and C. B. Fairchild. Why prolong the list? Most have found rest and a new generation is now bearing the burden. When the association was formed I was the only civil engineer employed by the year on a street railway in the United States. That was the reason that I was so active at the early meetings. My paper on the "Ventilation of Stables" had a wide circulation here and abroad. It was copied in the *Scientific American Supplement* and when it appeared again in its columns some time after I thought the fact had been overlooked and wrote for information. The editor replied that the demand for that paper had been so great that the issue was exhausted and hence it was published again. What a change in motive power since I reported to the St. Louis Convention "On the Progress of Electricity as a Motive Power." I think that this was in 1884. Some years past the secretary of the association wrote me that it possessed no copies of the first five meetings, and asked me to send mine. This I did, for while I valued my copies very highly I thought the association should have them.

At the Universal City gathering I did not meet one of the "old guard," but it seems fit that the present generation should be reminded of those who have gone before and from whose efforts the giant association of the day results.

AUGUSTINE W. WRIGHT,
Commissioner.

Cumulative Voting

COMPAÑIA ELÉCTRICA Y DE FERROCARRILES DE
CHIHUAHUA

CHIHUAHUA, MEXICO, Aug. 31, 1915.

To the Editors:

Referring to the editorial on cumulative voting in your issue of Aug. 14, we should like to be informed more in detail regarding this method of voting at corporation meetings.

E. R. LOZAÑO, Director General.

[For the benefit of Mr. Lozano and others in the electric railway field who may desire some details in connection with the practice of cumulative voting, we are pleased to publish a few general facts and formulas.

When the voting at a corporation meeting is carried on under the cumulative plan, the result of the election is not determined alone by the number of shares voted. Each stockholder under such a condition is entitled to as many votes as shall equal the number of his shares of stock multiplied by the number of directors to be elected, and he may cast all of such votes for a single director or may distribute them among the entire num-

ber to be voted for, or any two or more of them, as he may see fit. The right to vote in such a manner is specifically guaranteed in some states by the fundamental law, in others by the corporation statutes, and in others by provisions in the corporate charter or by-laws. Cumulative voting, however, is not a common law right, and where it is not provided for by law or corporate rules, stockholders cannot insist upon resorting to such a method unless all consent to its adoption.

Various formulas have been devised to cover possible combinations that arise in connection with cumulative voting. The simplest case is where A desires to know the minimum number of shares necessary to elect a certain number of directors. This is shown by the following formula:

$$x = \frac{ac}{b+1} + 1$$

where x represents the necessary minimum number of shares, a the entire number of shares of capital stock, b the whole number of directors to be elected and c the number of directors sought to be elected by x shares. A typical case of a corporation with \$100,000 of capital stock (1000 shares, par \$100), five directors to be elected and two to be chosen by A will show the working of the system. The minimum number of shares here needed by A is 334, giving him 1670 votes, as compared to the 3330 votes of B's remaining 666 shares. If A splits his vote between his two candidates, each receives 835. If B is to defeat A's desire to elect two directors, he himself must elect four out of the five. Hence B must divide his vote among four candidates, three receiving 832 and one 834 votes. None of these, however, will win over A's directors with 835 votes each. By using this formula B on his side would find that it would be impossible for him to elect four directors without a tie in the face of A's opposition unless he himself held 668 shares and A only 332.

The foregoing formula presupposes that the capital stock is divided between two factions, but in actual practice there are often more than two factions and also a large outstanding neutral or unallied body of stockholders. Thus if M is known to have a certain number of shares under his control, the number of unallied shares that N must acquire by purchase or proxy to elect a certain number of directors is shown by this formula:

$$y = \frac{cr + b + 1}{b - c + 1}$$

where y represents the number of shares that N must procure, r the number of shares held by M, b the total number of directors to be elected, and c the number to be elected by N. If a third party, O, enters the lists with a desire to elect only one director when M has r shares and N has y shares, he must control z shares, where

$$z = \frac{y}{c} + \frac{1}{b}$$

Then N, in order to secure his c directors against M and not give up one director to O, must secure y' shares, where

$$y' = \frac{cr}{b-c} + 1$$

If O desires then to elect his one director, he must control enough shares to defeat one of M's candidates, or z' , where

$$z' = \frac{r}{b-c} + \frac{1}{b}$$

As previously intimated, while these formulas are designed primarily to show the very least number of shares necessary to accomplish different ends, they may

be used to calculate mathematically, when the disposition of the capital stock is known, the number of directors it will be safe for any faction to try to elect so as not to lose any directorships by overreaching.—EDS.]

Automatic Railway Substations

GENERAL ELECTRIC COMPANY

SCHENECTADY, N. Y., Oct. 11, 1915.

To the Editors:

The abstracts which you have recently published of the A.I.E.E. paper by Messrs. Allen and Taylor, and of my article in the *General Electric Review* on the subject of the automatic control of substations, will doubtless bring to the attention of many operating engineers the advantages which may be derived by such control. It is a little early to predict how far the automatic feature may be extended but it is possible at this time to note some of the applications and limitations of the scheme.

In proposing a system of control the design must be a compromise which will provide suitable protection against ordinary contingencies without introducing too many complications. There is almost no contingency which cannot be provided for if the equipment is made sufficiently complicated. With such a scheme as Messrs. Allen and Taylor described, many of the operations depend upon the proper functioning of various relays which cannot be considered as rugged pieces of apparatus. It is thus desirable to eliminate as many of these devices as is possible and experience alone will determine the minimum amount of protection that is necessary.

While the system described by Messrs. Allen and Taylor has been applied to synchronous converters it is evident that similar control is equally applicable to motor-generator sets.

The use of a load-limiting resistance is rather unique in its application here, but where the amount of energy to be controlled is large the size of these resistance units becomes formidable and cannot be neglected. It might appear at first sight that the energy wasted in the limiting resistance would be an item which would tend largely to offset in saving gained in no load losses by automatic operation, but when it is realized that the resistance is in circuit only on comparatively heavy overloads and that the overloads, particularly on a railway system, are of short duration, it can be seen that the energy loss is quite small. The overload relays are made adjustable to suit the conditions in each installation. Where automatic equipment is provided for lighting systems the losses, if a resistance were used, would undoubtedly be greater than those on a railway system owing to the fact that the overloads appear more gradually and persist for longer intervals. Thus, on lighting systems it might be preferable to provide some other means of load limitation.

As C. W. Place points out in his paper appearing in this month's issue of the A.I.E.E. *Proceedings*, a complete series of automatic stations may be employed on a system, or some of the substations may be automatically controlled and others manually controlled. It might even be feasible to have one or more of several machines in a substation automatically controlled and the rest manually controlled, one of the advantages in this last case being that a good load factor on the station is maintained under varying load conditions. It will be the local limitations on any one system which will determine what proportion of the equipment shall be automatic.

CASSIUS M. DAVIS,

Railway and Traction Engineering Department.

Girder and High T-Rail Renewals

MONTREAL TRAMWAYS COMPANY

MONTREAL, CANADA, Oct. 16, 1915.

To the Editors:

In reference to the exhaustive article in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 31 on "Girder and High T-Rail Renewals," the pertinent question "What is the life of rail?" is the one that has puzzled street railway engineers for all time. The rapid change in the types and sections of rail on account of the paving conditions, the evolution in weight, speed and traffic, density of rolling stock, changes in the chemical composition of rail, improvements in rolling-mill practice and demands of municipal authorities, make it impossible to answer with accuracy either theoretically or from experience. It is also very certain that a considerable amount of seemingly extravagant rail renewal on many systems during the past has been due not to absence of engineering ability to "make a dollar go farthest," but to other conditions which have become the controlling factors in the decision to lay new rails instead of relaying the old.

The desirability of arriving at some conclusion on which to base the life of rail is unquestionable, but thus far only a theoretical formula can be deduced and only a basis from which the subject may be discussed can be arrived at. The line of economical life cannot be based entirely on a formula but it may be possible to test financial operations with it.

In the first place, it is necessary that we decide what should be considered the reducible head area; whether in the case of plain girder rail it is that portion of the head above a line drawn horizontally between the top of the fillets, or bottom if you please, or where the vertical sides of the head intersect the lines defining the under side, or whether it is that area above the lines of the underside of the head intersecting at the center of the web. The latter is probably the more definite and should be considered 100 per cent.

In the case of grooved girder and tram girder rail the practical reducible area is much more difficult to fix. Certainly it is not where the tram or groove becomes flange-ridden. However, when this stage of wear is reached the effect on wheel flanges becomes a factor. Frequently some of the most prosperous properties are seen with grooved girder rail worn to the point where the lip or tram has been entirely sheared off without seriously affecting the track's operable condition, but probably subjecting it to rather unusual maintenance charges for both the track and paving.

When the reducible head area is found or agreed upon (this should be considered separately as regards the type of rail and whether it is to be used on tangent track or on curves) and the ultimate wear limit is considered, it is found that the percentage of allowable head wear depends as much on the manner in which the head is worn as on the section of the rail itself, and many vary from one extreme of 20 per cent to the other extreme of 60 per cent to 70 per cent of total head area. In my opinion a reduction of 35 per cent of the area is a fair average wear limit, and I believe that my conclusion is borne out by many engineers of experience.

To determine the economical phase of rail renewals during reconstruction it is necessary to know the tonnage or wheel movements carried by the old rail from the time of installation, and also the prospective moving loads, from which the approximate life of the rail in years may be estimated. It will be found that the results will vary with different types and weights of rail and classes of construction.

In a certain reconstruction work caused by tie and

foundation failure (which, by the way, was solid concrete) it was observed that 1,760,000 tons had been moved per 1/64 in. of vertical wear. The total wearing value was assumed at 40 per cent of the head area or about 5/8 in. of vertical wear. This was found to work out to a fifteen-year total life for the rail. With this as a basis and assuming the probable future traffic and wear, it was found to be economical to make a complete renewal of the entire track construction unless the rail had at least seven years of remaining life. Naturally, years only enter into calculations of this nature when finances are involved and not economical physical values where percentages only should apply.

From the noted wear of 1/64 in. per 1,760,000 tons movement it might be suggested that an assumption be made that the ultimate economical life of a rail is reached when it has carried 70,000,000 tons, corresponding to a total vertical wear of 5/8 in. or 40 per cent of total head area of this particular section. In a recently written work treating on this subject, published in Europe, a figure of 40,000,000 tons was given for eight years of past life and the remaining life put at eight years, thus making a total of 80,000,000 tons as the ultimate tonnage which the rail would carry. This is near the figure arrived at by my own observations. This might mean a rail life of fifteen years under a heavy car and vehicular traffic, twenty years or thirty years in smaller communities, or, under correspondingly less traffic, even fifty years.

Other observations, well over 100, indicate that the average vertical reduction per year on a certain section of plain girder rail on a large property was 0.021 in., giving a wearing life of eighteen years. On another property some fifty scribings gave a wearing value of fourteen years. Both of these calculations were based on a 35 per cent reduction of the head area of plain girder rail. These may be easily reduced to terms of tonnage or car movement, whichever is considered most convenient.

Causes necessitating track reconstruction, such as paving conditions; worn, corroded, corrugated, or surface bent rails; tie, joint or foundation failures; municipal demands, etc., are so numerous that a large percentage of these causes preclude the application of any definite formula in considering the question of rail renewals, except under what might be termed ideal conditions. Even when ideal conditions exist and a rail-wear limit has been fixed, it is still questionable if any formula such as was suggested in the article could be applied.

Such conditions, when they present themselves, would undoubtedly be worked out along the lines suggested, though perhaps not reduced to a formula. The final decision would be made not entirely on the result of the calculations, but according to the engineer's knowledge and experience of the local conditions and the time, labor, materials and finances available for the work. Even granting that all these were at the engineer's disposal, local considerations, such as relaying partly-worn rail in some less-traveled section of the system, might become the governing factor in the final decision.

Each system, and in fact each street, has its concluding factors in determining when the rail is ready for renewal, and these can only be determined definitely by examination, experience and knowledge of past and future demands. The joint is not such an important factor as it has been the custom to believe. With the advent of the several joints of the welded type which can be readily applied by skilled labor, the improvements in mechanical joints and the devices for building up and grinding off worn or cupped joints, it is pos-

sible to keep them in good condition even when the rail itself is made useless by corrugation, brake applications or rolling of the metal.

One instance has come to my attention where $\frac{1}{4}$ in. was added to the height of the head of a plain girder rail in order to prolong its life. Actual experience with this rail was that before even the additional $\frac{1}{4}$ in. was worn off the municipal authorities demanded a rail of the grooved girder type. Accordingly the plain girder rail was removed with probably the same wearing value as the section originally had before the $\frac{1}{4}$ in. was added.

Summing up the rail renewal question it seems to me that:

1. To determine a fixed percentage of head area to be used generally as the ultimate rail wear limit is impossible, as it is bound to vary with the head area, the weight and type of rail and the manner in which it is worn.

2. Each section of rail and in fact each local situation will have a wear value of its own which should be determined accordingly from the observed rate and manner of wear.

3. The rate of rail wear and the ultimate wear limit should be known or considered in terms of wheel or tonnage movements, and the future wear value in years determined from this.

4. A definite formula as a guide in determining rail renewals during track reconstruction can only be used when the question can be determined solely from an economical standpoint.

5. Considering the innumerable factors entering into the renewal of rail the actual economical life is not the most important one.

6. The conditions governing each piece of track renewal are usually purely local, even as compared with other sections of the same property, and the question of rail renewal must be governed by these conditions.

These conclusions apply generally to all types of rail, but more particularly to plain girder rail. Grooved and tram girder rails involve many different considerations, and I am not prepared to make any definite statements regarding them owing to the usual lack of information.

These comments also apply only to the problem of rail renewals as it confronts the street railway engineer in his daily practice. When considered in connection with the appraisal of a system of track work, and the percentage of depreciation is to be determined, the question must be looked at from a different standpoint since the appraisal of any system is more or less in the nature of a general one.

No definite standard seems to have been established in approaching the various phases of the question of track appraisal. As a basis to determine rail depreciation it seems quite reasonable that a general fixed wear limit might be established, even though it may not have any appreciable effect on a total valuation. The average value of depreciated rail is a comparatively small item in the appraisal of track construction; the substructure presents a much more expensive and complicated problem.

In conclusion I would say that it seems scarcely logical that track depreciation should be considered on an assumed basis of a certain percentage per annum. The more scientific way, it seems to me, would be to consider it in recognition of traffic carried, or in terms of ton or wheel movements per square inch of area worn, thus securing a common base or standard which may be applied generally to all properties notwithstanding their wide variation in traffic density.

W. F. GRAVES, Chief Engineer.

BROOKLYN RAPID TRANSIT SYSTEM

BROOKLYN, N. Y., Oct. 6, 1915.

To the Editors:

The article on "Girder and High T-Rail Renewals" which appeared in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 31, 1915, is a very broad treatment of a subject which is of much importance to maintenance engineers at the present time because their efforts are largely directed toward reconstruction of existing lines. Many properties are forced by present financial conditions to consider track renewals with the view of economizing in all possible ways. Hence such studies of rail life and the economies of the renewal problem have great value, especially when covered in such an exhaustive way.

There are a number of conclusions presented in the article and the following comments on them appear appropriate: Experience seems to warrant the correctness of conclusion No. 1. There is some doubt as to just how much value there may be in the "betterment" of chemical composition of rail mentioned in conclusion No. 2. Improvements in the method of manufacture are much more important and there is still room for advancement along this line. The statement made in the article that "apparently corrugation has been eliminated or at least greatly delayed by the titanium treatment" is questionable. The writer has found instances where corrugation developed rapidly, although the rails were so treated.

There can be no disagreement with conclusion No. 3. In addition to joint failures, corrugation, especially on rather old rail, should be included in conclusion No. 4 as an important factor in limiting rail life. It is often impossible to grind them out without removing the last wear value. Conclusions No. 5 and No. 6 seem to be true as a general observation. Concerning conclusion No. 7, the wheels will bear more study with respect to their influence on rail wear. This is especially true of the maintenance of correct wheel contours. In connection with conclusion No. 8, it might be stated that the more recent girder-rail designs appear to have wear areas more nearly equal to plain girder T-rail sections.

Arbitrary headwear limits as a basis for rail renewals, mentioned in conclusion No. 9, have not, in the writer's belief, been very much used by street railway engineers. The writer fails to see the use in attempting to set arbitrary wear limit values for American Electric Railway Association's rail sections as suggested in conclusion No. 10. They would have to cover too many types of wheel flanges and treads. The wear limits given in conclusions Nos. 11, 12 and 13 seem reasonable. Conclusions No. 14 and No. 15 are the most important and contain the essence of the whole rail-renewal and wear problem.

R. C. CRAM,

Assistant Engineer Way and Structure Department.

Modification of Tunnel Permit Sought

The Public Service Commission for the First District of New York has applied to the Secretary of War for a modification of the permit granted by the government for the construction of the proposed tunnel under the East River from Fourteenth Street, Manhattan, to North Seventh Street, Brooklyn. This permit makes the city responsible for all damages which may occur in the prosecution of the work. The commission fears that such a condition would make the city liable for all damage, even such as may be beyond its control. A similar provision was eliminated by the government in the permit for the new tunnels under the Harlem River, and the commission requests that it be omitted from the permit for the Fourteenth Street tunnel.

Speedy and Inexpensive Pole Moving in San Francisco

BY S. L. FOSTER, CHIEF ELECTRICIAN UNITED RAILROADS OF SAN FRANCISCO

The accompanying illustration shows how iron poles with their concrete settings are raised, lowered or moved in San Francisco. The California pioneers laid out sidewalks that have proved in modern times to be too generous and when 19-ft. sidewalks are reduced to 15 ft., or 15-ft. ones to 12 ft., the trolley poles have to go back. In the past twenty years several thousand such involuntary pole-moving jobs have arisen, and the illustrated appliance as originally devised has proved so far to have no superior for speed and economy.

The pole is clamped between two 1-in. x 7-in. x 6-ft. wrought-iron plates by four 1-in. machine bolts and a $\frac{3}{4}$ -in. cupped set-screw. These rest at each end on

POLE-MOVING APPLIANCE USED IN SAN FRANCISCO

heavy house-raisers' screw-jacks which stand on 3-in. x 12-in. x 8-ft. planks resting on $3\frac{1}{2}$ -in. diameter iron pipe rollers. When the pole and concrete setting has been cleared from the adjacent earth and hoisted slightly from the ground the whole load and appliance is rolled back by crowbars on 5-in. x 12-in. x 16-ft. way-planks.

Laborers do all the work. If there were enough of these jobs to make it pay, faster-operated lifting jacks would reduce the cost. The simple house-raising jacks, however, are foolproof and more suitable for laborers and the sandy soil in which the tools are often thrown about.

The appliance is used also for raising poles and their settings where grades are raised, or for lowering them when the grade of the walk is dropped.

On very long moves the trenching may cost more than the expense of setting a new pole and digging out the old one but on moves of 4 ft. or 5 ft. the use of this appliance results in the move being made for about

half the cost of the pole substitution plan. There is approximately the same amount of digging in both cases but, whereas with the appliance there is no concrete work, with the pole-substitution plan the new pole must be set in concrete and the old pole must be chopped out of the hard old adhering concrete before it can be removed. Furthermore, there is surplus excavated material to be hauled away under the latter procedure and none in the former.

No guys are usually needed in this work as, on account of the mass of concrete about the lower part of the pole, the center of gravity of the whole is below the point of attachment of the clamping plates and the pole moves back erect and perfectly safe. The span wire is cast off temporarily until the pole has been located in its new position and the excavated soil back-filled and tamped or flooded-in, according to its character.

The photograph shows the appliance in place in an unusually difficult situation. This iron pole and its 2-ft. x 2-ft. x 6-ft. concrete setting had to be raised 5 ft. and moved back 6 ft. in a treacherous, new, dry, sand fill.

Watch Standards

BY A. J. BOARDMAN, DIVISION SUPERINTENDENT
TERRE HAUTE, INDIANAPOLIS & EASTERN
TRACTION COMPANY

Along with the standardization of equipment, overhead material, roadway, details of electric lines, will eventually come the minimum standard of watches in the train service of interurban lines. Comparatively little has been said on this subject, although reference has been made in the *ELECTRIC RAILWAY JOURNAL* on Sept. 27, 1913, to the excellent systems of watch inspection on the Illinois Traction System, Aurora, Elgin & Chicago Railroad and Chicago & Milwaukee Electric Railroad. In the past it has been found, in spite of strict methods of inspection, that trainmen have substituted watches for inspection and carry inferior grade watches. This has led to the numbered inspection card, which has to be returned whether the watch is rejected or accepted, and the frequent and additional check of watches on the road to see if trainmen are carrying the watches which they had inspected.

On the Terre Haute, Indianapolis & Eastern Traction lines watch statistics show a predominance of Hamilton watches, ninety-three being used. Other makes include Waltham, thirty-nine; Hampden, twenty-seven; Illinois, twenty-seven; Elgin, ten; Ball, five; Rockford, one, and South Bend, one. The minimum standard size is No. 16.

The watch inspector of the Terre Haute, Indianapolis & Eastern Traction Company at Indianapolis, serves without pay and keeps record of all watches inspected twice a year in addition to frequent examinations that he is called upon to make. A watch inspector for the Terre Haute Division is located at Terre Haute. The rules governing the method of comparing time, registering, variation and use of standard clocks are the A. E. R. A. standard. The instructions to watch inspectors, which follow, are similar to those in use by several

steam roads and are worthy of careful consideration by all interurban lines.

INSTRUCTIONS TO WATCH INSPECTORS

When watches are presented for inspection, care should be exercised not to impose any hardship on the employees, and in case of any doubt to give the employee the benefit, if it can be done with safety to the service, but safety and reliability must be first considered. There must be no discrimination of any kind on account of trade preference. The inspector of watches must act for the company, not as an individual working for personal ends. Orders for inspection should be presented to the inspector on whom they are drawn. Watches that have been rejected by one inspector must not be passed by another, except upon an order from the superintendent.

The minimum standard of excellence for old watches now in service shall be of a grade equal to what is known among American movements as the "fifteen-jeweled, Breguet hair spring, patent regulator, adjusted" in such repair as will enable them to run within a variation of not to exceed thirty seconds per week. This quality of movement is represented by the Waltham "Crescent Street," the Elgin "Raymond" and other makes of equal grade adjustments. Their general finish should be such as to enable them to keep time as close as the average of the standard named. Inspectors should satisfy themselves that the watches are capable of giving reliable service, and in this there should be more than the average degree of certainty, for old watches, like old machinery, are apt to be more or less unreliable. All watches put up in open face cases must wind at the figure twelve, except such open face watches as have heretofore passed inspection.

The standard schedule for new watches includes twenty-one and twenty-three jewel watches. However, it has been demonstrated by experience that such high-jeweled watches are impracticable and short lived for railroad service. Their complicated and delicate construction renders them liable to get out of order easily and repairs are expensive. It is recommended, therefore, that employees, when purchasing new watches for railroad service, shall select seventeen and nineteen-jewel grades which have steel escape wheels, sapphire pallets, double roller escapements, Breguet hair springs, patent regulators, adjusted to temperature, isochronism, and five positions. Besides the regular standard (seventeen-jewels) the nineteen-jewel watches must have two bearings jeweled in the going parts of the main spring barrel, to fill all requirements.

In the care of the watch the following points are important, especially in railroad service: The movement must be clean and the oil fresh. If the oil becomes sticky or gummy from any cause, it must be removed and fresh oil put in. Frequently fine watches, after being put in order and regulated, will begin to change their rate at the end of six or eight months, caused by the chemical changes taking place in the oil. It should be noted that none of the pivots are running dry, especially in the balance pivots, which require careful attention, as their running dry causes irregular rating and injury to the pivots by their cutting from lack of oil. The hair spring is a very important item; it must be true, not warped or bent. The regulator pins should be straight, so that the hair spring will strike flat and true. The pins should be just close enough to allow a slight vibration of the hair spring between them, this vibration should allow a clear space to be visible, by the aid of the glass, between the hair spring and the pins, and the vibration must be equal

between the two pins. The regulator should stand as near the center of the index as practicable. The balance wheel must be true and perfectly poised. This should have constant attention, as the severe usage of railroad service may jar the balance out of poise or spring the pivots slightly, especially the heavy balances. The main spring should be taken out every time the watch is cleaned and tested to see if it fits the barrel properly, and if its movement is perfectly free and its strength fully developed to the end that the motion of the balance will not fall off during the first half of the day. The main spring must be free from gummy oil or rust spots, and slightly fresh oiled, but if found lacking in any of the above points, must be replaced by one of the best quality, as the finest watch will not keep correct time, if it has a cheap, poor mainspring.

The dial wheels should be free. Care should be taken that they do not come in contact with the dial. The second hand may be set too close to the dial without being noticed. There must be no friction between the minute and the hour hand, and the hour hand must not come in contact with the dial at the hub. The stem wind must be free and easily worked—not binding or grinding at any point. Lever-set watches are considered safer and are recommended for railroad service. The condition of the case should be an item for inspection—one with loose joints, gaping open, will admit dust and dirt and would not be a safe covering for a reliable movement. Every watch must be carefully tested for

Trainmen will leave this Card with Inspector.

NUMBERED INSPECTION CARD RETURNED BY WATCH INSPECTOR TO SUPERINTENDENT

magnetism, and if it is charged to more than its normal degree, must be demagnetized.

When employees leave their watches with inspectors for cleaning, "standard loaner" watches must be furnished free of charge by the inspector for temporary use. "Standard loaner" watches must have the same careful attention as the watches of employees, and must be fully up to the standard for new watches, as their correct rating fills a most important requirement of the time service.

The watch certificate, marked O. K., must be turned in at the company's office while the owner's watch is being repaired. Two inspections will be made yearly, during April and October.

Watch inspection certificates are to be given out at the general superintendent's office. These certificates are numbered so that they can all be accounted for, and should the inspector reject a watch, the first slip must be turned in and another one issued so that an O. K. can be given on the "loaner" watch. Then when the owner's watch has been repaired, he must apply to the office for another certificate so that an O. K. on the rejected watch can be given.

Yard Entrance Track Layout Possibilities

BY S. STRIEZHEFF, WAY AND STRUCTURE DEPARTMENT
BROOKLYN RAPID TRANSIT SYSTEM

The accompanying illustrations show the possibilities of variations in yard entrance layouts; not only theoretical variations as to angles and radii which may satisfy the whims and fancies of the cloistered draftsmen, but practical variations to conform with different requirements of construction and maintenance, and with the needs of transportation.

Confronted with the problem of laying out the special work for the entrance into a proposed car storage yard on the Brooklyn Rapid Transit system, the writer

originally designed scheme No. 1. The purpose of this was to allow cars ending their runs at this point in the system to enter the yard and the adjoining carhouse directly, with as little shifting and changing of trolley poles as possible, and to permit those cars going down Seneca Avenue to the end of the line to come back and enter the last three bays of the carhouse directly. If these cars had entered the yard there would have been involved a considerable holding up of traffic and changing of trolley poles.

At the suggestion of the transportation department the second scheme was prepared, with a view to having all branchoffs right-hand instead of left-hand. This involved the turning round of the yard-entering special

YARD ENTRANCE TRACK LAYOUT POSSIBILITIES—THREE SCHEMES FOR THE SOLUTION OF A COMPLICATED TRACK LAYOUT IN BROOKLYN, N. Y., IN ORDER OF DEVELOPMENT—THE THIRD SCHEME IS THE PREFERRED ONE FOR THE CONDITIONS SHOWN

work. However, as all yard tracks were to discharge into Seneca Avenue, or into DeKalb Avenue ahead of the curves leading into Seneca Avenue, it was found physically impossible to follow this suggestion for mere lack of room unless the right-hand half of the yard were to discharge onto a skew ladder, as shown. Furthermore, it would be necessary for such a ladder to connect with the main line directly on the curves leading into Seneca Avenue. This would require the placing of a switch on a rather sharp curve, a practice held to be very undesirable. After a conference of interested persons, this undesirable feature was eliminated by the suggestion of a skew ladder converging into a single track and then branching into tracks tangent to the main line east-bound and west-bound tracks on Seneca Avenue, the latter tracks turning into DeKalb Avenue on long radius curves with allowance for car clearance. It was possible to provide such curves by taking a corner off the property shown in the illustrations, which is owned by the company.

The next step in the development was the idea that it would be more convenient to have the left side of the yard provided with special work as shown in Scheme 1. The arrangement shown in Scheme 3 was therefore evolved and this is possibly the best arrangement under the circumstances. With this layout it is possible to have cars come into the yard and carhouse, and leave, in two directions, so as to accommodate short-line service and full-trip service. This is accomplished so effectually that there is practically no unnecessary shifting of cars and no running against traffic, with the exception that cars coming out of the carhouse down Seneca Avenue would have to run against traffic for some 80 ft. This layout also cuts down the fire hazard by half because, with tracks discharging in two directions, it is possible, in case of fire, to empty the yard in one-half the time required with a different track layout. Then again, the life of the yard-entering special work is practically doubled because only one-half of this special work is used by cars coming into, or out of either half of the yard. The position of track A represents another feature of convenience as it allows a more gradual down grade for this track which leads to a proposed lower-level transfer table and shop-track layout.

[NOTE—It would be interesting to have the ideas of other track-layout experts on this problem.—EDS.]

Uses of the Locomotive Crane in Electric Railway Work

BY G. J. KUHRTS, CHIEF ENGINEER LOS ANGELES RAILWAY

During the year 1914 the Los Angeles Railway purchased a 15-ton electrically-operated "Brown Hoist" locomotive crane. This crane has a 75-hp. motor to operate the hoisting and turning mechanism, and four 50-hp. Westinghouse motors for the operation of the car. It is also equipped with a single K-35-G-2 controller, a Westinghouse D-3-E-G compressor with straight and automatic air brakes, and weighs when ballasted about 60 tons. For convenience in operation in loading and unloading material we secured two lengths of boom,

PIILING TIES WITH LOCOMOTIVE CRANE

one 50 ft. and the other 30 ft. long, the shorter boom being sufficiently short to permit operation beneath our overhead construction.

We have recently been engaged in the reconstruction and paving of tracks in the southwest part of the city and have been able to effect a considerable saving by excavating the trench with the crane, using a 2-yd. grab bucket and loading directly onto cars on a side track. In cuttings from 14 in. to 5 ft. deep in sandy soil we have been able to save between 50 per cent and 75 per cent of the cost of ordinary shoveling, depending upon the depth of cut. The accompanying illustrations show the machine in the operations of loading and

LAYING TEMPORARY TRACK SECTIONS FOR DITCHING, AND DITCHING WITH THE GRAB BUCKET

those uses at locations where great strength, toughness and a maximum abrasive resistance are desirable.

3. The experiments with nickel and with nickel and chromium in certain proportions in rail steel have not, up to the present time, been entirely satisfactory; but the accepted employment of nickel steel in bridge construction, and the trials of nickel and chromium in other proportions in rail steel, especially when incorporated as two of the natural elements of the iron ore, justify continued use.

4. The use of high carbon (over 0.80 per cent) in rails weighing 85 lb. per yard, in combination with 0.92 to 1 per cent of nickel, and 0.24 to 0.29 per cent of chromium, has not been satisfactory. The conditions with rail sections of greater weight might be entirely different.

5. Further study of the qualities possessed by high silicon rails, that is, steel with over 0.30 per cent of silicon, is advisable.

6. The value of the use of ferro-titanium in rail steel manufacture as a "physic" for improving the condition of solidity of the metal is conceded, but at the same time steps should be taken to overcome its injurious effect in deepening the "pipe" in the ingot.

7. Heat-treated rails and those manufactured with the assistance of the electric process are at present in experimental use only, but the possibility of future value is promising, and the study should be continued.

Effect of Preservatives on Wood Poles

At the St. Louis meeting of the American Institute of Electrical Engineers, held on Oct. 19, F. L. Rhodes and R. F. Hosford presented an exhaustive report on the effects of preservative treatment on wood poles. The report covered large numbers of poles treated by several methods and the observation extended over a considerable term of years, some treatments dating back to 1897. The report included pole-length treatment, and treatment by the brush and the open-tank processes.

While it was stated that, because of the present incomplete state of our experience with the different types of treatment described, conclusions can be reached for only a part of the problems whose solution was sought, several important conclusions were reached. One of these is that the seasoning of poles affords at best only moderate advantages in the way of increased life, its greatest value being as a preparation for the successful application of preservatives. Another is that the practice of applying to poles a preservative high in antiseptic power and insoluble in water has been shown to yield increased life, the amount of preservative applied and the depth to which it is made to penetrate appearing to exercise controlling influences upon the results obtained. Again, mechanical failure of the treated layer is indicated as the principal limit to the effectiveness of the application of a preservative.

Among the deductions from the observations of poles treated for their whole length the following are significant: The principal cause of deterioration in the top section appeared to be the cutting off of the top, hence all timber should be completely framed before treatment. The bleached and other lighter colored poles yielded a percentage of decayed specimen considerably above the average for all poles inspected. As the lighter colored poles are presumably those which retain the lesser amounts of preservative it follows that the life will increase with the amount of preservative applied. Poles which were located at high altitudes showed more than the normal amount of decay, while the lowest proportion of decayed poles were located in muck. On one line 50 per cent of the poles showing no tar were decayed, as against 39 per cent decayed among poles

showing streaks of tar near the ground line, and 18 per cent decayed for poles streaked with tar throughout their length. The data from this line show that the conditions to which the top of the pole is exposed favor the more rapid removal of the volatile constituents of the preservative than occurs in the butt section. The poles suffered losses in the proportion of the low boiling constituents in the preservative, the data indicating that no appreciable loss by evaporation occurs in the case of constituents of the oil distilling above 270 deg. C.

The study showed that success with the brush treatment could only be expected when it was applied to seasoned poles, it being desirable that the part of the surface to be protected by the preservative should be dry and thoroughly cleaned. The preservative, preferably heated to 150 to 200 deg. Fahr., was applied to the cleaned surface by means of a brush, preferably one with a long handle, and the application was most conveniently carried out when the pole was placed so that it could be rotated while the preservative was applied

RATE OF DECAY OF CHESTNUT POLES COLLECTED AT MOUNT PISGAH, N. C., AND INSTALLED IN GEORGIA

to the upper segment of its surface. The best results were obtained by applying a second coat of preservative after the first had had time to work its way into the wood. There was no clear evidence of any advantage derived from applying a third coat. For the usual case of heavy decay concentrated at the ground-line section, a treatment extending from 1 ft. above the ground line to 2 ft. below it should be sufficient.

The open-tank treatment caused a substantially greater penetration of the preservative into the wood than did the brush treatment. The penetration was from $\frac{1}{4}$ in. to $\frac{1}{2}$ in. as compared with from $\frac{1}{16}$ in. to $\frac{1}{4}$ in. for the brush treatment.

Treatment with coal tar was found to be ineffective in preventing decay, as the tar formed a superficial coating, tar-coated poles deteriorating practically to the same extent as untreated poles.

There was no indication that decay will proceed more rapidly on treated poles, once it starts, than it does on untreated poles. The indications were, therefore, that any gain due to the retardation of the beginning of decay through treatment will be retained. The tests indicated a greater addition to the life of poles through treatment for a Northern location as compared with a Southern one.

Regarding the effect of treatment upon insect activity it appeared that, as the insects follow decay, the retardation of decay is accompanied by retardation of insect activity.

Alternating Current Signaling

A really comprehensive treatise covering the installation and operation of equipment for a.c. signals has just been published by the Union Switch & Signal Company of Swissvale, Pa., under the title of "Alternating Current Signaling." The book is no perfunctory description of a manufacturer's line of merchandise, but constitutes, rather, a notable addition to existing literature on a very important subject that is hardly understood by anyone aside from the experts who devote their entire time to this one phase of signal operation. In fact, the new book, which is made up in convenient pocket size and bound with leather, will unquestionably serve both as a reference work for signal engineers and as a text-book for those who feel the necessity for learning about the details of this relatively new and rapidly-growing feature of the railway industry.

In the historical sketch, which precedes the technical material, the authors have pointed out that it is due to the requirements of electric railways that alternating current signals first came into being some twelve years ago, and although their use was confined to electric railways for several subsequent years, they have now been installed upon thousands of miles of steam railroad, bidding fair eventually to displace the older d.c. signals altogether. Their general introduction, which has been due not only to their improved economy but also to a vastly increased reliability, has as a matter of fact, eliminated so many of the weaknesses to which d.c. signaling is subject that the art is actually in process of revolution and the electric railways are in an excellent position to play a leading rôle in the changes in practice that are bound to come with more reliable apparatus. Indeed, the possibility of false clear signal indications has largely dominated the viewpoint of the steam railroads because of experience with d.c. signaling in the past. That their outlook is changing is now manifest, and the fact that electric railways have been instrumental in bringing this about, through the demand for alternating current signaling, lends special interest to that subject and makes the new book especially timely.

To make the work comprehensible to readers who are unfamiliar with the fundamentals of either alternating current or alternating-current track circuits, two of the first chapters have been devoted to an elementary exposition of their subjects. They are followed by a remarkably clear and thorough description of the various types of relays that are commonly used, including explanations of the features that are peculiar to each and their special uses, together with a very interesting set of curves showing voltages, currents and power factors to be expected with various lengths of block. A separate chapter is devoted also to track currents on electric railways owing to the complications involved by the propulsion current in the rails.

A chapter on signals, which covers the mechanical and electrical details of semaphore operation, submits an interesting comparison of series and induction motors and discusses existing practice in signal lighting. This includes a very complete section that is devoted to light signals of both the colored-light and beam-light types, these being accorded a visibility range of from 2500 ft. to 4000 ft. and being considered by the authors perfectly satisfactory for high-speed service.

The subject of transmission systems and power house equipment is covered by a highly technical chapter in which are discussed such matters as voltage and line-wire size, frequency, practical calculations of resistance, reactance and impedance drops and the like, this being of distinct value to the signal engineer, as the problem of transmitting the small amounts of power involved in

signal operation can find no parallel in the ordinary conditions that are considered in text-books on electrical distribution. This section is liberally interspaced with tables of general data and is throughout a thoroughly practical discussion for the benefit of those who have actually to install and operate the equipment.

Owing to its wide introduction for interurban signaling, the T. D. B. system is discussed in a separate chapter, and in this is published for the first time a circuit scheme for the arrangement. Other chapters cover a.c. interlocking and accessories, and the book concludes with an analysis of track-current calculations and a series of tables and data covering information that is useful to the signal engineer and maintainer.

A Straight-Line Hanger That Stays On

The Drew Electric & Manufacturing Company, Indianapolis, Ind., announces a new galvanized straight-line hanger type, No. 1039, known as the "Sta-on." As this name implies the hanger cannot be shaken off the span. This feature is obtained by fitting the top of the hanger with one pair of sister hooks at one end and a U-bolt at the other end. It is a simple matter to slip the hanger on the wire by means of the sister hooks and then to fasten it by screwing upward the two bolts of the U. It is clear also that these bolts also permit easy removal of the hanger. The top of the hanger is grooved slightly to bed the span wire.

The features of this hanger may be summarized as

STRAIGHT-LINE HANGER AND DETAILS

follows: It cannot accidentally come off the wire, either on bracket or span construction; in span construction, no matter how slack the wire, it will stay in an upright position; where span wire is slack in special work, the hanger will not drift out of line or turn sideways; it does not injure or strain the span or eye-bolts; it can be installed loose on new work, thus allowing the wire to be lined up.

This hanger eliminates all trouble in lining up trolley, as it does not have to be forced on or off the span a number of times to get the trolley in line. This advantage is very useful on curves. In general, adjustments can be made merely by loosening the bolts a little and veering the hanger around as much as may be necessary.

R. L. Weber, author of the article on "Kansas City's New Cars" appearing on page 771 of the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 9, calls attention to the fact that the name of Robert P. Woods, member of the Kansas City board of control representing the city, was incorrectly given therein.

News of Electric Railways

TRANSIT ISSUES IN THE COMING ELECTIONS

Voters in Detroit, Toledo, New York State, Des Moines, Philadelphia and Cleveland All Have Important Matters Before Them

The elections to be held in November will be unusually significant to the electric railway industry. In Detroit on Nov. 2 there will be submitted to the voters for their approval the purchase by the city of the lines of the Detroit United Railway within the city under terms agreed upon by the Detroit Street Railway Commission and the officers of the company. On the same day in Toledo the new street railway franchise to the Toledo Railways & Light Company will go before the electorate. In New York State on Nov. 2 the voters will have before them the question of acceptance of the new State constitution, with its significant provision making the Public Service Commissions constitutional bodies. Later in the month the new franchise for the Des Moines City Railway will go before the voters. The election in that city will be a special one and will be held on Nov. 20. In Philadelphia the successful carrying out of the transit program prepared by the Blankenburg administration hinges apparently on the election to the Councils of that city on Nov. 2 of candidates pledged to the support of the plan. In Cleveland subway and rapid transit franchises to the Cleveland & Youngstown Railroad and the Cleveland, Akron & Canton Terminal Railroad will come up for approval on Nov. 2.

Ten days before the Detroit purchase plan election finds a very definite alignment of interests on the question. Mayor Marx, the Street Railway Commission, and all the forces of the administration are backing the proposed purchase arrangement. Against the plan are the Federation of Labor, the Municipal Ownership League and the local union of the street railway employees. As previously stated, the labor people have taken the position that the proposed plan would be injurious to organized labor. The Municipal Ownership League is opposing the purchase on the ground that the unknown price will be so high as to prevent successful municipal operation. As for the Detroit United Railway it has lived up to its announced intention of not participating in any discussion concerning the municipal ownership proposal. In its last public utterance, made in August, the company did, however, protest against pending propaganda picturing the company as sort of a "foreign devil."

The Wayne County circuit judges have refused to enjoin the submission of the Detroit purchase proposition at the election on Nov. 2. At the same time the court refused to pass on any of the legal questions raised in the petition for an injunction to prevent the election, specifically reserving jurisdiction over all questions except as to the vote. The court ruled that the right of the people to vote on a matter like this is partly legislative and partly ministerial and, except in cases of imperative necessity, should not meet interference at the hands of the judges. The bill of complaint, upon which the injunction was asked, is likely to be revived in the Circuit Court if the purchase plan is adopted by the electors, inasmuch as it raises a number of questions as to the constitutionality of the contract entered into between the city and the railway whereby, if carried, the price of the property is to be fixed by the Circuit Court.

The work of Henry L. Doherty, chairman of the board of directors of the Toledo Railways & Light Company, in the interest of an extension of the franchise of that company seems likely to bear fruit. The special franchise committee of the Council in that city, after preparing a tentative draft of an extension ordinance for presentation to the Council, insisted at first on putting the matter before that body without any recommendation. Mr. Doherty contended that the work done in preparing the draft would amount to nothing unless the Council accepted or rejected the proposal. The committee still demurred. At this point the Toledo Franchise Association took the matter up and began the circulation of petitions for the initiation of the

franchise. On Sept. 13 the Council by a vote of twelve to six decided to receive the report of the committee. Before Oct. 2 petitions containing 22,135 signatures urging the submission of the franchise to a referendum vote at the November election had been filed with the city auditor. These signatures equalled the entire vote at the recent primary election, and most of those who signed were said to have expressed themselves in favor of the franchise.

If the revised constitution is ratified by the voters of the State of New York, the short ballot will be inaugurated in New York State at the beginning of 1917. The new constitution retains the Governor, Lieutenant-Governor, Comptroller and Attorney-General as elective officers, but the successors of the Secretary of State, the State Engineer and the State Treasurer are to be appointed by the Governor. The department of the State engineer in fact will be supplanted by a department of public works, with the head to have supervision of the construction, care, maintenance and operation of all the public works of the State, including canals, highways and public buildings, and this department will plan all the engineering, architectural and construction work required by the State department. If the voters approve the revised constitution the State budget will in the future be submitted to the Legislature by the Governor instead of being initiated in the Legislature and subject only to a limited veto power by the chief executive. The Governor's appointments are freed from the requirement of confirmation by the Senate, except in the case of members of the Industrial, Public Service, Conservation and Civil Service Commissions, which are regarded as quasi-judicial bodies. The Public Service Commissions are made constitutional bodies. So are the Tax Commission, the Industrial Commission and the Civil Service Commission.

In Des Moines litigation involving the validity of the franchise of the Des Moines City Railway was begun by the city in 1900. This long fight now seems likely to end with a franchise practically the same as the one under which the company then was operating. The new grant was drawn up by a committee representing the Des Moines Chamber of Commerce. It has been adopted unanimously by the City Council. Sentiment in the city appears to be overwhelmingly in favor of a final settlement of the franchise question on the basis now offered. The new franchise will provide six fares for a quarter, half-fare for school children, a guarantee of service as good as the best in any city of the nation the same size as Des Moines, and a valuation of \$5,000,000 as of the present time if the city decides to buy the property within twenty-five years, which is the term of the franchise. No valuation is fixed for the purpose of determining profits. The company guarantees the service and takes its chances on the profits.

In Philadelphia the success of the rapid transit plan advanced by Director of City Transit Taylor seems to hinge on the election to the Councils of representatives pledged to the transit program. The Philadelphia *Ledger* says that George D. Porter, until recently Director of Public Safety of the city under Mayor Blankenburg and now candidate of the Franklin party to succeed the Mayor, "wants the agreement made between the Department of City Transit and the Philadelphia Rapid Transit Company put into effect." This agreement provides in short for the immediate construction of the Broad Street subway, the Frankford elevated, the Woodland Avenue elevated and other lines at a cost of \$55,000,000, a universal 5-cent fare and abolition of the present exchange tickets. The *Ledger* said on Oct. 16: "There is nothing that stands between the people and the achievement of their desires except a group of selfish politicians. The Philadelphia Rapid Transit Company is on record as favoring the transit plan. There is none to object except a few 'leaders,' who do not wish this situation to pass without their getting something out of it. It is a simple thing for the people of Philadelphia to take matters into their own hands and decide this great issue now and for all time. All that they have to do is vote for candidates who favor rapid transit and against candidates who do not favor it."

The Cleveland & Youngstown Railroad ordinance, which will be submitted to the voters of Cleveland at the election on Nov. 2, is intended to permit the establishment of a high level freight terminal in connection with the rapid transit line. The franchise of the Cleveland, Akron & Canton Terminal Railroad, to be voted upon at the same time, gives the company the right to build a subway under East Fifty-fifth Street, Cleveland, from the lake front to Morgan Run on the south side of the city. This will open to a number of railroads entering the city from the south a strip of lake front of about 3800 ft. The companies now have no means of reaching the lake and all their freight must be transferred. It is the purpose of O. C. Barber, who is at the head of this movement, to erect an immense grain elevator and large coal docks and loading machines on the lake front, in order that the roads using the subway may have direct connection with the lake shipping facilities. The subway is to be operated by electricity, but will be used by steam railroads.

STRIKE AT WILKES-BARRE AGAIN

Traffic in the Wyoming Valley of Pennsylvania is tied up for the second time within six months by a strike of the employees of the Wilkes-Barre Railway. The trouble dates from last April, when arbitrators chosen by the company and by the employees awarded a sliding scale rate of wages after a comprehensive series of hearings in which both sides were heard. The employees filed objections to the award recently, alleging that when arbitration was agreed to by them it was on the condition that a flat wage rate be fixed. A majority of the board of arbitrators was called together, Samuel D. Warriner, representative of the company, refusing to attend. Thomas D. Shea, representing the men, and Dr. John Price Jackson, the umpire, repudiated the sliding scale award as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16, page 839. Since the first award of the arbitrators was reversed by themselves, the carmen demanded 27 cents an hour. T. A. Wright, general manager, refused to pay the rate, and as a result the strike was declared.

The company has taken advantage of the opportunity to make needed repairs to its lines, work and service cars being the only ones operated. These were not molested by the striking motormen and conductors. A statement given out by Mr. Wright made it evident that no change in the situation would take place until after a meeting of the board of directors. Mr. Wright holds that the men have broken faith by not accepting the original award of the arbitrators, and in his statement says that the question is now one of principle and resolves itself into which one is right, the company or the men.

An effort to mediate in the strike is being made by the State authorities. Patrick Gilady, mediator of the State Department of Labor and Industry, and James A. Steese, chief clerk to Commissioner John Price Jackson of the same department, arrived in Wilkes-Barre and held informal talks with several of the officers of the trolley men's union, and hoped to be able to arrange a conference with the officials of the company.

Holding that the original award of the arbitrators in the wage dispute between the Wilkes-Barre Railway and its employees is binding and without appeal, the directors of that company, in a statement covering a page of the local newspapers, set forth the position plainly that it will not agree to any suggestion made by two of the arbitrators who have repudiated their award. The only ray of hope to be found in the statement which might pave the way for an early settlement of the trouble is in the expressed willingness of the company to submit to the courts of Luzerne County the question of whether or not the two arbitrators had any right to repudiate the award.

A reasonable time will be allowed by the company for the men who are out on strike to return to their positions on the wage basis fixed in the original award of the arbitrators. The company desires to reopen its lines with all the men back in their places, but if at the end of a reasonable time, not definitely fixed by the company as yet, there are not enough employees back for duty, steps will be taken to fill vacancies with new and competent men. Union leaders refuse to comment upon the company's statement.

GOVERNMENT'S CASE AGAINST NEW HAVEN OUT-LINED

R. L. Batts, one of the special counsel appointed by the government to prosecute past and present directors of the New York, New Haven & Hartford Railroad on a charge of conspiring to monopolize the transportation facilities of New England, spent the entire session on Oct. 18 in the Federal District Court at New York in explaining to the jury the intricacies of New Haven finance. Mr. Batts told the jury that the government did not hold all combinations illegal and laid it down as a principle that the test of the legality of a combination was whether it was such as would be developed naturally in the normal way of business. Moreover, Mr. Batts told the jury they need consider not only what was done but what was intended to be done and that they should convict if they found an intent to monopolize.

In speaking of the acquisition of the electric railways of New England, which began in 1905, Mr. Batts said it involved the policy of spending however much money might be necessary to acquire a monopoly. He suggested the price paid for a property might be taken as another test by the jury of the legitimacy of the expansion it produced, and he instanced the purchase of the Rhode Island electric railway system from Senator Aldrich and his associates.

BUS FRANCHISE RECOMMENDED IN NEW YORK

The franchise committee of the Board of Estimate of New York City, composed of Mayor Mitchel, Aldermanic President McAneny and President Mathewson of the Bronx, recommended on Oct. 15 that a franchise be granted to the New York Motorbus Company to operate double-deck, side-entrance cars over 31 miles of streets in the Borough of Manhattan from Union Square on the south to Fort George on the north. The committee recommended rejection of the application of the Fifth Avenue Coach Company, which operates the only buses now running in Manhattan, for a franchise for new lines and extensions totaling, according to the committee's figures, 21 miles. It also rejected offers from Grindley & Brunner. Other competitors dropped out several months ago.

Two main north and south routes are laid out in the proposed contract. Starting at Union Square a West Side route would extend to Fort George by way of Seventh Avenue, Broadway, Amsterdam Avenue, Eighty-sixth Street, West End Avenue, Broadway and St. Nicholas Avenue. The East Side route would extend from Union Square to Ninety-sixth Street through Irving Place, Lexington Avenue, Twenty-third Street, Madison Avenue, Thirty-ninth and Fortieth Streets and Park Avenue. From 110th Street there would be a bus line to 168th Street by way of Manhattan Avenue, Morningside Park East, Convent Avenue and Broadway. The fare on these lines would be 10 cents. The 5-cent lines include three crossing Central Park on the transverse roads, others through Thirty-first, Thirty-third, Thirty-ninth, Fortieth, Forty-sixth and Forty-seventh streets, and two lines from Union Square to the Pennsylvania Station, all short cross-town lines. From each of the 5-cent cross-town lines a person could transfer to a 10-cent line by paying another nickel. According to the committee's report, the Fifth Avenue company offered the city a guarantee of from \$35,000 to \$65,000 a year, or a total of \$750,000 for the term of the contract, which is fifteen years, with ten years renewal privilege. The Motorbus company offered from \$30,000 to \$60,000 a year, or \$735,000 for the fifteen years. The Fifth Avenue company insisted, as the Motorbus company did not, that its payments to the city be deducted from any franchise tax that might be levied in the future. The most important feature of the Motorbus company's offer, according to the franchise committee, is that it agrees to extend its lines or to operate new ones whenever the city shall direct. It is also provided that if there is a deficit on the new lines thus ordered the city shall pay it, but if the deficit amounts to 75 per cent of the company's payment to the city under the franchise, routes will be abandoned as the city directs.

The New York Motorbus Company has deposited with the city a certified check for \$60,000 to guarantee performance if it gets the franchise. Its president is Howard Conklin

of 1 Wall Street. Other directors are Stanley M. Conklin and Harold B. Weaver, the company's consulting engineer, who is vice-president of the Manhattan & Queens Traction Corporation. The company agrees to have 100 buses running within eight months.

HOLYOKE ARBITRATION BEGUN

Arbitration proceedings in the Holyoke (Mass.) Street Railway's disagreement with local division No. 537 of the Amalgamated Association were opened on Oct. 19 at the Holyoke City Hall. The board of arbitration consists of Attorney James E. Cotter of Boston, appointed by Governor Walsh; Attorney William H. Brooks of Holyoke, representing the company, and former Mayor John J. White of Holyoke, representing the employees. James H. Vahey, Boston, is acting as counsel for the union, assisted by John H. Reardon, Worcester. T. D. O'Brien, Holyoke, appeared as counsel for the company. About 250 men are organized in the local union, and the company operates in Holyoke, Amherst and Sunderland, serving 75,000 people.

The opening session was mainly devoted to a review of the subjects to be arbitrated. The present scale of wages is: first six months, \$2.30 a day; second six months, \$2.45; second year, \$2.60; third year, \$2.70; fourth year, \$2.85 a day. The questions to be arbitrated are: (1) Shall the present scale be continued to June 1, 1916? (2) Will the company make its schedules in accordance with the so-called nine-in-eleven-hour law of 1913, and shall the company pay for all runs in excess of nine hours and not in excess of 9.25 hours, an extra half-hour's time; and for all runs between 9.25 and 9.5 hours one hour's extra time, at the exact rate of an hour divided by 9, viz.: First six months, 25% cents an hour; second six months, 27% cents; second year, 28% cents; third year, 30 cents; fourth year and thereafter, 31% cents an hour? (3) Will the company pay for overtime work done by motormen and conductors on other than regular runs at the exact hourly rate quoted above (from section 2 of the agreement)? (4) Will the company establish a nine-hour day for employees of carhouses, shops and miscellaneous departments for week-days, to be completed within ten consecutive hours, and for Sundays and holidays an eight-hour day to be completed within nine consecutive hours, at the present day rate? (5) When any conductor or motorman is ordered to report at any other than the regular reporting or relieving time, shall he be paid for all time between his regular reporting or relieving time and the time he is ordered to report? (6) Where men are compelled to dead-head to and from runs, will they be paid at their regular hourly rate? (7) In the computation of time, except as otherwise provided, shall fractions of hours be considered as full hours, and paid for as such? (8) Shall tower cars be operated at all times by motormen holding rating in the passenger service, and shall such cars be subject to the rules of seniority bidding? (9) Shall all runs of nine hours or less be considered as full days and paid for as such? It is also for the board to decide whether its decision shall continue until June 1, 1916.

FIXING THE BLAME IN CLEVELAND

The Cleveland (Ohio) Railway has been dragged into politics. Peter Witt, street railway commissioner, points to his record in that office and claims credit for maintaining the fare at 3 cents, although the people are now paying for transfers.

Harry L. Davis, another candidate, has expressed opposition to municipal ownership of either the street railway or the light plant and refers to the amount of money already spent on the municipal light plant, which is benefiting only a comparatively few people at the present time.

Charles P. Salen pledges aid to the street railway employees in securing a change in the operating schedules. He says the present schedules, arranged by Mr. Witt and the company, make swing runs the rule.

B. F. Mills, candidate for Mayor of Lakewood, is opposed to the pending franchise renewal there, and Frank G. Carpenter, candidate for Mayor of East Cleveland, is criticising the present administration because it did not force the company to move its tracks in Euclid Avenue while a sewer is being installed.

OHIO SUPREME COURT ON STARK COUNTY FRANCHISE

The Ohio Supreme Court, in a decision rendered on Oct. 19, holds that the franchise of the Northern Ohio Traction & Light Company in Stark County, which the company contended was perpetual because no specific time had been set for its termination, may be terminated by either party at any time. This suit was brought by Stark County in an endeavor to force the company to reduce the fare between Canton and Massillon from 15 to 10 cents. The lower courts held in favor of the company. It is believed that a suit will now be instituted to nullify the company's light franchise in Barberton. The conditions are much the same as those that apply to the railroad franchise in the county. The case may be carried to the United States Supreme Court.

Appeal in Toronto Extension Case.—The City Council of Toronto, Ont., has decided to appeal to the Privy Council against the order of the Ontario Railway Board and the decision of the Appellate Court confirming the order requiring the Toronto Railway to extend its tracks from the Canadian Pacific Railway crossing on Yonge Street to Farnham Avenue.

Marginal Railroad for Providence.—Construction and ownership by the city of a marginal railroad along the new city sea wall at Field's Point, together with tracks across city-owned land to connect with the Southern New England and New Haven lines beyond Allen's Avenue, will be recommended to the City Council of Providence, R. I., by the committee on harbor.

Ordinance Introduced for Extension of San Francisco Municipal Line.—Supervisor Charles Nelson has introduced before the Board of Supervisors of San Francisco, Cal., an ordinance providing for a bond issue of \$5,000,000 for the extension of the lines of the Municipal Railway. The extensions are to be into the North Beach, Sunset and Potrero districts and through Twin Peaks tunnel. The ordinance has been referred to the committee on public utilities.

Completing the St. Paul Southern to Rochester.—Directors of the St. Paul (Minn.) Southern Railway are considering a proposition to lease 25 miles of track of the Great Western or Northwestern Railway from Zumbrota to Rochester. The line is now operating between St. Paul and Hastings, and work is being pushed on the 34-mile stretch between Hastings and Zumbrota. Grading through to Rochester, if the lease is not consummated, is expected to be finished by May 1 and operation begun by Dec. 1, 1916.

Municipal Railway Employees Seek Wage Increase.—Representatives of the platform men employed on the San Francisco (Cal.) Municipal Railway have presented to the Board of Public Works demands for one day off each week and an increase in pay, which would aggregate about \$12,800 a year. The men are now receiving \$3 a day for an eight-hour day, this amounting to about \$78 a month. Under the present system they receive no pay for days they do not work. They are now asking for \$90 a month, with one day off each week.

Twelfth Year for Railway Technical School.—The twelfth annual winter session of the British Columbia Electric Technical School, which was established in January, 1904, has opened and throughout the coming winter employees of the British Columbia Electric Railway, Vancouver, B. C., who are interested in technical subjects will meet weekly to hear lectures and to discuss matters connected with the electrical field. J. G. Lister, a graduate of the Imperial College of Technology, London, England, has acted as instructor of the technical school since its organization. In order to encourage faithful work the company has this year decided to issue certificates to the men based on attendance and attention. In addition Geoffrey Porter, assistant chief engineer of the company, has offered prizes for the best kept sets of notes on the lectures.

Cincinnati Sues Cincinnati Traction Company for Franchise Tax on Income of Roads Using Its Tracks.—On Oct. 16 the city of Cincinnati brought suit in Common Pleas Court to recover from the Cincinnati Traction Company and the Cincinnati Street Railway \$20,810, claimed to be due as franchise tax, with interest, under its contract with

the roads. Two other roads use certain tracks belonging to these companies and pay 3 cents per passenger for their use. The Cincinnati Traction Company and the Cincinnati Street Railway have paid the city taxes on the amounts represented by the portion of the fares they receive, but the city now demands the tax on the amounts the leasing companies received, also. It is said that the suit was brought partially for the purpose of safeguarding the city in the adjustment of the rate of fare in 1916, the year that the adjustment is to take place under the contract between the city and the company.

Chicago Elevated Differences Being Settled in Conference.—The date for beginning the arbitration hearings in the settlement of the differences between the employees and the elevated railroads of Chicago was set for early in October. Since the decision to arbitrate was made in July the employees and the management decided that they could settle their differences without resorting to arbitration. Accordingly at a regular meeting of the elevated employees on Oct. 9, it was voted to take up the differences with the management direct. This was agreeable to the company, and such satisfactory progress has been made in disposing of the various questions in controversy that it is expected an agreement will be reached between the committee of the employees and the management during the week ended Oct. 23. The terms of settlement will then be published in the *Union Leader*, the official organ of the employees. After six days the agreement will be submitted to the men for approval.

Arbitration Declined at Oakland.—The directors of the San Francisco-Oakland Terminal Railways, Oakland, Cal., have declined to submit to arbitration the proposition from the representatives of its employees as to whether the agreement dated Oakland, Oct. 29, 1908, includes employees other than the track oilers and the platform men. G. K. Weeks, president of the company, said in a communication to the men: "What you propose to arbitrate is in no sense a grievance. It is a demand which contemplates an extension of the authority of your union far beyond the limits of the present contract. Your demand is not for an interpretation of the existing agreement, but for a new agreement that shall include under its terms all classes of employees. This matter is of such far-reaching consequence that the officers of the company cannot consent to abdicate their authority in favor of any outside arbitration committee, or anyone else not familiar with the property and the problems connected with its management." On Oct. 10 the report of the grievance committee representing the employees that "the time was not opportune for a strike" was adopted by an overwhelming vote.

Contract Award for Philadelphia Elevated Railroad Sections.—Director A. Merritt Taylor, of the Department of City Transit of Philadelphia, Pa., on the afternoon of Oct. 19 awarded to the McClintic-Marshall Company, Pittsburgh, Pa., the contract for the manufacture and erection of the steel superstructure of three of the four sections of the Frankford elevated line in Philadelphia, extending from Girard Avenue north to Unity Street, Frankford. The company's bid was \$1,455,000. The McClintic-Marshall Company also was the lowest bidder for the fourth section, from Girard Avenue south to Callowhill Street, with \$249,000, and an alternate bid of \$261,400. It is expected that this contract will be awarded in the next few days, after a decision is handed down on the removal of Reading Railway grade crossings on Front Street. This will make the company's total bid for the superstructure of the entire line, \$1,176,400. The contract provides for beginning the work on April 1, 1916, and completing it the following Oct. 31. The construction of the concrete track floor and the station buildings is not included in the contract.

PROGRAM OF ASSOCIATION MEETING

Illinois Electric Railway Association

The Illinois Electric Railway Association will meet on Oct. 29 at the La Salle Hotel, Chicago. The presentation of committee reports and a business session make up the program. The question of amalgamating the Illinois Electric Railway Association, Illinois State Electric Association and the Illinois Gas Association is to be considered.

Financial and Corporate

PARIS SUBWAY IN WAR TIME

Report for 1914 Shows Effect of Outbreak of War Upon Number of Employees, Service and Receipts

The report for 1914 of the Metropolitan Railway, which operates the subway system in Paris, France, is of exceptional interest as showing the fluctuations in the number of employees, service and receipts caused by the outbreak of the European war on Aug. 1, 1914. The year 1914 opened well and for the first seven months the results compared favorably with those of the same period of the two previous years, and the prospects were excellent when war broke out.

The subsequent general mobilization naturally depleted the staff and limited the service. By Aug. 5 2817 male employees, or 56 per cent, had been called to service, and by Sept. 1 this number was increased to 3831 or 75 per cent. Many of the services were suspended, the length of line worked being reduced from 77 km. to 41 km. and the number of stations kept open from 169 to 63. By the employment of women, the sons of men mobilized, very old and very young men, etc., however, the stations and some of the lines were gradually reopened, and by Dec. 1 the last station was in service and all lines were running from 7 a. m. to 10 p. m. With allowance made for the partial interruptions to service caused by the mobilization, the average length of line operated for the entire year was 73 km. At the end of December, 1914, the number of employees was only 3658 as compared to 5478 at the end of 1913.

The beginning of hostilities, of course, affected the receipts adversely. On Aug. 1, after the mobilization order appeared, the receipts increased to \$38,981, or 57 per cent, over the corresponding day in 1913, but on Aug. 3, with the stoppage of part of the lines, fewer trains and general paralysis of Paris life, the drop began and reached 15 per cent, as compared to this date in 1913. On Aug. 4 it was 43 per cent, on Aug. 5 50 per cent and on Aug. 9 53 per cent, the total receipts falling to \$19,592. On Aug. 15 the low point was reached with receipts of only \$7,729, a drop of 58 per cent. The gradual return to working, however, influenced the receipts, and after Aug. 20 they sensibly improved. After Aug. 30 they went up to more than \$18,111, but dropped afresh to \$10,080 until Parisians began to return in large numbers after the victory of the Marne. In September the daily average receipts were \$12,610, in October \$16,047, in November \$20,026, and in December \$22,617, as compared to \$33,860 in December, 1913.

An analysis of the results by lines and by categories of passengers showed that the class most seriously affected was the working people, who use the outside lines most in normal times. The great decrease was in the return tickets issued before 9 a. m. and used in returning mostly between 6 and 8 p. m. For instance, on Aug. 3 the number of first and second-class tickets issued was higher than for the corresponding day of 1913, but the return tickets fell off more than 50 per cent.

UTILITY DEVELOPMENT IN CALIFORNIA

The California Railroad Commission recently published a report outlining the public utility development work carried on in that State from March, 1912, when the commission assumed jurisdiction over stocks and bonds, up to September, 1915, a period of approximately three and one-half years. During this period stocks, bonds, notes and certificates amounting to \$466,000,000 were authorized. Of this amount \$175,000,000 was authorized for the payment of maturing debts; \$248,000,000 for new construction, additional development of existing utilities and new ventures, and the balance for miscellaneous purposes. The authorization for new improvements was distributed as follows: Steam railroads (including \$25,000,000 for expenditures outside of California), \$102,800,000; electric railways, \$32,500,000; gas and electric companies, \$80,000,000; water companies, \$18,500,000; telephone and telegraph companies, \$2,500,000; warehouses, \$1,600,000, and pipe lines, \$10,000,000. Approximately \$200,000,000 of the foregoing has already been expended or is in the process of expenditure.

ANNUAL REPORT

New York Railways

The comparative statement of income, profit and loss of the New York (N. Y.) Railways for the fiscal years ended June 30, 1914 and 1915, follows:

	1915	*1914	Change
Gross operating revenue.....	\$13,399,767	\$13,860,837	—\$461,070
Operating expenses	8,551,432	8,775,620	— 224,188
Net operating revenue.....	\$4,848,335	\$5,085,217	—\$236,882
Taxes	1,042,859	1,092,105	— 49,246
Income from operation.....	\$3,805,476	\$3,993,112	—\$187,636
Non-operating income.....	527,242	460,476	+ 66,766
Gross income	\$4,332,718	\$4,453,588	—\$120,870
Income deductions:			
Interest on underlying bonds, rents, etc.....	\$2,741,015	\$2,710,384	+ \$30,630
Interest on New York Railways first real estate and refunding mortgage 4 per cent bonds.....	691,538	651,838	+ 39,700
Total	\$3,432,553	\$3,362,222	+ \$70,330
Balance	\$900,165	\$1,091,366	—\$191,200
Add:			
Surplus at beginning of year as adjusted	\$232		
Addition during the year—net	61,048		
	61,280	21,544	+ 39,735
Net income—surplus available for interest on adjustment mortgage 5 per cent bonds	\$961,445	\$1,112,910	—\$151,465
Deduct:			
Interest on adjustment mortgage income bonds.....	961,381	1,112,678	— 151,297
Surplus	\$64	\$232	— \$168

*The figures for the year ended June 30, 1914, including the surplus at the beginning and end of the 1914 period, are adjusted to accord with changes in classification made during the year ended June 30, 1915, so that a proper comparison may be obtained.

The gross passenger revenue for the year was \$13,010,933, a decrease of \$410,748 or 3.06 per cent. This abnormal falling off may be attributed to the general business depression prevailing throughout the year, and to the interference with traffic resulting from subway construction. The statistics of the operating department show that the delays from causes of the latter character were 100 per cent greater than in 1914. There was also a great deal of interference by trucks and other vehicles unnecessarily blocking and using the company's tracks. With proper regulation of this traffic, street railway traffic could be facilitated by at least 10 per cent. Other street railway operating revenue was \$388,834, a decrease of \$50,323 or 11.46 per cent. This is accounted for principally by a reduction in the receipts from advertising and the sale of power.

The operating expenses totaled \$8,551,432, a decrease of \$224,188 or 2.55 per cent. The total charge to maintenance accounts for the year, including the reserve for maintenance and depreciation (equal to 20 per cent of the total operating revenue), was \$2,679,953, a decrease of \$92,214. This decrease resulted from the falling off in the total operating revenue. The amount applied to the reserve account was \$757,976, an increase of \$433,204 as compared with last year. There was actually expended during the year for the maintenance of way and structures \$1,008,579, and for the maintenance of equipment \$913,398, the total maintenance expenditures showing a decrease of \$525,418, caused in part by the necessity of deferring certain repair work until the streets approach normal conditions. The transportation expenses were \$4,344,661, a decrease of \$81,222, of which \$38,505 applied to the power supply accounts and \$42,717 to operation of cars.

During the year there was charged to operating expenses for injuries to persons and property the sum of \$975,820, which is equal to 7½ per cent of the gross passenger revenue, a decrease of \$65,687 as compared with the preceding year. This decrease was caused by the falling off in the gross passenger receipts during 1915 and the fact that the accruals for the first six months of the preceding year were based on the rate of 8 per cent and the second six months 7½ per cent of the gross passenger revenue. The actual expenditures made during the current year amounted to \$929,386, an increase of \$124,252 or 15.43

per cent over last year, while the remainder reserved was \$46,434, a decrease of \$189,939 or 80.36 per cent.

The actual disbursements for the current year and those arising out of the operations during the receivership and liquidated during this year equaled 7.2 per cent of the gross passenger revenue, compared with 6.4 per cent last year and 6.6 per cent the year before. The increase was largely caused by the liquidation of a greater volume of the accumulated liability. The experience of the company so far seems to indicate that an allowance of between 7 per cent and 8 per cent for injuries is necessary under present conditions. During the years prior to the receivership the expenditures were between 10 per cent and 11 per cent a year—a reduction of more than \$400,000 a year. Claimants succeeded in only 25 per cent of the cases during the year, as compared with 34 per cent last year. The company voluntarily settled 3594 claims for \$270,000 before suit was brought and compromised 1514 actions before trial for \$296,928, leaving as the result of contested suits 185 judgments paid to the amount of \$62,877.

The taxes assignable to street railway operations amounted to \$1,042,859, a decrease of \$49,246 or 4.51 per cent, the greater portion thereof applying to the special franchise taxes by reason of a reduction in the assessed valuation. This reduction may be attributed to the favorable results obtained in the litigation of the special franchise tax cases of the Metropolitan Street Railway decided in favor of the company in December, 1914. This year the State Board of Tax Commissioners gave full consideration to the decision in these cases, and the aggregate assessment of \$31,799,950 is considered fair. The current year is the first since 1899 in which no proceedings have been necessary to review the assessments.

During the year the company issued \$1,751,000 of first real estate and refunding mortgage 4 per cent bonds and \$4,950 of convertible 4 per cent scrip for the acquisition of 5017 of the 6000 outstanding shares of the Twenty-third Street Railway. This transaction has resulted in a net saving per annum of approximately \$13,014. The company also acquired by purchase at auction the \$2,473,400 of 4 per cent first consolidated bonds of the Central Crosstown Railroad, which were held as collateral for the latter's 5 per cent notes amounting to \$1,882,987 owned by the New York Railways.

The following table shows some of the comparative operating statistics for the years ended June 30, 1914 and 1915:

	1915	1914	Change
Rates per car mile:			
Total revenue from operations	38.40c.	40.10c.	—1.70c.
Maintenance of way and structures:			
Expended	2.89c.	4.67c.	—1.78c.
Reserved	1.64	.06	+1.58
Maintenance of equipment:			
Expended	2.62	2.41	+ .21
Reserved53	.88	— .35
Operation of power plant	2.66	2.80	— .14

Car miles	34,891,203	34,564,090	+327,113

NORTHERN ELECTRIC PLAN COMPLETED

Full Details of Reorganization Plan That Has Been Approved by Representatives of Parties in Interest

The reorganization plan for the Northern Electric Railway, Chico, Col., and its allied corporations, which, as announced in the *ELECTRIC RAILWAY JOURNAL* of Oct. 2, has been signed by creditors' representatives, by protective committees for stockholders and bondholders, by the Sloss trustees and certain San Francisco banks, has now reached its final stages. Deposit of securities, etc., is being urged, and the plan will now be submitted to the California Railroad Commission for its approval. As stated in last week's issue, the time for owner or pledgees of stock and creditors to assent to the agreement is limited to Nov. 15.

The main feature of the reorganization plan, which was described as to preliminary details in the issue of July 10, is that the rights of the bondholders and creditors of the railway companies are substantially preserved in effect for a period of at least five years from July 1, 1915, during which time it is hoped that increase in population and improved business conditions throughout the territory covered will materially increase the revenues and give the roads a chance to work out the payment of all claims. This extension of time is secured without the creditors being called upon to make any advances of money.

A new corporation is to be formed with a capital stock of \$2,000,000 to take over, after foreclosure of the various mortgages, all the properties of the Northern Electric Railway, Northern Electric Company, Sacramento & Woodland Railroad and the Northern Electric Railway—Marysville & Colusa Branch. There will be an issue of \$500,000 of first mortgage twenty-year bonds, which will be used only for the purpose of discharging prior or superior liens, repairs to or re-construction of the roadbed, purchase of rolling stock and other equipment, compensation of receiver and his attorneys, expenses of reorganization, etc. In addition the new company will have an issue of \$5,300,000 of general mortgage 5 per cent thirty-year bonds, interest for first five years payable annually and only from the net earnings and to the extent of such net earnings, at a rate not exceeding 5 per cent per annum non-cumulative. These bonds will be exchanged, bond for bond, for bonds held by the owners or pledgees of the bonds of the Northern Electric Company, Sacramento & Woodland Railroad, Marysville & Colusa Branch and Chico Electric Railway. Another issue of \$7,000,000 of 5 per cent thirty-year income bonds, interest payable annually only from the net earnings and after the payment of interest on the outstanding prior bonds, will be exchanged, bond for bond, for first consolidated mortgage 5 per cent ten-year gold bonds of the Northern Electric Railway. About \$450,000 of these bonds will be pledged to secure the debts of the unsecured floating debt creditors.

The new corporation will assume and agree to pay each and all of the admitted debts of the Northern Electric Railway and its affiliated companies. Creditors may, if they wish, after the new company is incorporated, exchange their present notes for new notes of the new corporation. W. P. Hammon, E. J. de Sabla, Jr. and E. R. Lilienthal will agree to be bound the same as they now are for notes made, endorsed or guaranteed by them and will waive the right to plead the statute of limitations for the period of six years.

The Sloss Corporation and Sloss Securities Company will transfer \$500,000 in cash or securities to the new corporation. This will constitute a fund to be used during the first five years to pay to the holders of promissory notes made or endorsed by Leon Sloss or Louis Sloss and secured, under the plan, by general mortgage bonds, interest upon such bonds to the extent of the deficiency, if any, between the interest which the new corporation may pay out of its income and the full 5 per cent interest provided for by the bonds; also to pay the interest upon the promissory notes due and unpaid on July 1, 1915. At the end of five years any remainder of this fund will be used for the retirement of outstanding first mortgage bonds and the balance, if any, will be distributed pro rata to the other creditors holding notes made or endorsed by Leon Sloss or Louis Sloss. Sloss Securities Company will cancel and discharge promissory notes and other claims and demands which that company

holds against the railway companies to the extent of about \$1,700,000.

In consideration of the \$500,000 to be so paid over to the new corporation and the cancellation of such claims and demands, all of the railway creditors will release the Sloss interests from further liability to them, except that the present unsecured floating debt creditors will retain their rights against the Slosses as stockholders of the present companies. W. P. Hammon, E. J. de Sabla, Jr. and E. R. Lilienthal will each be offered the privilege, for a period of three years, which the new corporation may extend for another year, of being likewise released from all liability upon notes made, endorsed or guaranteed by them, upon the payment of \$500,000. In the event of such payment one-half of the amount so paid will be used for the purpose of redeeming any outstanding first mortgage bonds, and the other half will be divided among creditors other than underlying bondholders as security for claims.

All of the stock of the new corporation will be placed in trust with the Union Trust Company, San Francisco, for five years, with the power of selling the same for not less than \$2,000,000. In case of such sale the money will be distributed pro rata among the creditors other than those whose claims are secured by the underlying bonds. The new corporation will have a board of fourteen directors, four of whom will be selected by the owners of the general mortgage bonds, four by the pledgees of general mortgage bonds, four by owners and pledgees of income bonds, one by the unsecured creditors, and the remaining one by the note endorsers. While the stock is so held in trust, the trust company will vote the same in accordance with the instructions of the bondholders and creditors. If the stock shall not be sold during the period of five years, it shall then be sold at public auction and the net proceeds distributed among the creditors, or it shall be otherwise disposed of as a majority of the creditors may then determine. If no sale or other distribution is made, the stock itself will be distributed among the creditors, other than those holding underlying bonds as security, and the creditors will then own and operate the road.

THIRD AVENUE PAYS DIVIDEND

Quarterly Dividend of 1 Per Cent Is First Since 1907 on Stock of Reorganized Company

The directors of the Third Avenue Railway, New York, N. Y., on Oct. 15 declared a quarterly dividend of 1 per cent, payable on Jan. 1 to stockholders of record on Dec. 15. According to reports, it is the intention of the directors to continue the dividends regularly and thus put the road on a 4 per cent basis.

The present dividend is the first paid on the stock of the reorganized Third Avenue Railway. The old Third Avenue Railroad, prior to 1889, paid dividends for a long time at the rate of 7 per cent. When the road was leased to the Metropolitan Street Railway dividends continued at the rate of 5 per cent until October, 1907, when they were suspended by the receiver for the Metropolitan company. F. W. Whitridge, president of the new company, maintained that there should be no dividends until the property had been thoroughly built up and until a proper surplus had been laid aside for the future welfare of the road.

Ever since the new management went into office on Jan. 1, 1907, there has been a clamor among stockholders for dividends. President Whitridge always reasserted his intention to reconstruct the road and put every cent back into the property in order to perfect the operating conditions. Early this year a committee of stockholders appointed by President Whitridge at the latest annual meeting made an investigation which resulted in a recommendation for a quarterly dividend of 1 per cent. Later a sub-committee of the board of directors was appointed to consider the future policy of the company as regards dividends and outlays for improvements, but this sub-committee on July 14 announced that the dividend question would be left for the full board of directors to decide in the autumn. The present declaration is now the outcome.

It was announced after the directors' meeting that the \$2,020,000 of 4 per cent Third Avenue Railway bonds re-

cently authorized by the Public Service Commission for the First District of New York had been sold to the Central Trust Company at 80. The company reserves the right to repurchase the bonds at any time at the same price and accrued interest.

Albuquerque (N. Mex.) Traction Company.—The holdings of the Albuquerque Traction Company were purchased on Oct. 1 at foreclosure sale by H. A. Jastro for \$50,000. The following day the holdings were taken over by the newly-organized City Electric Company, of which George Roslington, the receiver of the old company, is president. Mr. Jastro, who was the former president of the old company, is a bondholder but not a stockholder in the new company. The new company has purchased seven pay-as-you-enter cars from the St. Louis Car Company, and it is reported that various other improvements are to be made. On Oct. 3 Mr. Roslington's final report as receiver was approved by the court. This showed receipts of \$13,831 since May 8 and disbursements of \$17,379. The property, however, was more than self-supporting until a carhouse fire put all but two cars out of operation.

Brooklyn (N. Y.) Rapid Transit Company.—The Brooklyn Rapid Transit Company through one of its subsidiaries, the South Brooklyn Railway, has applied to the Public Service Commission for the First District of New York for permission to purchase the majority stock of the Prospect Park road at \$200 a share for 1768½ shares, or \$353,700 in all. This stock is held by the Long Island Railroad, which has been leasing the right-of-way to the rapid transit company for \$45,000 a year. The application is opposed by minority stockholders, who state that this rental is the company's only source of revenue and insist that the commission should require the Brooklyn Rapid Transit Company to purchase all the stock at a uniform price.

Denver (Col.) Tramway.—The recent suspension of the quarterly dividend of the Denver & Northwestern Railway, announced in the *ELECTRIC RAILWAY JOURNAL* of Oct. 2, was the result of a similar suspension by the Denver Tramway, the operating subsidiary of the former company. According to a statement sent out by the board of directors to the stockholders of the two companies, there was during the three months ended Sept. 30, 1915, a decrease of \$57,211 in tramway gross earnings, a decrease of \$19,835 in operating expenses, and a decrease of \$34,623 in net income applicable to dividends and sinking fund requirements as compared with the corresponding period of last year. It has been necessary to expend a considerable sum of money in new construction and proper maintenance of the company's property, and owing to world-wide unfavorable financial conditions the directors deemed it not advisable to sell at a sacrifice any of the bonds in the treasury to replace these funds taken from the working capital. The board of directors therefore decided that the interests of the operating company, as well as its bondholders and stockholders, would be better conserved by discontinuing, for the present, any dividends, thereby strengthening the company's cash position. Under these circumstances the Denver & Northwestern Railway could not declare its quarterly dividend.

Fort Wayne & Springfield Railway, Decatur, Ind.—Fannie R. Armstrong et al. have filed a suit with Judge Anderson of the Federal Court, asking that a judgment of \$4,750 be rendered for conversion of bonds, with interest from June 4, 1911, that the judgment be declared a prior and preferential claim against all the property of the Fort Wayne & Springfield Railway, and that the court resume jurisdiction over the line and appoint a new receiver to take charge of the property and offer it for sale to satisfy claims of the plaintiffs. As noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 28, this property was sold at foreclosure sale on Aug. 12. Latest advices, however, are to the effect that the company will be resold at a private sale on Oct. 25, under an order issued by Special Judge Hartford, Portland. The court refused the petition of Lizette Dirksen and Emma Gerke, who purchased the road at the Aug. 12 sale, to extend for thirty days the time for making the final payment of \$78,000. Their initial deposit of \$5,000 was forfeited. It is again reported that attorneys representing Fred A. Dolph of Chicago, who recently announced his intention to electrify the purchased steam road

between Huntington and Bluffton, Ind., intend to bid in the electric line at the new sale.

Gary & Interurban Railroad, Gary, Ind.—Suit was recently filed in the Federal Court of Indianapolis, Ind., by the Central Trust Company, Chicago, to foreclose on the first refunding \$10,000,000 mortgage of the Gary & Interurban Railroad. Defaulted interest on \$1,000,000 of this is said to be the direct cause of foreclosure. The company's receipts were affected by jitney bus competition, beginning when the large industries in the Gary district resumed full operation after the recent business depression. The court appointed Charles D. Davidson of Gary as receiver.

Havana Electric Railway, Light & Power Company, Havana, Cuba.—A semi-annual dividend of 3 per cent has been declared on the \$15,000,000 of common stock of the Havana Electric Railway, Light & Power Company, payable on Nov. 13 to holders of record on Oct. 23. This compares with 2½ per cent paid last May and 5 per cent during the calendar year 1914. A dividend of 3 per cent this year was also declared on the preferred stock.

New York (N. Y.) Railways.—The committee of Frank L. Hall, Charles P. Howland and George B. Leighton, representing the holders of the adjustment income 5 per cent bonds of the New York Railways, has, in connection with its call for proxies for the annual meeting on Dec. 6, noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, issued a circular stating that counsel have been engaged in the preparation of suit for the recovery of the \$1,500,000 shortage from the full interest on the bonds up to and including the coupons of April 1, 1915, and that the suit is now in shape to be actively pressed at the coming fall term of the courts. In the meantime the committee has been conducting an investigation of the company's affairs, which has convinced it that the system of accounting adopted by the company is not in accordance with the terms of the deed of trust, and that if the accounts were properly kept the bonds would be assured of their full interest.

New York (N. Y.) Municipal Railway Corporation.—The New York Municipal Railway Corporation, the operating subsidiary of the Brooklyn Rapid Transit Company's new subway lines, has applied to the Public Service Commission for the First District of New York for permission to issue \$20,000,000 of 5 per cent sinking-fund gold bonds under its first mortgage dated July 1, 1912. These bonds, with \$40,000,000 previously authorized, will form part of the collateral for the issue of \$60,000,000 of Brooklyn Rapid Transit Company's six-year 5 per cent secured gold notes, the final \$20,000,000 of which were recently sold, as noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9 and Oct. 16. The proceeds of the latter are to be applied as follows: In the discharge of obligations already incurred under the dual subway system, \$3,457,520; cost of equipment of rapid transit systems, \$7,680,000; cost of reconstruction and extension of lines of New York Consolidated Railway, \$4,030,620; toward the cost of plant construction and equipment of elevated tracks, \$2,620,000; for the extension of present lines, \$1,611,860, and for discount, \$600,000 (to be amortized out of earnings).

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The San Francisco-Oakland Terminal Railways is now paying, through its regular agencies, the interest on San Francisco, Oakland & San José Railway first mortgage 5 per cent bonds, which came due on July 2 but was deferred for lack of funds. Some time ago the company announced that interest on the bonds of its constituent corporations, coming due between July 1 and Dec. 31, 1915, would be paid as sufficient funds could be accumulated from current earnings, payment to be made in the order of seniority of the bond issues. Other payments previously made in accordance with this policy were noted in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11.

Tri-State Railway & Electric Company, East Liverpool, Ohio.—The *ELECTRIC RAILWAY JOURNAL* has secured official information discountenancing the recent report in financial circles that the properties owned by the Tri-State Railway & Electric Company were bid in by the bondholders' committee at a postponed foreclosure sale on May 27 and subsequently sold to the Duquesne Light Company, Pittsburgh, Pa., or interests identified with it. The facts

are that during July, 1915, the Virginia & Ohio Securities Corporation acquired the capital stocks of all the companies formerly owned by the Tri-State Railway & Electric Company and purchased at foreclosure sale by the bondholders' committee of that company. The line in Steubenville was deeded to the Steubenville Railway, all the stock of which is owned by the Virginia & Ohio Securities Corporation. These changes were noted at the time in the ELECTRIC RAILWAY JOURNAL of July 24 and Aug. 21. None of the properties were sold to the Duquesne Light Company, and the control of the Virginia & Ohio Securities Corporation does not lie with any of the Pittsburgh companies. The Virginia & Ohio Securities Corporation has no bonds outstanding, but has issued and outstanding \$1,250,000 par value of common stock and \$1,000,000 par value of 7 per cent cumulative preferred stock. The properties owned or controlled by this company are as follows: Steubenville, Wellsburg & Weirton Railway, Wellsburg Electric Light, Heat & Power Company, Hancock County Electric Company, Steubenville Railway, Steubenville Bridge Company, Beaver County Light Company and Midland Electric Light & Power Company.

DIVIDENDS DECLARED

American Railways, Philadelphia, Pa., quarterly, 1¼ per cent, preferred.

Columbus Railway, Power & Light Company, Columbus, Ohio, quarterly, 1¼ per cent, preferred Series B; quarterly, 1¼ per cent, common.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich., quarterly, 1½ per cent, preferred; quarterly, 1 per cent, common.

Cumberland County Power & Light Company, Portland, Me., quarterly, 1½ per cent, preferred.

Grand Rapids (Mich.) Railway, quarterly, 1¼ per cent, preferred.

Havana Electric Railway, Light & Power Company, Havana, Cuba, 3 per cent, preferred; 3 per cent, common.

Jacksonville (Fla.) Traction Company, quarterly, 75 cents, preferred.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., quarterly, 1½ per cent, preferred.

Third Avenue Railway, New York, N. Y., 1 per cent.

Traffic and Transportation

JITNEY JOTTINGS

The Railroad Commission of California Has No Jurisdiction Over Motor Bus—First jitney Application Passed

Upon by New York Commission

The Railroad Commission of California has issued an order declaring that it could not exercise jurisdiction over motor-bus and auto-stage lines. The same decision was rendered in the case of the Western Association of Short Line Railroads against the Wichita Transportation Company and the case of the United Railroads, San Francisco, against the Peninsula Rapid Transit Company. The first of these cases dealt with the auto stages running from San Diego, Cal., to Imperial Valley points, and the second with the auto-bus lines operating between San Francisco and San Mateo. The decision draws particular attention to the fact that "every common carrier" is declared to be a public utility and points out that "it is unquestionably true that the company is a common carrier at common law, and that the constitution has declared that the common carrier is a public utility, but it is equally true that this section of the constitution distinctly declares that corporations and persons declared to be public utilities shall be subject only to such control and regulation by the Railroad Commission 'as may be provided by the Legislature.' It is distinctly provided that the Railroad Commission shall have and exercise 'such power and jurisdiction' to supervise and regulate public utilities 'as shall be conferred upon them by the Legislature.'" It is the opinion of the Railroad Commission that the Legislature did not confer this jurisdiction.

In an opinion rendered on Oct. 22 by Commissioner William Temple Emmet, the Public Service Commission for the Second District of New York has decided the first application for a certificate of convenience and necessity for a jitney bus line under the law passed by the last Legislature. Commissioner Emmet's opinion lays down in broad lines the principles which govern the commission in this and future applications, though declaring expressly that each case will be decided on its merits. The present application, however, that of William B. Gray for authorization of six routes in New Rochelle, is characterized as one so typical as to afford most favorable opportunity for discussion of the problem in general. Commissioner Emmet's opinion is of some length, he says, in order that future applicants may be guided by the principles there set down. The commission grants certificates to four of the six routes provided for in the franchise from the municipality on which the application is based and refuses two others. The four routes authorized run on the same streets with existing electric railway lines only for the short distances necessary to reach the New Haven Railroad station, whereas the routes for which certificates were refused were for the most part on the same streets with the existing trolley lines.

The Pennsylvania Public Service Commission has now actively started hearings on the status of the jitneys in that State. Argument is being heard before the commission in the case begun by the Scranton Traction Company against three proprietors of jitneys running between Scranton and Carbondale, upon the decision of which rests the fate of the jitney business in Pennsylvania. The company alleges that the jitney owners should be taxed the same as any other corporation and should obtain a certificate of public convenience similar to other public service corporations. C. L. S. Tingley, vice-president of the American Railways, of which the Scranton system is a part, and H. B. Gill, Philadelphia, counsel of the company, are arguing the case for the company.

Jitney operators of Rochester, N. Y., have presented to the Common Council a petition to do business in the streets of the city, according to the requirements of the jitney law, which compels them to file such a petition and then to make application to the Public Service Commission for a certificate of necessity and convenience.

The City Council of Atchison, Kan., has passed an ordinance regulating jitneys. It provides for the examination of drivers, a license of \$10 a year and bond of \$1,000.

FARE INCREASE ASKED IN MILWAUKEE

Company Outlines Conditions That Make Increase in Fares Imperative

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has entered a plea for an increase in fares. In "Plain Talks to Our Patrons," the first of a series of advertisements in the daily newspapers published on Oct. 16, the public is urged to aid in obtaining a higher rate of fare and in removing burdensome restrictions. Ten months ago the company hoped to be able to do certain things, or most of them, out of its earnings at existing rates. It now finds that it can not do these things. Conditions affecting the business have changed. New factors have appeared that cut earnings and bid fair to cut them for a long time to come far below the point at which the company can do what it wished to do. The company said in part:

"If we are to do these things, or any of them, we must earn more or spend less. If we earn more, we can do all of them. If we merely spend less, we can do only one of them. That one is, the payment of a fair return on the capital invested in the business. **THIS IS THE FIRST NECESSITY OF ANY BIG BUSINESS THAT HAS TO BORROW MONEY TO MAKE EXTENSIONS OR LARGE-SCALE BETTERMENTS OF ANY KIND. IF IT DOESN'T PAY A FAIR RETURN ON CAPITAL ALREADY ENLISTED, IT CAN'T GET ADDITIONAL CAPITAL WHEN IT NEEDS MORE.**

"Our alternatives appear to be:

"1. To reduce the service; or,

"2. To ask the Wisconsin Railroad Commission to: (a) let us stop selling car tickets at six for 25 cents and 25 for \$1 and charge a flat 5-cent cash fare in the city; or (b) let us charge 1 cent for a transfer and draw in the city one-fare zone to create one more suburban 2-cent zone, or,

"3. To ask the proper authorities to relieve us of heavy and unfair charges for paving, cleaning and sprinkling streets; or,

"4. To keep on operating our lines for a return which each year is smaller, which is away below the 'fair return' State regulation entitles us to, and which in the fiscal year 1915 has come very near the vanishing point.

"**NOBODY WANTS TO SEE SERVICE REDUCED.** The whole tendency of public service is toward more liberal standards of loading and headway of cars. This costs money and most of the public is entirely willing to pay for it. Milwaukee is growing and needs not less but more street railway service.

"So, if any relief is to be had, it must come from higher rates and lower taxes. Here are the main facts we face to-day:

"1—DURING THE PAST FOUR YEARS MILWAUKEE'S STREET RAILWAYS HAVE EARNED NET \$494,797.15 LESS THAN A FAIR RETURN OF 7½ PER CENT ON THE RAILROAD COMMISSION'S LOW RATE VALUATION.

"2—DURING THOSE FOUR YEARS THEY HAVE EARNED NET \$1,672,053.67 LESS THAN A FAIR RETURN ON THEIR ACTUAL CASH INVESTMENT.

"3—THAT HUGE DEFICIT IN NET EARNINGS, WORSE EACH YEAR, MENACES THE COMPANY'S CREDIT AND PREVENTS ANY FURTHER EXTENSIONS OR BETTERMENTS AT OUR COST.

"What we want, then, is relief from losing rates, unfair taxes and public burdens foreign to street railway business. And we want our patrons, if you feel that our request is a fair one, to back us up in getting this relief. We are going to give you facts and figures proving we are entitled to it; that it is as much in yours and Milwaukee's interest as in our own.

"We are public servants chartered to do a public service. You are the State. Through your State government, you fix a top limit to what we can earn in any one year. You don't let ours, like other businesses chartered by the State, earn a big profit one year to offset little or no profit—or a net loss—in dull years.

"WHEN YOU DO THAT YOU BIND YOURSELVES MORALLY TO LET US ADAPT OUR RATES TO CHANGING CONDITIONS, SO THAT EACH YEAR WE

SHALL EARN THE 7½ PER CENT YOUR RAILROAD COMMISSION AND YOUR COURTS HAVE AGREED IS NECESSARY TO GIVE GOOD SERVICE AND MAINTAIN THE COMPANY'S CREDIT.

"OUR CITY AND SUBURBAN LINES HAVE NOT EARNED THAT 'FAIR RETURN' FOR FOUR YEARS PAST. THEIR NET RETURN HAS BEEN STEADILY FALLING. THERE IS NOT A CHANCE THAT THEY CAN EARN IT HEREAFTER, UNDER EXISTING RATES, TAXES, INCREASING WAGES AND OTHER BURDENS.

"You have said, by your public agencies, that we are entitled to earn it, and must earn it in order to give good service. We are now asking you to help us get changes that will let us earn it."

HEARING IN WISCONSIN ON OPERATING RULES

The Railroad Commission of Wisconsin set Oct. 21 as the day for a formal hearing on the subject of operating rules and other regulations affecting service and safety on all electric railways, both city and interurban, in Wisconsin. The standard code of rules for interurban operation and the standard code of rules for city operation adopted by the American Electric Railway Association have been suggested by the commission as the basis of the discussion. Particular attention will be directed to that portion of the rules in regard to flagging at railroad crossings, the display of signals and markers, operation of interurban trains by written order, etc. Other matters to be taken up at the hearing will be the use of spring switches and switch targets on interurban lines, height of car steps, width of doors and aisles, use of one-man cars, use of pilots or fenders for interurban cars and use of fenders or life guards for city cars, and the type of gates and fences along private right-of-way.

MOTOR BUS FEEDER FOR SEATTLE MUNICIPAL RAILWAY

Plans for an auto-bus feeder line for the Seattle Municipal Railway, recently authorized by the City Council despite the Mayor's veto, were outlined briefly in the ELECTRIC RAILWAY JOURNAL for Oct. 2, 1915, and further details are now available. The contract will allow the operator of the auto-bus line 3 cents on every transfer from the railway. The length of haul on the bus line is 1.3 miles, this covering a ride from the north terminus of Division "A" of the Municipal Railway to Ballard, a suburb of Seattle. The bus receipts, therefore, will approximate 2.3 cents per passenger mile. The remaining 2 cents of the 5-cent fare that will be charged on the Municipal Railway for transfer passengers will cover an average haul on the railway of 2.75 miles, giving receipts of only 0.73 cents per passenger mile.

The present standard fare on the Seattle Municipal Railway approximates 4 cents, tickets being sold six for 25 cents and twenty-five for \$1, the same rate that is charged by the Puget Sound Traction, Light & Power Company. This rate will be maintained after bus operation commences, but the 4-cent tickets will not carry the transfer privilege. The maximum length of haul for the railway is 4 miles, although the average haul is 2.75 miles.

The fare on the buses will be 5 cents either for transfer passengers or for those who do not wish to transfer. Apparently, but one bus is to be installed, as the headway is to be twenty minutes, the round trip distance being 2.6 miles. Bus service is to be discontinued daily at 7 p. m. The contract between the bus line and the city of Seattle will extend for a period of one year and can be terminated upon thirty days' notice by either party. The bus operator will be required to file with the city a \$10,000 bond to indemnify passengers on the bus who may sustain injuries. Tickets and transfers used in connection with the joint operation will be provided by the bus operator for the bus line and by the city for its railway line, an accounting being made once a month. The city is to refrain from making agreements with any other bus company during the life of the present contract, which has had its details practically decided by the Board of Public Works of Seattle, although at the present time the contract has not been formally executed.

In view of the relatively favorable terms of the contract from the standpoint of the bus operator, these having been attained at the expense of the railway, the question arises as to why the city does not install a bus line of its own. In answer to this it is reported that the city has neither the funds nor the authorization to engage in the operation of a bus line as a feeder for the municipal railway line, the voters refusing at an election on March 2, 1915, to sanction propositions which called for the improvement and extension of the municipal railway service. These propositions were: The purchase of auto buses to connect Divisions "A" and "C" of the municipal line, involving an expense of not more than \$50,000; and as an alternative, a proposition to extend Division "A" of the municipal railway, involving an expense not to exceed \$100,000. It may be said that the jitney-bus lines now in operation in Seattle do not compete with the present municipal line as the territory served by the latter is unpaved and is not considered profitable territory by bus operators.

CHICAGO OPERATING ORDER QUESTIONED

The local transportation committee of the Chicago City Council has directed the corporation counsel to institute court proceedings to test the right of the Public Utilities Commission of Illinois relative to the "seats for all" order and trailers, reviewed in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, page 775. To determine just what the rights of the Chicago Surface Lines are under the 1907 ordinances, L. A. Busby, president of the company, has sent the following letter to the local transportation committee of the City Council:

"We hand you herewith a copy of the opinion and order of the State Public Utilities Commission, dated Sept. 29, 1915, with reference to the Chicago Surface Lines. In transmitting a copy of this opinion and order we wish to call your attention to the fact that the order is not only in direct conflict with important provisions of the traction ordinances, but purports to assume jurisdiction of the commission over the street railways to the exclusion of control by the city. We regard the traction ordinances of 1907 as constituting valid and binding contracts between the city and the companies. The conflict of authority occasioned by this order presents some serious problems with reference to which we should be advised as to the city's views and position."

W. W. Gurley, legal adviser of the Chicago Surface Lines, is reported to have said:

"We expect to comply with the 1907 ordinance obligations. We consider the ordinances to be a contract. Trailers are prohibited by the ordinances and we are not going to put on trailers."

Head-on Collision at Adrian, Mich.—Eighteen persons were injured in a head-on collision between two cars on the Toledo & Western Railroad near Adrian, Mich., on the night of Oct. 14.

Increase in Syracuse Suburban Fare Postponed.—The Public Service Commission for the Second District of New York has suspended the proposed increases in fare on the Syracuse & Suburban Railroad until Dec. 1. A date for a hearing will be set at a time convenient to all the parties concerned.

Fares Discussed by Massachusetts Street Railway Association.—R. W. Perkins, president of the Shore Line Electric Railway, Norwich, Conn., addressed the Massachusetts Street Railway Association on "Zone Systems of Fare Collection" at the regular monthly meeting at Young's Hotel, Boston, on Oct. 13. President D. A. Belden occupied the chair.

First Aid Courses in British Columbia.—Organization for first aid work among the employees of the British Columbia Electric Railway, Vancouver, B. C., is being effected. Last year ninety men were enrolled in the three first aid classes, a large number of whom completed the course and received their St. John ambulance certificate. The first aid movement has been made to include all of the employees of the company.

Score Hurt on Staten Island.—A car of the Staten Island

Midland Railway, New York, N. Y., bound for St. George, became unmanageable on Oct. 13 on the steep grade of Wright Street, Stapleton, backed down the hill with increasing momentum, and crashed into another crowded car which was rounding the curve from Canal Street. The impact drove the second car into a third which was following it. More than twenty people were injured.

Rear-end Collision in Brooklyn.—Two trains of the Brooklyn (N. Y.) Rapid Transit Company collided in the rush hour on the evening of Oct. 18 in the tunnel on the Manhattan side of the Woodruff Avenue Station in Flatbush. Twenty-five persons were injured. The first train had been brought to a sudden stop just before the crash through the application of the emergency brakes by a passenger whose identity the police are seeking to establish.

Reduction in Fare Asked.—Application has been made to the Public Service Commission of Missouri asking for an order requiring the Metropolitan Street Railway, Kansas City, to put in a 5-cent fare between the western limits of Independence and Fifteenth Street and Grand Avenue, Kansas City. This involves a trip of 12 miles, according to the petition. It is contended that the company now gives transfers for 20-mile trips between Kansas City points.

Experience Ordinance Passed in Cincinnati.—The City Council of Cincinnati, Ohio, on Sept. 28, passed an ordinance which requires that all new motormen and conductors shall have at least ten days' instruction on cars in Cincinnati before they are allowed to take charge of city or interurban cars. This experience must be had immediately preceding the date of employment and under a conductor or motorman who shall have had at least three years' experience on street cars of Cincinnati, one year of which shall have been immediately preceding the date of giving such instruction.

Trenton Fare Hearing Oct. 25.—The Trenton & Mercer County Traction Corporation, Trenton, N. J., appeared before the Board of Public Utility Commissioners of New Jersey on Oct. 19 to defend the proceedings in which it is sought to make the temporary order of suspension in the fare case permanent. It was decided to begin the hearing on Oct. 25. The United States District Court recently decided to recognize the jurisdiction of the Board of Public Utility Commissioners in suspending the proposed increase of rates in Trenton by the elimination by the Trenton & Mercer County Traction Corporation of its six-for-a-quarter tickets.

Reduction in Fare Granted in One Case, Refused in Another.—A reduction of 5 cents in the one-way cash fare from Jefferson Street station in Portland to Garden Home over the Oregon Electric Railway has been ordered by the Public Service Commission of Oregon. The fare now will be 15 cents. From Capitol Hill to Garden Home the one-way cash fare was cut from 15 cents to 10 cents, while the fare from Portland to Greenburg was lowered from 30 cents to 25 cents. The commission has dismissed the complaint for a cut in rates from Jefferson Street station to Tualatin, Metzger and Beaverton, and to these stations from Capitol Hill. It found the present fare reasonable in this instance. Estimating the cost of reproducing new the Oregon Electric system, the commission found, would involve an expenditure of \$12,667,001.

Washington Company Plans Fifteenth Christmas Entertainment.—Through President Clarence P. King of the Washington Railway & Electric Company, Washington, D. C., and subsidiaries, including the Potomac Electric Company, it is announced that at a meeting of the board of directors it was decided to again offer the children of employees of all interested companies the annual Christmas entertainment, making the fifteenth year of the event without interruption. The performance will take place a few days after Christmas Day at the New National Theater. As in the past, special cars will be provided to transport the youngsters to and from the theater free and at the conclusion of the entertainment suitable holiday gifts will be distributed. The purchasing committee will make all purchases of gifts from the local merchants. It is expected that more than 1800 children will be in attendance.

Bay State Street Railway Opens Fare Publicity Campaign.—In connection with the forthcoming hearings before the Massachusetts Public Service Commission relative to the proposed fare increase on the Bay State Street Railway the company has begun a publicity campaign in the Boston dailies, in dailies printed in important cities on its lines, and in selected weeklies, to set forth the fundamental necessity of a rate revision. The first statement, printed on Oct. 14, shows in tabular form the increased cost of food, clothing, coal, house furnishings and building materials in the past twenty years, the average being 45 per cent above prices in effect in 1895. All prices are shown on a 5-cent basis, and attention is called to the fact that the company's fare has remained stationary throughout the entire period, although the road is subject to these increased expenditures, even if indirectly, in certain cases.

New Downtown Loops Proposed for St. Louis.—The Board of Public Service of St. Louis announced recently that following a series of conferences with officials of the United Railways three street railway lines will be eliminated and tied to other lines, the dangerous curve of the Hodiament line at Thirteenth and Locust Streets will be abolished, and a system of new loops, costing \$125,000, in the downtown district, will be constructed by the United Railways, at its own expense. The report of Charles S. Butts, chief assistant engineer under Director of Public Utilities Hooke, declares that officials of the United Railways have worked in harmony with the Department of Public Utilities in bringing about these betterments, and that further conferences will be held to consider extensions to outlying districts, the straightening out of some of the present lines, and the elimination of tracks now considered unnecessary and useless for adequate service.

Educational Addresses Started in New Albany.—In connection with the safety-first work of the Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company, New Albany, Ind., a course of educational addresses has been arranged by Robert Hutchens, who is looking after this work for the companies. Heads of departments of the companies appear at the regular meetings and discuss matters which are under their control. At the last meeting, held recently, Robert G. Gordon, attorney in Louisville for the companies, addressed the members of the organization in New Albany on the legal status of the electric railroads and their employees. He went into detail as to the responsibilities and the liabilities of the company and its employees and discussed the question of what was expected of the men in cases of accidents and when they were summoned to court. The purpose of this series of addresses is to give the trainmen of the two companies a comprehensive grasp of the whole enterprise so that they will be able more readily to appreciate their individual relations to the whole.

Transfer on a Transfer Denied in Albany.—On the opinion of Seymour Van Santvoord, chairman, the Public Service Commission for the Second District of New York has again decided that it cannot compel the United Traction Company, Albany, to give a "transfer upon a transfer" on a trip between Albany and Troy, where a passenger requires the use of a line in each city as well as the interurban line. He points out that while the present transfer rules on the Troy-Albany line, as they enable a passenger to ride approximately 20 miles for 15 cents, are not unjust, there should be some provision for a limited use of transfers within restricted zones so that passengers might make use of lines in both cities for short distances without the payment of an extra 5-cent fare after paying the 10-cent fare between the two. The decision now rendered comes from the reopening of the old complaint of William S. Lodge and others and the consolidation of all the cases connected with the Troy Road transfer situation. The opinion says that this reopening was not the result of change in the personnel of the commission, but that it was due to possible changes in the circumstances of the case since Commissioner Decker decided it five years ago. The commission finds, however, that Mr. Decker's opinion then rendered still holds good, but in rendering its present decision expressly reserves the privilege of reopening the case again should circumstances again seem to demand it.

Personal Mention

Mr. George McAneny, president of the Board of Aldermen of New York and formerly borough president of Manhattan, is to retire on Jan. 1 to become associated with the New York Times. It was as head of the transit committee of the Board of Estimate that Mr. McAneny did his most notable public work, co-operating with the Public Service Commission for the First District of New York in the successful effort to secure the dual subway system now under construction and involving an expenditure of more than \$350,000,000 by the Interborough Rapid Transit Company, the Brooklyn Rapid Transit System and the city.

Mr. A. J. Purinton, formerly general superintendent of the East St. Louis & Suburban Railway, East St. Louis, Ill., has been appointed general superintendent of the Atlantic City & Shore Railroad, Atlantic City, N. J., to succeed Mr. George F. Faher, resigned. In 1910 Mr. Purinton resigned as manager of the Toledo & Chicago Interurban Railway, now the Fort Wayne & Northwestern Railway, to become general superintendent of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., where he remained until 1912, when he was appointed general superintendent of the East St. Louis & Suburban Railway Company, operating more than 190 miles of electric railway in East St. Louis, opposite St. Louis, Mo., and elsewhere in southern Illinois.

Mr. George F. Faber has resigned as general superintendent of the Atlantic City & Shore Railroad, Atlantic City, N. J. Mr. Faber began his railroad career with the Pennsylvania Railroad as a clerk in the superintendent's office, where he served from 1890 to 1892. He next became connected with the accounting department of the East Cleveland Railroad. From 1894 to 1901 he was associated with the Warner & Swasey Company, Cleveland, Ohio, but resigned from this company to re-enter the electric railway field with the so-called Appleyard lines in Ohio. Mr. Faber next accepted the position of superintendent of the Elgin-Belvidere Electric Railway, then under construction. He subsequently became general superintendent of the Western Ohio Railway, Lima, Ohio. Early in 1909 he accepted the position of traffic manager of the Chicago, Lake Shore & South Bend Railway, and in August, 1910, was appointed superintendent of transportation of the Michigan United Railway, now the Michigan United Traction Company. He has been connected with the Atlantic City & Shore Railroad since April, 1913.

OBITUARY

William Henry Nix, roadmaster of the Toronto (Ont.) Railway, died on Oct. 13. Mr. Nix was born in England, and settled in Toronto when he was thirty years of age. He became connected with the Toronto Railway as a driver of horse cars. His organizing power secured rapid advancement for him through various positions to the post of roadmaster.

Edward D. White, for more than a quarter of a century with the Brooklyn City Railroad, now included in the system of the Brooklyn (N. Y.) Rapid Transit Company, is dead. Mr. White was born in Brooklyn ninety-four years ago. He retired from the board of directors of the Brooklyn City Railroad early this year. During his long association with the road he was a director for twenty-seven years, a member of its executive committee for twenty-six years, and vice-president for nineteen years.

Andrew Radel died suddenly on Oct. 15 at his home in Bridgeport, Conn. Mr. Radel was born in Newark, N. J., fifty-three years ago. He moved to Bridgeport from Newark twenty years ago. Before that time he was interested in the development of a number of electric railways now included in the system of the Public Service Corporation of New Jersey. After going to Bridgeport, he assisted in building several electric railways there, which are now controlled by the Connecticut Railway & Lighting Company. At the time of his death, Mr. Radel was a director in the Newark & South Orange Traction Company and vice-president of the New Brunswick Traction Company. He was also president of the Seaview Railroad and Narragansett Pier Railroad, both of which are operated under lease by the Rhode Island Company, Providence, R. I.

RECENT INCORPORATIONS

***South Mountain Street Railway, Kleinfeltersville, Pa.**—Application will be made for a charter to construct an electric railway between Kleinfeltersville and Womelsdorf. Incorporators: Ralph L. Eberly, Clifford Strauss and Elmer A. Reist.

Pottsville & St. Clair Electric Railway, Pottsville, Pa.—Incorporated in Pennsylvania to construct a line from Pottsville to St. Clair. Capital stock, \$13,200. Incorporators: W. B. Rockwell, president; Van Dusen Rickert, Ira G. Walborn, C. F. Crane and Otto E. Farquhar, all of Pottsville. Mr. Rockwell, president of this company, is manager of the Eastern Pennsylvania Railway. [Aug. 14, '15.]

***Central Power Company, Chattanooga, Tenn.**—Application for a charter has been made by this company in Tennessee to construct an interurban line from Chattanooga to Cleveland. Capital stock, \$50,000. Incorporators: G. B. Adams, M. N. Whittaker, Sam Whittaker and Lon Foust.

FRANCHISES

Los Angeles, Cal.—The Pacific Electric Railway has received a permit from the harbor commission to operate the municipal terminal railway at the harbor. The company will also handle the cars of any other railroad which may connect with the city's tracks. The permit gives the city trackage rights over 2 miles of the Pacific Electric Railway Company's line, including the drawbridge between pier A, Wilmington, and municipal dock No. 1 in the outer harbor.

San José, Cal.—The San José Railroad has received a franchise from the Council for the construction of an extension on Alum Rock Avenue. The company bid \$150 for this franchise.

Lisbon, Me.—The Lewiston, Augusta & Waterville Street Railway has asked the Council for a franchise to relocate its tracks on 131 ft. of pile trestle and 35 ft. of steel girder bridge across the Sabattus River and 434 ft. of track on fill.

Lawrence, Mass.—The Bay State Street Railway has asked the Council for a franchise to build a double-track extension on the State Highway and on Water Street from the Lawrence-Methuen line to Ames Street.

Cincinnati, Ohio.—The West End Rapid Transit Company has asked the Council for a franchise to construct an electric railway from Anderson's Ferry to Third and Sycamore Streets. [Sept. 11, '15.]

Cleveland, Ohio.—The Cleveland Railway has received a franchise from the Council to construct a line through Parma township to Bean Road. The franchise extends to May 1, 1934.

Columbus, Ohio.—Supplementary franchises were granted to the East Linden Electric Railway by the Council of Columbus on Oct. 18 for two proposed routes, one from the Leonard Avenue viaduct to East Linden and the other through Shepard. The new ordinance authorizes lines on Hayes and Champion Avenues to Long Street and from East Linden west on Hudson Street to Neil Avenue.

Tacoma, Wash.—The Puget Sound Traction, Light & Power Company has asked the Council for a franchise to construct pole and power lines along the county roads in the districts of Puyallup, Burnett, Alderton, McMillin and Sumner. The franchise asks for three years in which to construct the lines.

Janesville, Wis.—The Janesville Traction Company has filed a surrender of its franchise with the Wisconsin Railroad Commission and has applied for an indeterminate permit, which will be granted by the commission.

TRACK AND ROADWAY

Alabama City, Gadsden & Attalla Railway, Gadsden, Ala.—Material has been ordered by this company for the reconstruction of its tracks on Gardner Street between

Ninth Street and Twelfth Street and work will be begun as soon as the material arrives. The tracks will be lowered according to the grade established by the city.

Fort Smith Light & Traction Company, Fort Smith, Ark.—The Fort Smith Light & Traction Company has been ordered by the Fort Smith-Van Buren Bridge Commission to remove all its property and equipment, including tracks and feed wires from the Fort Smith-Van Buren Bridge. Subsidiary companies of the company were also ordered to remove their property. This action is the result of the traction company and the bridge commission failing to agree upon a contract for the use of the bridge.

Pacific Electric Railway, Los Angeles, Cal.—A new line has been begun by the Pacific Electric Railway, which will serve El Segundo, Hawthorne, Lawndale, Farmington and Belvedere districts, as well as provide a new outlet from Los Angeles to Redondo Beach. The new line will leave the present Gardena line at Ionia Avenue and will directly connect at Hawthorne with the El Segundo line, already completed, as well as the Belvedere line to Redondo. Representing that the lines were being operated at a dead loss the company has made application to the city commission for the abandonment of service on the West Seventh Street and municipal dock local lines in Long Beach.

Municipal Railways of San Francisco, San Francisco, Cal.—The extension of the Geary Street Municipal Railway across Golden Gate Park from Tenth Avenue and Fulton Street to Fourteenth Avenue and Lincoln Way and thence to Judah Street is to be begun at once and it is expected that the line will be completed before Jan. 1. The supervisors have ordered the extension and are now making formal publication of this order preliminary to starting active construction.

Tampa (Fla.) Electric Company.—This company has completed the laying of double track from the Tampa Bay gates to the Boulevard, thus affording better service on the Union Station line.

***Moline, Ill.**—Moline capitalists are considering plans to construct a line from Moline to Coal Valley, with a possible extension to Galva and Cambridge.

Bloomington, Pontiac & Joliet Railway, Pontiac, Ill.—Work of changing the route of this road out of Pontiac to the north is progressing. The poles are set and the overhead work nearly completed. The necessary work for connecting the new track laid on Main Street with the old one on Wabash Avenue has been finished and it is expected that the track will be laid within a few days north to the crossing of the Illinois Central Railroad.

Union Railway, Gas & Electric Company, Rockford, Ill.—At a recent meeting of the Rockford Real Estate Board, held in Rockford, it was decided to appoint a committee to act with other civic organizations to urge the Council and the Union Railway, Gas & Electric Company to extend the franchise of the company and to secure needed extensions to various parts of the city.

Lafayette & Northwestern Traction Company, Lafayette, Ind.—Financial arrangements have been made for the construction of the first half of this company's line and the right-of-way is now being secured. The route has been changed from West Lafayette through Octagon and this change will shorten the route 3 miles. The M. A. Talbert Company has the contract for building the line from Lafayette to Kankakee, Ill. [Aug. 14, '15.]

Des Moines (Iowa) City Railway.—This company plans to extend its line over the Seventh Street bridge and rebuild about 20 miles of track in Des Moines.

Louisville (Ky.) Railway.—This company's Chestnut Street extension to Shawnee Park, via Twenty-seventh and Madison Streets, is nearly completed and it is stated that in all probability service will be begun on or before Dec. 1.

St. Paul (Minn.) City Railway.—Work will be begun at once by this company on the extension of its St. Clair Street line in St. Paul.

Gulfport & Mississippi Coast Traction Company, Gulfport, Miss.—Work has been begun by this company on the reconstruction of its line from Pass Christian to Gulfport and Biloxi.

Springfield (Mo.) Traction Company.—Material has been received by this company for the relaying of its track on Booneville Street, and work will be begun at once.

United Traction Company, Albany, N. Y.—This company plans to install new curves from State Street south into Broadway, to shift the tracks several feet east at the crossing at Broadway and Church Street and to connect the new double tracks at the south end of the Plaza with the present tracks in Broadway at Steamboat Square.

Interborough Rapid Transit Company, New York, N. Y.—The proposed form of contract for the construction of Section No. 2 of Routes Nos. 19 and 22, being a part of the Southern Boulevard and Westchester Avenue branch of the Lexington Avenue subway, has been submitted by the Public Service Commission for the First District of New York to the Interborough Rapid Transit Company, which will be the operator of the line, for its criticisms and suggestions. The company is made a party to the contract, and will bear part of the construction cost. The underground portion of this line ends at Bancroft Street, Bronx, and Section No. 2, which will be elevated, extends northerly from that point along Westchester Avenue to Eastern Boulevard, or Pelham Bay Park. This is the last section of the new city-owned lines to be let in the borough of the Bronx. The commission has now completed negotiations with the Federal Government for the construction of the necessary fixed bridge across the Bronx River. This was the last obstacle to the construction of the line. The company must return the contract within ten days, after which it will be put in final form and advertised for bids.

West End Rapid Transit Company, Cincinnati, Ohio.—City Solicitor Schoenle of Cincinnati has given the West End Rapid Transit Company an opinion to the effect that the consents of owners of abutting property along the route on which it proposes to build a line for the entrance of the Cincinnati, Lawrenceburg & Aurora Electric Street Railway to the business section of the city are not necessary. The charter provides for the construction of a commercial railroad, he said, and its purpose is somewhat different from those of an ordinary street railroad.

Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.—This company plans to construct an extension of its lines from New Castle to Beaver Falls.

Bartlesville (Okla.) Interurban Railway.—Construction has been begun at Dewey Avenue and Fifth Street, which is the final step toward completing the connecting link of the loop of the Bartlesville Interurban Railway with the main line. The line will be extended to Dewey Avenue and East Third Street.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—Both Columbus and Galena have called elections for voting bonds as bonuses for the Oklahoma & Interstate Railway. Columbus has been asked to vote \$20,000 and Galena \$15,000. Philadelphia financiers have agreed to purchase the bonds, and officers of the company say that actual construction will be begun by Dec. 1. It is practically certain that Columbus and Galena will vote the bonds, because it has been stipulated in the contracts that before the bonds are turned over to the company, the lines connecting Columbus with Galena, and Columbus with Commerce, must be completed and in operation. It is stipulated that this must be accomplished by May 1, 1916. [Oct. 16, '15.]

New Toronto, Ont.—The Council of New Toronto has passed a resolution that the Hydro-Electric Power Commission of Ontario be requested to investigate and report upon the cost of constructing and operating an electric railway from Toronto through New Toronto to London.

Sandwich, Windsor & Amherstburg Railway, Windsor, Ont.—Claiming that the by-law did not receive the assent of the ratepayers, and further, was canceled by a new Council, the City of Windsor on Oct. 14 asked the Appellate Division to set aside the order of the Ontario Railway Board, which gave the Sandwich, Windsor & Amherstburg Railway power to construct a loop line at Ferry Avenue, Windsor. The court dismissed the appeal, but varied the order of the board to read without prejudice so that the city might take free action to test the legality of the railway company's action.

Willamette Valley Southern Electric Railway, Portland, Ore.—Operation has been begun by this company between Mount Angel and Portland.

***Columbus, Pa.**—It is reported that grading has been begun for an electric railway from Columbus to Mayville. C. E. Bentley, Jamestown, N. Y., engineer.

Montreal (Que.) Tramways.—At a recent meeting of the Outremont Council, it was decided to notify this company that it will be required to extend its line in the spring from Mount Royal Avenue along St. Jean Baptiste, Rockland and Maplewood Avenues, Outremont.

***Beaumont, Tex.**—Plans are being considered by A. R. Crawford, Normangee, and associates to construct a line from Beaumont to Waco, via Normangee, Madisonville, Huntsville and Cold Springs.

Virginia Railway & Power Company, Richmond, Va.—When this company tears up its tracks along the Boulevard north of Broad Street so that thoroughfare may be repaved, the track will not be relaid, but will be placed on Altamont Avenue. The company will not be permitted, if it extends its line, to run across the newly-built bridge on the Boulevard over the Richmond, Fredericksburg-Potomac Railroad Company's tracks, but in all probability the city will request the company to build a bridge over Altamont Avenue at a cost of \$6,000 which will be refunded by the city when the structure is completed.

Everett Railway, Light & Water Company, Everett, Wash.—The Riverside Commercial Club has petitioned this company for an extension of its lines on Riverside Avenue. The plan is to have a line extended north on Chestnut Street to Sixteenth Street, east to Summit Street and south on Summit Street, making a complete loop.

Chicago & Wisconsin Valley Railroad, Madison, Wis.—Application has been made to the Secretary of State for an amendment to this company's charter, changing the name to the Wisconsin Interurban System. The new system has acquired all title and interest to property owned by the company absorbed. The company proposes to build lines from Madison to Janesville, Madison to Portage, from Middleton connecting with the Portage line and from Madison to Fond du Lac. The road will be financed by Herbert Green & Company, Chicago. J. E. Jones, who was the original promoter of the line, will be actively connected with the new organization. [Oct. 16, '15.]

SHOPS AND BUILDINGS

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me.—Construction has been begun by this company on its freight shed on Water Street, Augusta. The building will be 25 ft. x 60 ft.

Pekin (Ill.) Municipal Railway.—The carhouse of the Pekin Municipal Railway at Rosedale, under construction for the past several weeks, was damaged by fire on Oct. 10 to the amount of more than \$1,000.

Southern Traction Company, Dallas, Tex.—This company has completed the construction of its passenger station at Milford.

POWER HOUSES AND SUBSTATIONS

Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.—This company is doubling the capacity of its Lowellville plant from 20,000 hp. to 40,000 hp. A 20,000 hp. turbo-generator has been ordered from the General Electric Company and also eight Babcock & Wilcox boilers, equipped with Taylor automatic stokers, similar to the ones now in use. The contract for the engineering and installation of the plant has been let to the Stone & Webster Engineering Corporation. To accommodate the new equipment the power house itself will be greatly enlarged.

Ashland Light, Power & Street Railway, Ashland, Wis.—Dismantling of the original power plant of the Kentucky Electric Company, at Louisville, has been completed and the machinery and much of the structural materials have been shipped to Wisconsin. The Ashland Light, Power & Street Railway bought everything except the reinforced concrete smokestack which the Louisville Gas & Electric Company is now wrecking.

Manufactures and Supplies

ROLLING STOCK

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me., has ordered five flat cars from the Laconia Car Company.

Pekin (Ill.) Municipal Railway in a fire which recently destroyed its car barns lost a storage-battery car which had formerly been operated on its lines.

Boston (Mass.) Elevated Railway has ordered from the Laconia Car Company forty-eight additional center-sections for the construction of Lindall articulated cars out of its present car equipment.

United Traction Company, Albany, N. Y., has issued specifications for fifteen new cars, the purchase of which was recommended by the Public Service Commission, as noted in detail in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, 1915.

Trenton & Mercer County Traction Corporation, Trenton, N. J., was reported in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16, as preparing specifications for ten new city cars. This company advises that its specifications are of a preliminary nature only.

Durham (N. C.) Traction Company is contemplating the purchase of a few new cars, through its operating company, the Doherty Operating Company, New York. The number of cars is undecided and specifications will not be ready to send out for about two or three weeks.

Des Moines (Iowa) City Railway was reported in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16 as expecting to purchase twenty-five new steel cars. This purchase is contingent on the passage of a proposed ordinance for renewing its franchise, which has been approved by the City Council and which will be submitted to a referendum-vote on Nov. 20.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y., noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 16 as having issued specifications for ten new city cars, has placed the order for these car-bodies with the Southern Car Company. The cars will be of the end-entrance type, with closed vestibules, folding and sliding doors and folding steps. Sixteen cross-seats and two longitudinal seats at each end of the body will furnish a seating capacity of forty-eight. Trucks will be of the maximum-traction type.

TRADE NOTES

National Car Wheel Company, Rochester, N. Y., has re-elected Edward H. Chapin as vice-president of the company and as a member of its board of directors.

Electric Service Supplies Company, Philadelphia, Pa., has appointed the Grayson Railway Supplies Company, St. Louis, Mo., as its Southwestern sales representative in the States of Missouri, Arkansas, Texas and Oklahoma.

Railway Specialties Corporation, New York, N. Y., has appointed J. N. Ebling as general manager to succeed Fred W. Roth, resigned. Mr. Ebling has been for five months sales manager of this company and continues to serve in this capacity in addition to that of general manager. He was previously connected for about four and a half years with the United States Light & Heating Company, Niagara Falls, N. Y.

Stanley H. Smith has been appointed district sales manager of the Pennsylvania Steel Company in charge of the Chicago territory, succeeding R. E. Belknap, who has been appointed district sales manager of the same company, for the New York territory. Mr. Smith has been a salesman in the Pennsylvania Steel Company's Chicago office for the past year, having come from the Cleveland office of the same company where he served in a similar position.

T. L. Smith Company, Milwaukee, Wis., has purchased the exclusive manufacturing and selling rights of the Albrecht excavator and loader and is in position to make prompt shipments of these machines. This excavator and loader can be used for excavating, for big foundations, basements and drainage ditches, for back filling, for loading sand, gravel and other similar materials, and as an economical investment for the contractor who handles street and highway paving. It can be used to advantage on the ordinary roadway in place of the regular horse scraper.

Van Dorn & Dutton Company and the **Van Dorn Electric Tool Company, Cleveland, Ohio,** have acquired a new site on Woodhill Road between Kinsman and Buckeye Roads, on which they will shortly begin the erection of new plants, which will afford opportunities to more than double the capacity of their present factories in the production of gears for the former company and of electrically operated drilling and reaming machines, grinders, etc., by the latter company. The new plant of the Van Dorn & Dutton Company will be 400 ft. x 50 ft. x 80 ft., two stories high on the street level. The building site is on sloping ground, the contour of which permits the erection of a third story the greater part of the length of the building and a fourth story at the rear end. The plant of the Van Dorn Electric Tool Company will be a two-story building, 50 x 275 ft. The two buildings will be joined in the front by one two-story office building, as the management personnel of both companies is largely common. In addition to the main buildings a thoroughly equipped hardening and treating plant will be erected. Ample railroad facilities are provided by a switch from the Cleveland Belt Line Railroad. It is expected to occupy the new buildings by April 1, 1916.

ADVERTISING LITERATURE

S. K. F. Ball Bearing Company, New York, N. Y., has issued a catalog describing the applications of its ball bearings for car lighting generators.

Holophane Works of General Electric Company, Cleveland, Ohio, has issued a catalog describing the principles and designs of its holophane refractors for street lighting.

Westinghouse, Church, Kerr & Company, New York, N. Y., have issued a folder describing the new Communipaw engine terminal of the Central Railroad of New Jersey, which this engineering company designed and built.

Ohmer Fare Register Company, Dayton, Ohio, has issued a folder describing its transfer machine for printing and issuing transfers on street cars. This machine was described in detail in an illustrated article which appeared in the *ELECTRIC RAILWAY JOURNAL* of Sept. 11, 1915.

Barrett Manufacturing Company, New York, N. Y., has issued a large folder containing a bird's-eye view of the modern plant of the National Lamp Works of the General Electric Company at Nela Park, Cleveland, Ohio, all the buildings of which are covered with Barrett specification roofs. The foundations and all the connecting tunnels are water-proofed with specification pitch and felt and practically all of the buildings have Tar-Rok sub-floors.

Hamilton Watch Company, Lancaster, Pa., has issued advertising literature on its watches for railroad men. The fact that 56 per cent of the watches in service on railroads where there is an official watch inspection are Hamilton watches, is quoted as an indication of its unusual time-keeping qualities. One of the booklets contains numerous testimonials from conductors, locomotive engineers and train dispatchers as to the liability of the watch. For railroad use the company recommends its larger watches because they are built heavy and their larger dials with bold figures and large black hands enable one to determine the time more quickly at greater distances, especially in a dim light. One of the booklets issued contains convenient blank forms for tabulating watch inspection records.

Searchlight Company, Chicago, Ill., has issued a bulletin which contains a discussion of the oxy-acetylene process of cutting and welding. The booklet explains the properties of acetylene and shows by the history and method of its production the advantages of this particular process, i. e., the securing of an absolutely pure and dry gas by means of a thorough washing process. The elimination of such impurities as phosphorus, sulphur and ammonia is important, as these have a chemical reaction on most metals, and consequently will affect the welding of such metals. When the acetylene is thoroughly dried it is put in cylinders by being absorbed by acetone, which at a pressure of ten atmospheres will absorb 250 times its own volume of acetone. Through the use of a packing made of infusorial earth and pitch the acetylene gas is released in a dry condition without any acetone being released. This dry acetylene is capable of producing a temperature of 6300 deg., a heat unattainable by a gas which is not dry.

ANALYZE RAIL RENEWAL PROBLEMS

Some engineers have looked askance at the formula suggested in our issue of July 31 to test the economy of renewals in the "Girder and High T-Rail Renewal" article. Others have expressed the opinion that financial considerations based on pure economy seldom govern rail renewals but that municipal demands or public policies compel renewals regardless of the economy of the problem. By the same token, it is the public desire that all railway companies should reduce fares, but this is no reason why the companies should do so. To make a renewal before economy dictates and without a place to relay the old rail so as to obtain its complete wear life is equivalent to a fare reduction. Way engineers cannot afford to be responsible for an increase in the expense of operation which amounts to a reduction in fares. We do not mean to say that rail renewals in the past have been generally made on an extravagant basis, but we seriously doubt whether all track engineers in the past have so carefully analyzed their maintenance problems that they know, to a reasonably close degree, the economy of each case as it presents itself. True, some of the factors entering the problem must be assumed, but an assumption carefully made on the basis of experience is much better than a mere guess. If the municipal authorities demand a renewal before it is really needed, the actual loss to the company in dollars and cents is the kind of an argument the public can understand. The mere expression of opinion of an engineer, particularly when he is a company man, is of little avail. In other words, we believe that rail renewals, like other operating problems, are capable of scientific analysis.

MAN VERSUS THE MACHINE

A recently-published report on the disastrous troop-train wreck that occurred in England some four months ago discloses evidence of the most amazing character as to the contingency of that decidedly mysterious mental process frequently classed as "man failure." The accident, which was the worst in the history of English railroading, appears to have been brought about by a signalman's failure to comprehend the presence of a passenger train standing in the block beyond his signal tower hardly 100 ft. away. Although the signalman had actually alighted from this train but a few minutes before, and could hardly have helped seeing it from the tower window, he cleared the block for a following train, quite as if he wanted the wreck to occur. In this case there were none of the contributory causes such as incompetence, fatigue, intoxication, or distraction from the duty at hand, that could

possibly be brought forward. "Man failure" was the only explanation, and as an astounding climax to a lengthy record of experiences pointing to the inevitability of mental lapses in long-continued work of a repetitive nature, it emphasized the importance of automatic means where such conditions are involved. The manual block system of signaling, which was in use at the point where the wreck occurred, has unquestionably many material advantages, but in the face of such a failure of the human controlling agency, which here might well have been dominated by Edgar Allen Poe's "imp of the perverse," the value of the automatic signal becomes obvious. The action of a machine in case of failure can, at least, be predicated in advance and made subject to mechanical checks.

A VICIOUS "EXPERIENCE ORDINANCE"

The "experience ordinance" recently passed by the city of Cincinnati was undoubtedly intended as a form of support to traction employees who might be considering future strikes. Everyone will admit that inexperienced platform men ought to have ample instruction before being placed in complete control of a car. No street railway could afford regularly to take the risk of accident damages incident to the operation of cars by untaught recruits. For that reason the ordinance is about as valuable to the city as an armless dog-catcher. Yet the character of the legal restrictions governing the procedure in this case actually renders it impossible for the company to act in emergencies, regardless of its ability to obtain experienced car operators, because the ordinance requires that new men must be instructed only by old employees who shall have been in service for "one year immediately preceding the date of giving such instruction." Obviously, if all the old employees suddenly leave the service, the instruction of new men to take their places can hardly be undertaken without recourse to miracle-working. The facts are that if the ordinance was enforced in such a case, the community would suffer more under it than the railway company. The company would then have a choice of two things. One would be to assume that the law automatically relieved the railway from its obligation to run cars. This would give the walking public plenty of time to ponder over the wisdom exhibited by their chosen authorities. The other plan would be to disregard the law. If it should do this the company would undoubtedly be sustained by public opinion, because we cannot believe that the many sensible people in Cincinnati really think that the present trainmen in that city possess a monopoly of all knowledge in regard to proper car operation.

ENGLISH MUNICIPAL FARES RAISED

American electric railway operators will find it difficult to sympathize with the mingled astonishment and disapproval that was aroused at the recent Municipal Tramways Association Conference in London, when Alfred Baker, general manager of the Birmingham municipal lines, described the adoption of an increased scale of fares. Rather will they heartily indorse the action taken in Birmingham. According to Mr. Baker, the municipal tramways of England at the beginning of operation dealt "generously" with the public in the matter of cheap fares, long distances and liberal wages. In time, however, it was discovered that the general costs were steadily mounting, and the situation became worse after the outbreak of the war. In Birmingham, for example, the wages of the traffic and permanent way staff have increased 10 per cent since 1913, taxes have more than doubled in the last three years, and the cost of stores and materials (exclusive of permanent way materials) has shown an average increase of 27 per cent on account of the war. With expenses thus coming perilously close to receipts, the municipal tramway committee raised the fares and increased the receipts £1,666 a week without a public murmur.

Mr. Baker refused to say, however, that raising fares is a general remedy for all municipal tramways to use in meeting the higher costs of operation, and from the outspoken criticism by some managers the plan in truth does not seem likely to be widely adopted. Yet in fearlessly pointing out the weakness of English municipal tramways to-day as a result of their excessive and unbusiness-like liberality of operation, Mr. Baker has brought into prominence a question that sooner or later must be decided in connection with every municipal undertaking, whether in England or elsewhere. It cannot be argued that the present higher costs are only the transitory result of hostilities, for many municipal committees were forced to look anxiously at the financial condition of their undertakings even before the war broke out, and many of the increased burdens of the last year or so will, we believe, show a tendency toward permanency.

The question that is thus presented for municipal advocates to solve is one which involves the fundamental concept of municipal operation as viewed by two distinct schools. One faction believes that a municipal tramway should be run as a business enterprise to return a profit, while the other maintains that such objects as cheap fares, more frequent service and extensive city developments through tramway operation constitute the goal to be reached, whether the tramway shows a loss or profit. The first view is the one usually advanced when the road is municipalized. The advocates of municipal ownership want simply that the city should have the "profit" which the company formerly earned. But as politics creep into its operation and as demands are made for the extension of the lines in this direction or the other and for higher wages, these concessions and economical operation are found incompatible. Then follows the demand that the deficit should be made good by the general taxpayer.

In their ardor for making concessions to the riding public many English municipal lines have lost sight of the fundamental economic relation between the price and the cost of transportation, but now with the increased cost of operation their concessions to the patrons have turned to plague the inventors in a way that commands attention. We hope that the volume of higher costs will bring enlightenment as to the value of cost-accounting principles in fare-making.

NEW ROCHELLE MOTOR-BUS LINE

The franchise which was granted for a motor-bus line in New Rochelle last week by the Public Service Commission of New York, Second District, places the bus line on an entirely different basis than that of the ordinary jitney. Indeed, with the provisions that children under five and policemen and firemen on duty shall be carried free, that buses shall run on at least a twenty-minute schedule from 6.30 a. m. to 1.30 a. m., that 3 per cent of the gross earnings shall be paid quarterly to the city, that a bond shall be given to insure prompt payment of this and other obligations and that the franchise shall be forfeited in the event of the insolvency of the holder or failure to operate the system in accordance with the terms of the franchise, it reminds one of a railway franchise. In granting the franchise the commission also has emphasized its present policy of protecting already established utilities under its jurisdiction from unnecessary competition and has rejected two of the six routes for which application had been made by the motor-bus company. The reason given was that these routes were too closely competitive with the existing trolley system. The maximum headway is to be twenty minutes and the fare is to be 5 cents. The length of each route is from 1 mile to 1½ miles.

If the motor bus company should accept this franchise and should begin operation the installation will form an interesting example of the relative merits of bus and electric street car operation under somewhat similar conditions. Although the average passenger ride in this case will probably be less than a mile we are rather skeptical of the success of the project. The promoter will have to average three passengers per mile or four and a half passengers for each half trip of 1½ miles to pay operating expenses, reckoning these at 15 cents per bus-mile, and will have to carry considerably more than this number to provide for depreciation, taxes, a profit and interest on the investment. The possibility of doing this in local service in a town like that of New Rochelle, with its population of some 32,000 people, is not great. We are by no means disposed to decry the use of motor buses or to deny that there is a field for them in passenger transportation. We think there is a good field and one which is much wider than that to which they have been at present applied. But we do believe that where the franchise calls for a regular schedule and other similar traffic regulations, as in this case, the number of places where motor buses can be made to operate successfully on a 5-cent fare is very limited.

PAVEMENT SAND CUSHION BECOMING OBSOLETE

Comparatively recent experimental pavements in which brick or granite block was laid on a mortar cushion, instead of the usual sand cushion, demonstrate the utility of the former which, it is believed, will eventually relegate the sand cushion among the other obsolete practices of pavement engineers. Several years ago granite-block pavement was laid on a mortar cushion by the Houston (Tex.) Electric Company with most satisfactory results. As early as 1904 the Philadelphia Rapid Transit Company paved between its rails with granite block on a dry mixture of sand and cement and the pavement is still in service.

More recent experiments made on highways and in paved streets have also proved the advantages of the mortar cushion. This type of cushion is just as applicable to the track allowance as it is for highway or street-paving purposes and will undoubtedly eliminate many of the common defects which can only be attributed to the unstable sand cushion. To obtain the maximum life of any pavement, it must be impervious to water. When a rigid surface is laid on a resilient cushion it is practically impossible to make the surface waterproof. Water percolating through the joints or along the rail in any type of unit pavement carries silt which ultimately starts a pumping action in the pavement surface. During wet seasons or on pavements that are sprinkled frequently this silt, along with the sand, is forced to the surface and a pocket or rut is formed in a comparatively short time. Deterioration of this kind, however, is not as serious as that resulting from freezing and thawing of the sand cushion. Many instances could be cited where the brick surface has been heaved so badly by freezing and thawing that complete relaying was necessary.

Better pavement surfaces at a lower cost per square yard may be obtained with the dry sand and cement mixture than with the old-style sand cushion. A mortar cushion, together with a grouted filler, insures a pavement absolutely impervious to water, and eliminates the shifting and yielding incident to a sand cushion which is largely responsible for uneven pavement surfaces. Sand cushions were supposed to have furnished a resilient base for the rigid pavement surface. If such a base resulted the sand cushion could not perform its function properly because any movement would unquestionably decrease the life of the pavement surface. The mortar cushion lends itself just as readily to construction as the sand cushion and produces a pavement surface which will not fail because of wide changes in temperature. Openings in the pavement to make repairs will cost slightly more, perhaps, but this is to be expected if pavement life is to be prolonged. Any structure designed to facilitate repairs is quite certain to fail before one designed with wear life as the governing factor. A longer wear life will make fewer repairs necessary, and in the end the increased cost of making openings in the pavement will be more than offset by reduced pavement maintenance.

LARGE AND SMALL POWER PLANTS

Although one cannot deny that there is a great fascination in such large generating units as have been described in recent issues of the *ELECTRIC RAILWAY JOURNAL*, it is profitable occasionally to note some of the interesting developments that are going on in small plants. An example of such a plant is that of the Springfield (Ohio) Railway, described in this week's issue. In this plant the condensing, coal and ash-handling and oiling equipments are as ingenious and as worthy of study as the respective elements in many plants of ten or more times its size. This is also an excellent example of a rehabilitation in which a considerable part of the old plant was incorporated effectively in the new, and that without serious interference with operation.

That the small railway power plant is an important element in transportation is indicated by the fact that two-thirds of the energy used by electric railways, or roughly 6,000,000,000 out of a total of 9,000,000,000 kw.-hr., is still generated in the railway companies' plants, or was at the time of the last census report. There is undoubtedly a well-defined tendency on the part of electric railways located in the territory of large central stations to buy energy, but, in spite of this fact, it is significant to note that between 1907 and 1912 there was an increase in generating capacity of electric railway power plants of 45.4 per cent. The figures for 1912 show that in that year a total of 495 companies had a combined generating capacity of 3,665,000 hp., or an average of about 7400 hp. each. Allowing for a few extremely large plants this means that there is a very considerable number of plants averaging about the size of that in Springfield.

In these plants it would appear that there is need of more economical operation to offset increasing unit costs. While in the states containing very large cities the cost of energy per kilowatt-hour has decreased or remained stationary, in other states it increased about 14 per cent in five years. In the United States as a whole it decreased more than 15 per cent in the same period, due to the large plants. It thus behooves the managers of the small plants to study their problems most carefully and look to savings in labor and material, both in operation and in maintenance. Even if a plant is not near enough to a large central station to force competition in cost of electrical energy production, it is desirable to generate this energy as cheaply as possible to offset in part the increase in costs of other components of transportation. The power plant must have reasonable appropriations for the purchase of equipment which will conduce to this end, as the use of labor-saving devices is an important element of economy.

While the *ELECTRIC RAILWAY JOURNAL* will continue to chronicle the interesting achievements in the power plants of 100,000-kw. capacity or more, the editors realize that to the average railway man such plants are of general rather than immediate interest. The small and moderately-sized plant will therefore, as heretofore, continue to have a large share of attention in the columns of this paper.

A Railway Power Plant Rebuilt Without Interfering with Operation

A Plant of Moderate Size Has Been Newly Housed and Equipped with Efficient Auxiliaries, Including a Novel Form of Condenser and an Original Oiling System—Reciprocating Engines Are Retained for the Present

The Springfield (Ohio) Railway, a subsidiary of the American Railways, Philadelphia, Pa., has just completed the remodeling of its power plant located at the corner of Power and Warder Streets in Springfield. The new plant has been built around and within the old one without interference with operation. The company has now a most satisfactory plant, and one up to date in every particular with the possible exception of the use of reciprocating engines instead of the more popular steam turbines. The impelling reason for the use of reciprocating engines in the new plant was that the American Railways had on hand, in addition to the two McIntosh & Seymour units originally installed here, two excellent engines which had been displaced with steam turbines in other stations. While the reciprocating engines were installed in this plant for the present the possibility of changing later to turbines was considered and provision was made for doing so.

In rebuilding the plant without interfering with operation many puzzling problems in piping support, etc.,

ing crane. A basement for the accommodation of auxiliaries extends beneath the entire building. No wood was used in the construction of the building, the doors, door frames and window frames being of steel and the floors and roofs of concrete.

THE BOILER ROOM

In the boiler room the firing aisle is located against the partition. Over this aisle is a suspended steel bunker of 300 tons capacity carrying below it a weighing larry from which the coal is spouted to the stokers. The larry is motor-driven and floor-controlled, and it has a capacity of 1 ton. Cast-iron gates are provided in the bunker bottom with a 5-ft. spacing, thus minimizing the amount of dead coal therein. The larry is equipped with a ticket recorder so that accurate records can be kept of the coal consumption as a whole, for the several boilers and for the several firemen.

The boiler equipment comprises a total capacity of 2100 b.hp. of Stirling-type, water-tube boilers. There

SPRINGFIELD RAILWAY POWER PLANT—THE OLD POWER HOUSE AND THE NEW ONE

had to be solved. How some of them were solved is indicated in several of the illustrations which accompany this article. Of particular interest were the schemes used for taking care of the flue gases while installing the fan and economizer, for supporting the steam header while the wall behind it was removed, and for protecting the operating machinery amid the dirt and confusion.

THE BUILDING

The pair of illustrations above show the appearance of the two stations, and subsequent pictures indicate the way in which one was gradually superimposed on the other. The new building was designed for this superposition so as not to interrupt regular service. The general layout of the plant is indicated in one of the line cuts. The new building is one story in height, with walls of brick and foundation of concrete below ground and ashlar cut masonry above ground. It is divided by a firewall into engine and boiler rooms of equal size, and in the former is installed a 20-ton Whit-

are six units, four of 400-hp. capacity each, and one each of 300-hp. and 200-hp. capacity. Two of the large boilers are new. All boilers are equipped with Murphy stokers with both electric and steam drive. Beneath the stokers is a track for ash cars, forming part of a very complete equipment for handling ashes.

Draft for the furnaces is provided by means of a brick chimney 8 ft. in diameter at the top and 150 ft. high, and a steam-driven induced-draft fan. As shown in the general plan, there are three outlets from the main smoke flue, one through an economizer chamber and the fan, one direct through the fan, the other through a by-pass. The economizer is of the Green type and is rated at 2000 hp. Stack, fan-house and economizer are all located out of doors, permitting a simple and economical arrangement of the equipment which was placed inside.

The boiler-room auxiliaries include an open-type Cochrane feed-water heater of 2000-hp. rating, Warren vertical marine-type feed pumps of 350 gal. per minute capacity each, and a water softener to purify make-up

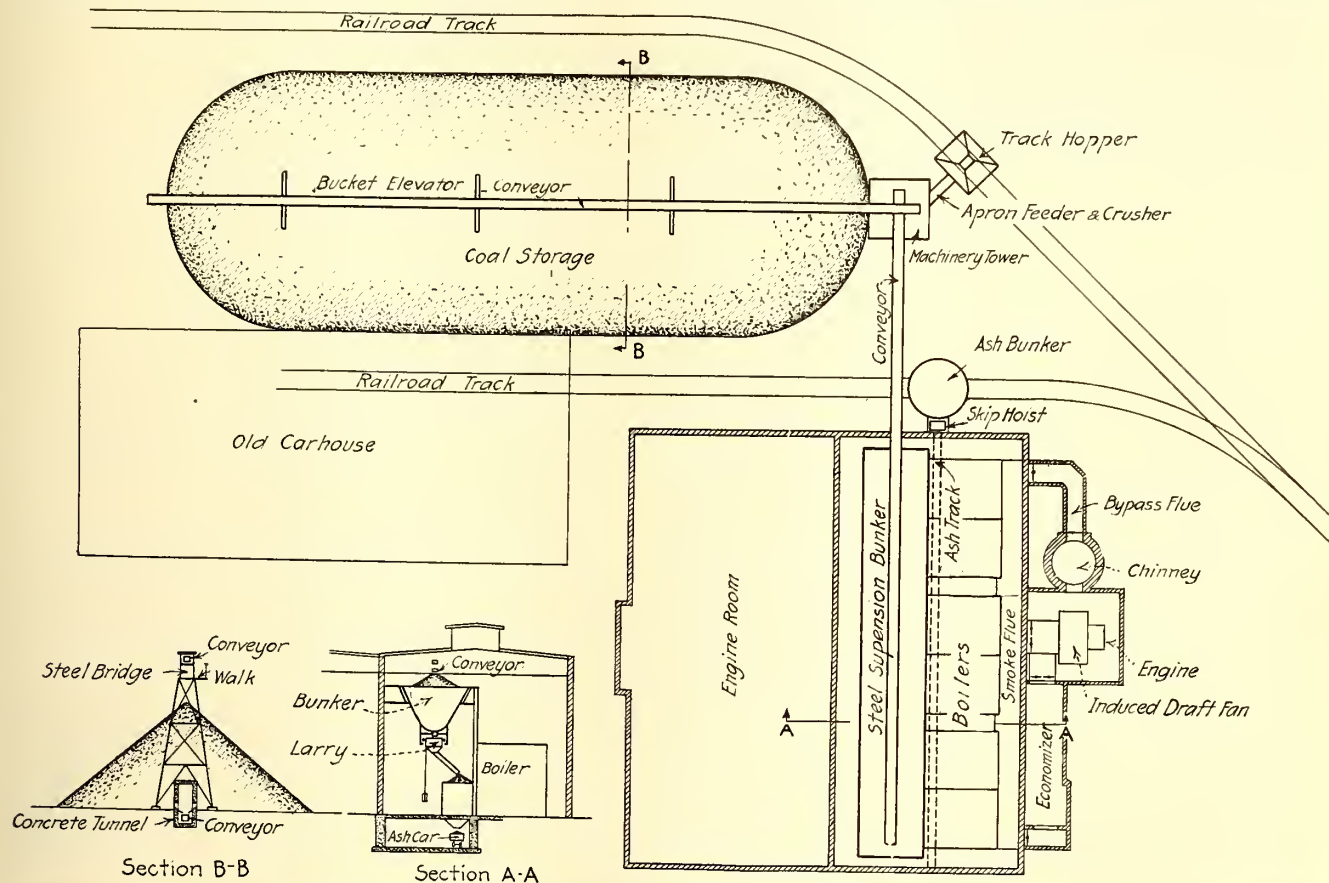

water. The last-named is necessary because the raw water from the wells is very hard, containing 24 grains of incrusting solids per gallon and this caused much trouble in the old plant.

THE ENGINE ROOM

In the engine room four units of a total capacity of 1975 kw. are installed as follows: One 450-kw. McIntosh & Seymour tandem-compound condensing engine with GE generators; one similar 500-kw. unit; a similar 500-

kw. engine coupled to a Crocker-Wheeler generator, and a 525-kw. Allis-Chalmers Corliss engine coupled to a GE generator.

The engines exhaust into one exhaust main which at one end connects with two Kuylenstjerna barometric surface condensers, which are described later in this article. Before it reaches the condensers the steam passes through a Sweets oil separator where the oil is removed to the extent of 99 per cent. This main exhaust line is also provided with automatic free exhaust

INCLOSING OLD ONE

valves in each end so that, if necessary, some of the units can be run non-condensing when the others are in on the condenser.

In the engine-room basement are two condenser circulating pumps drawing water from ten 35-ft. driven wells located on the property near the power house. There is also a connection to a near-by creek. Two steam-driven, reciprocating vacuum pumps for the condenser are located on the engine-room floor.

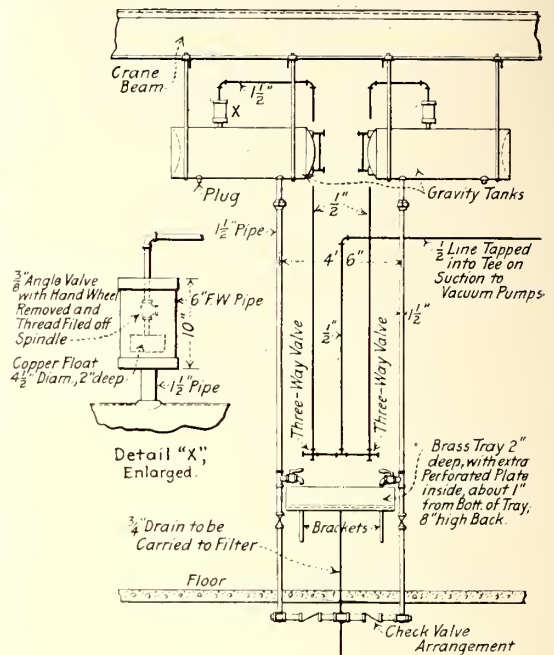

The generator output is controlled through a switch-board of standard GE make, containing four generator, one lighting, one totalizing and six feeder panels, with ample room for expansion. The outgoing feeders inside the station are supported on a steel cable rack mounted on the building wall, and outside they are carried upon angle-iron poles 40 ft. high above ground.

OILING SYSTEM

The oiling system differs from the usual type in the use of the vacuum from the condenser, or the condenser vacuum pump, to lift the oil from the filter to the elevated storage tanks. The details of the scheme can be seen in the accompanying diagrams. Three parts of the system are referred to therein, as follows: The elevated

storage tanks, two in number, of a capacity of 50 gal. each, together with the accompanying valves, the oil filter and auxiliary storage tank (not shown but indicated by lettering near the pipes leading to them), and a check-valve arrangement in the pipe connecting the elevated and low-level tanks and in the oil feed pipe.

The suction pipes enter the elevated tanks at the top through a home-made check valve consisting of an angle

SPRINGFIELD RAILWAY POWER PLANT—STORAGE TANKS
AND PIPING OF OILING SYSTEM

valve operated by a copper float which rises when the tank is filled with oil. In the suction pipe line to each tank is a three-way valve operated by hand during the filling operation. In one position (filling) this valve puts suction on the tank, in the other atmospheric pressure is applied, allowing for gravity feed to the bearing pipe line.

As stated, there is a check-valve system in the feed

SPRINGFIELD RAILWAY POWER PLANT—TEMPORARY CONSTRUCTION DURING REBUILDING

line. This is shown diagrammatically herewith. It consists of four swing check valves, 1, 2, 3 and 4, which allow oil to flow in the directions shown by the arrows. When tank A is under suction, B is under atmospheric pressure. Then oil flows through valve 1 into tank A, and out of tank B through valve 3 to the oil cups, and vice versa.

With this arrangement it generally takes about five minutes to put a barrel of oil from the basement to the elevated tanks. If the condensers do not happen to be in operation when the tanks are to be filled the air pump can be started up for a few minutes. The suction pipe is tapped into the vacuum line near the air pump for

SPRINGFIELD RAILWAY POWER PLANT—CHECK VALVES IN OIL-FEED SYSTEM

this purpose. The operation of the system is very satisfactory to the attendants and there is no sticking of the valves as they all work in oil. The system was designed by Adolph Kuylenstjerna, mechanical engineer of the company.

APPARATUS FOR HANDLING COAL AND ASHES

Coal is brought into the yard in the railroad cars, from which it is dumped into a steel track hopper. Through this it falls upon an apron feeder which delivers it to a two-roll crusher. The crushed coal is distributed upon the storage pile by a V-bucket conveyor onto the vertical run of which the crusher discharges. For direct filling of the boiler-room bunker a cross-conveyor is provided, connecting with the upper run of the

SPRINGFIELD RAILWAY POWER PLANT—CONVEYER HOUSE, CONDENSERS AND ASH BIN

storage-pile conveyor. The horizontal run of the latter is carried on a trestle, the return run being through a concrete tunnel. Coal to be reclaimed from storage is admitted to the conveyor through gates.

At the junction of the yard conveyor and the boiler-room conveyor is a tower which contains all of the driving machinery, suitably surrounded with guards.

The storage space has a capacity of 3000 tons of crushed coal. The experience of the American Railways with storage of crushed coal indicated that there was not an undue fire risk incurred thereby, while this practice permitted the use of simple machinery, cheap to install and easy to operate.

The ashes are handled entirely separate from the coal so that the two equipments can be operated according to their own requirements. Ashes are collected in pits under the stokers, whence they are drawn into a push car. This car has roller bearings, and its capacity is such that when fully loaded it can be easily pushed by one man. The car dumps into a skip hoist located at one end of the building, the skip bucket having a capacity 10 per cent greater than the car and a width 1 ft. greater to prevent spilling during filling.

SPRINGFIELD RAILWAY POWER PLANT—COAL CONVEYING AND STORING EQUIPMENT

The operator starts the hoist, which is electrically driven, by means of a controller, after which its operations of dumping, returning to the starting position and stopping are automatic. The ashes are stored in the elevated bunker shown in the plan view and in one of the halftones.

THE CONDENSERS

The condensers are mounted upon a steel tower outside the building with a hot well below. The hot well is in two compartments, one for the circulating water and one for the condensate. The compartment which holds the condensate is equipped with an oil-filter bed intended to remove any trace of oil still remaining in the water coming from the condensers.

The condenser itself, also the invention of Mr. Kuylenstjerna, is of the surface type but combining with this an auxiliary jet-condenser feature. By referring to the cross-section shown herewith it will be noted that the circulating water enters at the top and passes downward through the central group of tubes and up-

ward through the outside ring of tubes into the trough *C*. Flowing over the lip of the trough it forms a thin tube, finally leaving by the outlet *E*, through the tail pipe, to the hot well below.

features of this condenser the following: As the upper tube plate is free to rise and fall with the expansion and contraction of the tubes it was possible to expand the tubes into the sheet. As the tubes are open at one end, tube leaks do not affect the vacuum and at the same time the vacuum assists in lifting the water from the pump into the condenser. The hot steam meets the hottest water, thus minimizing tube strains. The vertical position of the tubes enables each to carry off its own condensate. The absence of baffles in the tubes allows free circulation. The jet-condenser feature provides for peak loads, permitting the capacity to be figured for average load. There is no need for a wet-vacuum pump as the barometric feature takes care of the condensate. The arrangement provides for easy cleaning and draining. The surface-condenser feature provides for freedom from scale and yet many of the jet-condenser features are retained. The tube surface in the condenser is about 2000 sq. ft., which at the nominal rating indicates a capacity of 2000 hp. The condenser of the size shown has handled as high as 3000 hp.

As stated, the hot well has two compartments, one for the circulating water and one for the condensate. They are side by side and both deep enough to thoroughly seal the condenser tail pipes immersed in them. Between the two chambers is an outside pipe connection with a swing check valve permitting make-up water to flow into the condensate chamber when the level falls sufficiently.

ADMINISTRATION AND MANAGEMENT

The power plant remodeling described above is part of a rehabilitation scheme of which another section, comprising new shops and carhouse, was described in the issue of the *ELECTRIC RAILWAY JOURNAL* for March 20, 1915, page 556. The power plant work has been carried out under the direction of the American Railways Company, of which H. J. Crowley is general manager, and A. Kuylenstjerna is mechanical engineer. Adolph Schmittauer was superintendent of construction in direct charge of the work. The Springfield property is under the management of George C. Towle, general manager of the People's Railway, Dayton, Ohio.

Anniversary of Incandescent Lamp Invention

Edison Day, Oct. 21, commemorated the thirty-sixth anniversary of the invention of the electric incandescent lamp by Thomas A. Edison. On Oct. 21, 1879, Mr. Edison first successfully made a carbon filament glow when a current of electricity was run through the filament in a glass bulb from which the air had been exhausted. This was even before he had successfully determined and chosen carbonized bamboo, the only substance used for about ten years in making filaments for commercial lamps, which was followed by the "squirted" filament employing carbonized cellulose in one form or another, next the metallized carbon filament, then the pressed tungsten filament, and finally the special form of drawn tungsten wire which is used in the modern Mazda lamps.

The Interborough Rapid Transit Company, New York, N. Y., has already converted six of the 478 composite cars, used in the subway, into all-steel cars. The composite car bodies were removed from the trucks and new all-steel bodies placed upon those trucks. The company has notified the New York Public Service Commission for the First District that already 184 steel car bodies have been received and that the work of converting the composite cars is progressing at the rate of thirty-one cars per week.

SPRINGFIELD RAILWAY POWER PLANT—CROSS-SECTION OF BAROMETRIC CONDENSER

ward through the outside ring of tubes into the trough *C*. Flowing over the lip of the trough it forms a thin tube, finally leaving by the outlet *E*, through the tail pipe, to the hot well below.

The exhaust steam enters at *G* and impinges upon the tubes, being forced between the tubes by a baffle ring, *I*. Any steam remaining uncondensed flows through the opening *M* into the outer space in the shell, there coming into contact with the falling sheet of circulating water and being quickly condensed. The steam condensed on the tubes falls into the chamber *L* and thence flows out through outlet nozzle *F* into the tail pipe and into a separate hot well.

The air is pumped out of the condenser at the nozzle located close to the cooling water inlet. This arrangement was adopted to secure the reduction in volume of the outgoing air which accompanies the lowering of its temperature. Otherwise an extra air cooler would have been necessary.

Mr. Kuylenstjerna mentions as some of the design

Rhode Island Wage Arbitration

Company's Brief Shows that During the Past Few Years Wages for Railway Employees Have Advanced Much More Rapidly than Those in Other Industries and Cost of Living—An Urgent Plea Is Made for a Substantial Reduction from the Present Scale

The Rhode Island Company presented its argument in the pending wage arbitration at Providence on Oct. 25, through James M. Swift of its counsel. James H. Vahey of Boston, Mass., submitted an argument on behalf of the union, and the case then went to the board for adjudication within thirty days. The company's point of view was presented in a printed brief of 168 pages, abstracted below.

The Rhode Island Company, incorporated in 1902, is the result of several operating consolidations comprising to-day 398 miles of track and furnishing transportation to about 90 per cent of the population of the State. It is at present operated by the federal government through a board of trustees holding the company's securities. If no purchaser for the company is found by 1919, the company, if in existence, is to be sold at auction. The trustees are charged with the double responsibility of providing efficient transportation service and of preserving the integrity of the system itself, which centers in the city of Providence.

The local division of the Amalgamated Association began its activities in 1912, and in July, 1913, a working agreement was effected covering thirty sections bearing upon wages, hours and conditions of labor. At the recent hearings Secretary Daniels of the union testified that since the organization of the union the men have more favorable conditions of working and higher pay than ever before, justifying the inference that in negotiating the 1913 agreement the union was fully conversant with the needs of its members and that the agreement fully satisfied those needs. So satisfactory was the agreement that when the company and the union met in conferences this year at its expiration to consider whether its terms should be changed it was agreed that, except as to wages and guaranteed hours to spare men, no alteration should be made. No agreement as to wages and hours could be reached, and arbitration was agreed upon. Because the company would not consent to let the union name all three arbitrators, a strike resulted in July, 1915, resulting in disorder, serious inconvenience to the public and heavy additional loss to the company, already staggering under an acute falling off in its earnings. Public opinion, however, forced the union to a realization of the unfairness of its attitude, with the result that conferences were resumed, and the present board of arbitration was selected.

POINTS AT ISSUE

The subject-matter to be determined by arbitration is: 1. The rate of wages to be paid by the company to members of the union. 2. The number of hours, if any, to be guaranteed extra men for a minimum day's work.

The board of arbitration has no right to fix any scale of wages made conditional upon any co-operative plan or any scheme based upon the future earnings of the company. The award is to date back to June 1, 1915, and the agreement is to continue in force until June 1, 1917.

The arbitration board consists of Mayor Joseph H. Gainer of Providence, chairman; Henry F. Baldwin, representing the union, and Michael J. Houlihan, representing the company.

The company estimates that the demands of the union, based on the normal working year and excluding over-

time or bonus time wages, correspond to a total increase of \$567,479 per annum, classified as follows:

Seven-hour guaranteed day for extra men, \$108,085.
Motormen and conductors (including all blue-uniformed employees), based on minimum of 30 cents and maximum of 35 cents per hour, under four-year graduated scale, \$292,298 per annum. The present weighted average hourly rate is 27.85 cents; that demanded is 34.85 cents, an average weighted increase of 6.99 cents per hour, or 25.12 per cent.
Increase of 10 cents per hour for repair shop employees, \$43,624.
Increase for carhouse employees, \$23,342.
Increase for employees of power department, \$9,589.
Increase for employees in line department, \$8,379.
Increase for employees of freight department, \$20,792.
Increase for regular employees of track department, \$33,163.
Increase for irregular employees of track department, \$25,218.
Increase for employees of stores department, \$2,999.

COMPANY'S CONTENTIONS

The company contends that in view of the fact that the union has failed to prove either an increase in work or an increase in the cost of living sufficient to justify an increase in the present wage, and in view of the financial condition of the company, these demands are absolutely unjust and impossible. The company has requested the board to reduce the present scale of wages to that in force prior to the working agreement of July, 1913, viz., for blue-uniformed men, 22 cents to 27.5 cents per hour, with corresponding decreases in the wages of employees in miscellaneous departments. In considering this request, it is urged that the original offer of the company in conference to increase the pay of blue-uniformed employees contingent upon an increase in revenue, its offer of a six-hour guaranteed day to such spare men as were required to report and its failure in the early conferences to request a reduction in the wages of employees of the miscellaneous departments were in lieu of arbitration, it being distinctly stated that if arbitration became necessary the company would insist upon the requests now submitted to the board.

The company maintains: First, that all its employees now receive a wage sufficient to support an ordinary family in health and reasonable comfort; second, that the increase in wages of a great majority of the employees since the last fixation and before has been greater than the increased cost of living and that there has been no such increase in the responsibility and difficulty of the work as would justify an increase in wages; third, that the work performed by its employees is peculiar to a unique employment and does not severely tax the endurance of the men, in most departments calls for something less than ordinary skill, knowledge and intelligence, and involves comparatively little danger to life, limb and health; fourth, that the wages received by other workmen are not material in this case, and do not afford a safe basis of comparison in determining the wage in this occupation; fifth, that the wages demanded by the union are unreasonable, both from the standpoint of the company's financial condition and of local needs; sixth, that the issue is purely local, and that in its decision the board may not safely consider wages or working conditions of other street car companies or of other employments in other localities; seventh, that such evidence as has been introduced is material solely on the issues of wages and guaranteed hours, and that the board is limited to considering such evidence as indicates a change in conditions since July, 1913; eighth, that the union has shown no sound reason for instituting

a guaranteed number of hours for spare men, the company's experience showing with a similar guaranty that under local conditions it is impractical; ninth, that the financial condition of the company renders it not only unable to pay any increase in wages, but obliges it, if it is to continue to exist, to reduce its wages.

The argument sets forth in considerable detail the position that comparative evidence from other companies, as attempted by the union, is inconclusive in view of the entire insufficiency of data upon which to base parallels. Fred Fay, executive board member of the Amalgamated Association, stated in the Boston Elevated arbitration that the union has always contended that the wages paid in other cities was no criterion in determining what wage should be paid in any immediate locality requiring arbitration. International President Mahon stated at Rochester, N. Y., in an interview last month that what can be paid in one place cannot be standardized by what some other traction company pays somewhere else and that wages must be determined upon local conditions. By abandoning its former contentions and principles, states the brief, the association confesses its inability to establish its case in accordance with the principles on which other increases have been secured.

This cardinal principle of arbitration is recognized and followed by Justice Higgins, president of the Commonwealth Arbitration Court of Australia (Australian Builders' and Laborers' Federation v. Archer and 569 Others). In the controversy between the Pittsburgh Railways and the Amalgamated Association, Chairman Buffington found that there is no general standard of wages for street car men, but that each of our large cities has made such fixation on the basis of local conditions. Wages paid in one city afford little light on what should be done in detail in another. This finding was made without objection by either side to the introduction of comparative evidence.

DISCUSSION OF WAGE SITUATION

So far as motormen and conductors are concerned, the union evidence showing the wages of outside trades is immaterial. There is no similarity of work established, and the unit of comparison is the hour, day or week and not the yearly wage, which takes into account the most important element of constancy of employment. For these reasons the testimony of taxicab drivers is of little value. As to these it appeared also that their responsibility and skill are considered greater than the motorman's, because a license to operate is required. In the shop and miscellaneous departments, street railway service is peculiar to itself, by no means qualifying men to do general work of the same name outside.

Since 1907 union wages in the building trades have increased but 11.1 per cent, only 0.5 per cent faster than the cost of living for the period; and the wages of employees in the metal trades have increased 13 per cent, but 2.4 per cent faster than the cost of living. During the same time, the maximum rate per hour for motormen and conductors has increased 12 per cent, the minimum rate 12.5 per cent, the weighted average rate 13.9 per cent, the average rate per car-hour 20 per cent and the average wage per year 17.6 per cent, each unit of comparison being materially higher than the cost of living increase. The increase in the average wage per year, which is the proper measure of the living wage, shows an increase 7 per cent greater than the increase in the cost of living, an increase 4.6 per cent greater than the metal trades, and an increase 6.5 per cent greater than the building trades.

Since 1912 the average weekly wage of power-house men has been increased 7.7 per cent; of linemen, 23.8

per cent; of freight department employees, 7.5 per cent; of carhouse and repair-shop men, 13.3 per cent, and of trackmen, 25.1 per cent.

COST OF LIVING

The increase in the cost of living has been only 12.1 per cent since 1907. This increase now shows a break in its general trend since 1907 and indicates a gradual though as yet unascertainable decrease since 1914. As the average wage per year tends to increase because of the graduated scale and because the cost of living now tends to decrease, the margin between the two for 1915 will undoubtedly be substantially larger.

The company's argument contains an exhaustive refutation of the contentions of the union relative to the rate of increase in the cost of living since 1900. Only 319 of the present 2469 employees were in the company's or its constituent company's service at that date, less than 13 per cent of the present employment. The remaining 87 per cent have no right to ask that their wage be now increased because of a change in the cost of living from a time before they were employed by the company. At that period many of them were but children, supported by their parents, and others employed in occupations which they later chose to desert for this. In the union figures, the period selected for a cost of living basis was admittedly the lowest-price era during all the time for which price records are now available. Using the union's own figures, the increase in food cost at Providence since 1899 is found, on careful analysis, to be only about 75 per cent of that claimed.

The company's brief states that the increase in prices arrived at by the union is fallacious. Food increases were derived from either old figures discredited as being of no present value by the government department which compiled them, so carefully selected that they are not representative, or spurious. Fuel costs were taken from wholesale figures; clothing figures employed were vague estimates, with limited items, while rent was largely a matter of guesswork. The union weighting of items does not agree with the weighting of the authorities referred to, and the new method of weighted index numbers standardized in government economic calculations was insufficiently utilized. Full particulars are given in the brief of the company's methods of calculating the cost of living increase.

WORKING CONDITIONS

The company contends that the work of its employees is virtually no harder than at the last fixation of wages and cites extended figures bearing upon traffic conditions, car service, etc., to prove this point. Compared with other companies cited by the union, the work of motormen and conductors, so far as affected by speed, density of population, annual car-miles operated per crew, revenue per mile of track, annual receipts per conductor, proportion of air-brake equipment, length of graduated scale, season peaks, transfers, etc., is in general easier on the Rhode Island system. It was shown that could the company place in effect its so-called "efficiency timetable," both regular and spare men would earn substantially more than at present, increasing the actual average of all men from \$729 to between \$791 and \$839 per year. The fact that some spare men have refused opportunities to go on the regular list indicates that there are some advantages in remaining a spare man, whether in pay, hours, or working conditions, and without a guaranteed number of extra hours. The amount for bonus time actually paid is \$9,090 per year more than the total for reporting time and accident reports. The percentage of inoperative Rooke fare registers per year is only 0.68 per

cent per conductor, or approximately one per conductor in each 1.5 years. During the fiscal year 1915 2,774,000 signal hours were operated. In this period there were 3312 signal-hours' failure, or 0.84 inoperative signal-hours for every 1000 signal-hours operated. This is less than one inoperative signal per motorman per year and shows the falsity of the motormen's contention that their work has increased because of the number of inoperative signals. Since 1913 the work performed by the blue-uniformed department has decreased between 3 and 4 per cent, as determined from passenger revenue per car-hour and from passengers per car-hour. The company claims that the occupation of motorman and of conductor is not a skilled occupation in the sense that the union defines the term.

FINANCIAL CONDITION OF COMPANY

Wholly irrespective of dividend requirements, the company contends that no increase in wages is possible, but that a reduction should be ordered. Its borrowing capacity is exhausted; the city of Providence has so far failed to relieve the road of any of its franchise obligations; there is no market for its stock; the lessor companies have the right to require the company to keep up maintenance under penalty of forfeiture of the lease; business depression, ruinous competition of jitneys and diminished growth of population, not anticipated—all these render it impossible for the road to increase wages under present conditions. No commission with authority to grant fare increases exists in Rhode Island. Before any change can be accomplished, it would be necessary for the city of Providence and other municipalities to forego their contractual rights under franchise agreements and for the Legislature to grant an amendment to the company's charter. As to the possibility of such an outcome, the members of the board are as well able to judge as counsel. Closing, the company holds that it has been shown that the men are receiving substantially more than a living wage and that the question is whether the men are entitled to more than their present adequate wage before the company is to be allowed to earn its necessary going expenses; "that is, whether the men are to be allowed to commit financial murder of the Rhode Island Company." The irresistible conclusion is that wages should be reduced.

Kansas Association Meets

The Kansas Gas, Water, Electric Light & Street Railway Association, at its annual convention in Topeka, on Oct 21, 22 and 23, changed its name, which had been somewhat of a misnomer, to the "Kansas Public Service Association." A committee on constitution was appointed, of which A. M. Patten, assistant general superintendent of the Illinois Traction Company, is chairman. The revised constitution will be submitted to a vote of the members within the next two months. The questions to be voted on will include a graduation of the fees in the manner similar to that of the N. E. L. A., the employment of a paid secretary, the establishment of permanent headquarters at Topeka and the making of Topeka the permanent convention city. One feature of the new constitution, which has already been practically determined, will be the elimination of the water and gas departments, which have heretofore taken little part in the association work and have been represented by a very small number of members. The program of the convention was very largely confined to subjects pertaining to commercial aspects of central-station operation.

The officers elected on Oct. 24 were: President, A. H. Purdy, Topeka; first vice-president, W. R. Wagoner,

Salina; second vice-president, R. G. La Fite, Eureka; third vice-president, W. J. Welfelt, Winfield; secretary, E. A. Wright, Manhattan; treasurer, J. D. Nicholson, Newton.

Fourth Congress of National Safety Council

The fourth annual safety congress of the National Safety Council was held at the Bellevue-Stratford Hotel, Philadelphia, Pa., on Oct. 19, 20 and 21. A general session of the association was held on Oct. 19. This was followed on Oct. 20 and 21 by sectional round-table meetings covering various branches of industrial activity. Of greatest interest to the readers of the *ELECTRIC RAILWAY JOURNAL* were the public utilities round-table sectional meeting and the railroad sectional meeting, both held on Oct. 20. At the public utilities meeting E. C. Spring, assistant to the president Lehigh Valley Transit Company, Allentown, Pa., gave an extemporaneous talk on "Hazards of Street Work," and F. J. Warnock, claim agent Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, discussed "Education of Street Car Platform Men." At the railroad sectional meeting C. W. Wilson, claims attorney Delaware, Lackawanna & Western Railroad, discussed "Public Safety and the Railroads," and J. C. Ross, chief claim agent Pennsylvania Railroad, considered the subject of "Automobile Grade Crossing Accidents."

More than 2000 delegates attended the sessions. Forty-seven railroads were represented. In connection with the congress there was a display of safety-first posters, showing virtually every type of industrial danger point and how to avoid it. This included a photographic collection portraying hundreds of appliances for guarding against injury to the worker from machinery.

One of the most important things accomplished at the congress was another step forward in the plan to establish permanent sections in the organization. These would include representatives of allied industries with special problems and hazards. The railroads had accomplished this prior to the congress just ended, and it is expected that other industries will perfect plans before the next annual meeting. The railroad organization originally started was known as the American Railway Safety Association. It is now affiliated with the National Safety Council, making up the steam railroad section. R. W. Campbell, the retiring president, said in his opening address at the congress that an invitation had been issued to the Safety First Federation, then in convention at Detroit, to join the council. The invitation was not accepted, the federation limiting its field to that of public safety. Hope for a union later was held out by Mr. Campbell. In the meantime a public safety section has been organized by the council.

The new officers of the council are Arthur T. Morey, assistant to the president Commonwealth Steel Company of Illinois, president; L. R. Palmer, Harrisburg, first vice-president; C. W. Price, Madison, Wis., second vice-president; E. R. Wright, Chicago, third vice-president; W. H. Cameron, Chicago, secretary-treasurer; Marcus A. Dow, New York, general safety agent New York Central Lines, director of exhibits.

The new members elected to the board of directors follow: H. A. Bullock, George T. Fond, C. H. Howard, L. A. Larsen, H. W. Moses, E. K. Prichett, S. F. Shattuck, J. C. Smith, L. B. Somerby, L. A. DeBlois, Dean Clifford B. Connelley of the Carnegie Institute of Technology; Dean L. E. Reber of the University of Wisconsin; J. M. Guild and Sidney A. Johnston. The new members of the executive committee are Dean Connelley, Mr. Prichett, Mr. Shattuck, Mr. Moses, Stephen W. Tener and Mr. Dow.

Efficiency in the Stores Department

The Writer Discusses the Best Location of Main and Auxiliary Stores, the Advantages of a Mnemonic System for Layout, the Use of Non-Rigid Bins and Stores Accounting in General

BY WILFRED G. ASTLE, STOREKEEPER TORONTO ELECTRIC LIGHT COMPANY, FORMERLY WITH THE DOMINION POWER & TRANSMISSION COMPANY, HAMILTON, ONT., AND THE CANADIAN PACIFIC RAILWAY

The handling and care of material and supplies in stores have become a matter of very great importance for it is now being realized that material is nothing else but a direct representation of cash and should be treated and handled as carefully as if it were actual cash.

If one has no orderly method of looking after material in stock there will always be danger of serious and costly losses, duplication of material ordered and the tying up of unnecessary capital. An efficient method, therefore, means the elimination of needless waste of material and time and the adoption of methods for quick handling and accounting of stock. This type of system has been the means of making great savings wherever it has been intelligently used.

The objects and purpose of a stores system are always to have on hand the proper amount of materials to meet the regular requirements, while keeping the stock as low as is consistent with the time and cost of replacement, to care properly for the materials so that they can be given out promptly with a minimum cost for distribution, to know what materials are required to keep work going in the most efficient manner, and to determine what kinds and quantities of materials are on hand at the time that work is put in process.

PHYSICAL ARRANGEMENT

The physical arrangement should be such that all material can be easily received and distributed when required. It should also have the proper facilities for preserving the condition of the material and be kept safe from disturbance by outside parties.

A space should be laid out near the entrance of the storeroom for receiving materials, and also for sorting and checking before they are placed in the bins or racks. A space in which outgoing material may be temporarily placed should also be laid out. These two spaces should be separated so that it will be impossible to make mistakes as far as incoming and outgoing material is concerned. The provision of these two spaces will facilitate the work and allow the material called for by stores requisition to be made ready in advance of the time that it is actually required.

In laying out the space required for any particular kind of material, the needs of each department should be studied, and standards of maximum and minimum quantities established. The space should be arranged according to the kind of classification used, so that all of one kind will be together and those of similar kinds next to one another.

The most satisfactory arrangement of storage racks or bins is that where the standard size steel equipment is used, which is provided with means for subdividing and resubdividing on the unit principle (see illustrations). Thus a small bin can be had simply by slipping into a large bin one or more smaller units, whereas if more space is required for a particular material it is necessary merely to remove the unit subdivision. If the materials are arranged according to some type of mnemonic classification, it will not be necessary to number the bins in any way. If the material is of a class that does not permit this arrangement to be satisfac-

torily used, it will be necessary to number the bins and sections and to maintain a bin index.

The location of the material in the storeroom should be arranged with regard to the nature and the frequency with which it will be handled. If it is handled many times it should be stored near the department where it is to be used. If it is handled only occasionally it can be stored in the basement or a shed outside of the regular storeroom building. Consideration should be given to such features as protection from the weather, theft, fires, dampness, unusual dryness, etc. The location and arrangement should be further governed by the fragility, value, weight and the bulk of the material. Consideration of these features will determine what facilities should be provided for handling, sorting and

STORES DEPARTMENT—STEEL SHELVEING OF ADJUSTABLE TYPE

arranging the materials and just what provisions for light and heat will be required.

Small materials of great value should be stored in an especially safe place, such as a vault, where protection against fire and theft will be absolute. Materials of a delicate nature should be protected from dampness, and materials that suffer from unusual dryness should be stored in a properly humidified room. Stock such as oils, paints or others of an inflammable nature, should be stored so as to be protected from danger of igniting themselves, and also so as to avoid adding any undue risk to the remainder of the plant. Fragile material should be stored so that it will not come in contact

with heavier or coarser materials. Unusual weight either of the individual parts or of the great quantity of material stored will necessitate the location of the storeroom upon the ground floor in order that ample support may be provided without any undue expense for strengthening the floors and walls of the building. If the materials are light and easily handled and are kept in relatively small quantities, they can be stored in almost any convenient location.

MNEMONIC SYMBOLIZING OF THE MATERIALS

The operation of any storeroom as well as the entire system will be simplified if some form of mnemonic classification is used. The object of a symbol system in the classification of the material is to furnish a shorthand method of designation. The symbols should contain suggestions and aids to remembering the names of the articles, so as to make it as easy as possible for a person knowing nothing about the system quickly to locate the material in the classification, after spending a few minutes in receiving explanation or studying the primal elements of such symbolization. This symbol system should be so constructed that it will be complete, simple, flexible, uniform and conform to all other symbol systems used in other parts of the plant. Therefore, it is best when considering the installation of such a system to map out in advance all the general classi-

article that the material is used for, to cover stores used exclusively for that work, as for example:

- SA—Stores used for armatures
- SB—Stores used for car bodies
- SC—Stores used for controllers
- SM—Stores used for motors
- ST—Stores used for trucks.

Such material which is carried in stores and used for a number of purposes, apart from that which is used for certain specific work only, should be classified under "V"—"SV" meaning "Stores used for various purposes."

The third letter should signify the nature of the material and should be used regardless of whether the second letter is "V" or one of the others, indicating the general classes of work. For example, "STC" would mean "Castings for trucks in stores," and "SVC" would mean "Castings for various purposes in stores." The fourth letter of the classification is the general subdivision of the three-letter symbol. For example, under "SVC" would be given:

- SVCA—Aluminum castings
- SVCB—Brass castings
- SVCS—Steel castings

etc., and under "SVB," meaning "Bars for various purposes in stores," would be given:

- SVBB—Brass bars
- SVBC—Copper bars
- SVBM—Machinery steel
- SVBP—Pipe, tubing, etc.
- SVBR—Cold-rolled and cold-drawn steel
- SVBY—Babbitt metal.

The fifth letter of the symbol should be the particular kind of article in the subdivision shown by the fourth letter. For example, "SVB," meaning "Bars for various purposes in stores," in which would be "SVBB," meaning "Brass bars for various purposes in stores," would be given:

- SVBBF—Flat or rectangular brass bars
- SVBBH—Hexagonal brass bars
- SVBBN—Octagonal brass bars
- SVBBR—Round brass bars
- SVBBS—Square brass bars
- SVBBT—Triangular brass bars, etc.

If a further subdivision should be necessary to describe an article fully a sixth letter can be used. This sixth letter should indicate the different makers of the five-letter symbol, and should be if possible the initial of the manufacturer's name or trade name of the article. After the last letter should be given the size of the article. In giving size, absolute uniformity should be followed as to dimensions indicated by the relative position of the figures.

When three figures are used in giving dimensions, they should be given in the order of thickness, breadth and length. When one dimension only is given, it should indicate thickness or diameter. If two figures are given, the thickness should be given first and the breadth last. In the case of cylindrical articles, the first figure should be the diameter and the last figure the length, and with tubing the first figure will be the outside diameter, the second the gage or inside diameter, and the third the length. It does not matter very much whether this or the opposite method of designating dimensions is used, as there are good points in favor of both, but it is most essential that some one method be adopted for general use.

It is better, except possibly in very rare cases, to make the general classification by the shape of the material; for example, as shown in the subdivision of "SV"—all bars are given in one group no matter what the material, whether hollow bars, such as pipe and tubing, or

STORES DEPARTMENT—STANDARD SHELVING WITH EXTENSION SHELVES

fications that will be required in order to insure a uniform system.

The letters used to denote any particular article or division in the classification should primarily be the initial letter of the name of such article or division, so that in reading the symbol the thought first goes to the letter shown as the initial of the required word. In cases where the initial letter has already been used for another article or division the secondary letter should be used. This secondary letter should be the letter which, aside from the initial letter, has the most prominent sound and consequently would be secondmost prominent in the thought of the person reading the symbol.

The first letter used for all general stores symbols is "S," meaning "Stores," and this letter as the initial letter of a symbol should be omitted from all other classifications so that all symbols beginning with "S" will indicate that it is general stores, or material purchased from outside. The second letter should be the initial letter of the name for the particular work or

iron bars. The reason for this is that it is most convenient to store all these articles in one section of the storeroom in racks built for bars. This makes it easier to locate the material by the symbol when all such material is stored in one place, the storage properly sectioned off according to subdivisions of the general class, than it would be under the method of keeping all brass and brass products under one general class, copper, steel, wrought iron, etc., and products of same under another general class.

METHOD OF OPERATION AND USE

Materials that are received from outside of the plant should pass through the receiving department, where they should be thoroughly checked. The receiving clerk should then sort the various kinds of material, attach the lot tag showing symbol, quantity and date received, and enter each item on a receiving report, showing symbol, quantity, date, and from whom received. As the materials are received they should be distributed to the proper bins and the quantity and date received entered upon the bin tags.

If the storeroom is operated on the double-bin system, the main bin, assigned for a particular kind of material, should be divided into two parts. In each part should be placed the standard quantity, and the tag attached to the materials by the receiving clerk should be placed on the hook for that section of the bin. Stores requisitions should then be filled from one section of the bin, until that quantity is exhausted, at which time the bin tag for that section should be taken off and sent to the storekeeper as a notice that the quantity on hand has reached the minimum and that an order for the standard ordering quantity should be placed.

Any stores requisitions received after that should be filled from the other division of the bin. The maximum and minimum quantities should be so fixed that there will always be a part of a lot in one section of the bin. It is seldom necessary to carry more than two lots at any one time, that is to say, one complete lot in each section of the bin.

When the materials are such that the amount on hand is subject to great fluctuation in quantity, or is not carried at all during certain periods of the year, it is more economical of space to arrange them in bins that may be available at the time. In such a case it is necessary that the bins should be numbered and a bin index showing location of each kind of material should be maintained.

Under the single-bin system these maximum and minimum quantities are carried on the balance-of-stores

sheets, while with the double-bin system, the minimum is one lot, the ordering quantity one lot and the maximum that seldom will be exceeded is two lots.

REQUISITION AND RECEIVING FORMS

To make intelligent purchases the purchasing agent should be guided and directed by specifications in every instance. The storekeeper should be responsible for the specifications drawn up from which the purchasing agent is to act, because he should be familiar with exactly what is required.

As material of any kind is required it should be indicated to the purchasing agent through the medium of the general requisition for purchasing, as reproduced. No matter by whom these requisitions are made they should first be passed to the storekeeper, who should check them to determine whether he has or has not any or all of the materials required on hand or on order, after which he should pass the original to the purchasing agent and retain the duplicate for his records. This mode of procedure gives the storekeeper absolute control of the amount of materials on hand.

In every case these requisitions should state the purpose for which the materials or supplies are required as well as by whom wanted, and material of two different classes should not be listed on the same requisition.

In the organization of the stores department it is necessary to provide for a record of the receipt of all material and supplies. The system must be so constructed that it will not only insure a record of all material coming into the storeroom, but prevent the acceptance of material which should not be received. This receiving report, as reproduced, should be made out in duplicate, the original to be forwarded to the purchasing agent and the duplicate retained by the storekeeper. Upon receipt of this form the purchasing agent will bring together all papers dealing with the transaction, namely: Original copy of receiving report, copy of purchase order, original copy of requisition, invoice from the dealer.

This will enable the purchasing agent to verify the invoice and approve it for payment. It also enables him to settle all questions of differences as to quantity, price, etc., before entry is made in the stores ledger, and in this way makes the inventory records absolutely reliable.

STORES DEPARTMENT—STOCK REPORT

STORES DEPARTMENT.		Dept. No. _____	
The following material received on order No. _____		Date. _____	
has been transferred to order No. _____			
Foreman. _____			
Quantity	Description	Cost	Value
Date Entered. _____	Stockkeeper, _____		

STORES DEPARTMENT—STORES REQUISITION

of the material, the quantity and any other particulars necessary. After these requisitions have been filled by the stores clerks they should be passed on to the stock record clerk, who should number each requisition consecutively and enter each item on his records, after which he should forward the original to the accounting or cost department and retain the duplicate to be filed under the account chargeable.

When a foreman receives an order to do certain work, he estimates the quantity of material required and draws it from the stores. He does not always estimate the exact quantity; he may be short or have material left when the job is completed. Unless this material can be used immediately on another job, it should be returned to stock with a report to the storekeeper, like that reproduced, showing the job or work order number for which the material was drawn. When the storekeeper receives unused material and this report, he will enter the quantity on the stock record sheets under the head of receipts, and then forward the report to the accounting or cost department.

When a foreman has left over material which can be used on another job, a report is necessary to insure credit to the job for which it was drawn and a charge to the job on which it was used. This form, which is reproduced, should show the numbers of the jobs for

The storekeeper should hold his copy of the general requisition for purchasing until he receives his copy of the purchase order covering the material, when he should file the two copies, namely, the copy of the general requisition for purchasing according to the kind of material, and the copy of the purchase order according to the name of the dealer. This will enable him to have a cross index to these orders.

As soon as the original invoice for such material has been checked, and entry made on the stores ledger, the storekeeper should file under "Orders Filled" all papers pertaining to the transaction in his department under the proper purchase order number and should keep a record of the names of the dealers to whom the orders have been given.

The stock record form reproduced is provided to show the complete status from a storekeeping point of view of every kind of material bought from the outside for use in the manufacture of any product and the upkeep of the plant. A separate sheet should be provided for each different kind of material, and should show the full description of the article and where located, as well as the established maximum and minimum quantities. It should also provide a record to enable the storekeeper to know not only the material he has on hand, but what he has on order, so that he can intelligently forecast his future requirements at any time and issue the necessary requisition on the purchasing agent to keep up his stock.

No material should ever be given out without a stores requisition, like that reproduced, showing the symbol

Form No 142. 3m-3-14 B. & S. 32870

Date 19

To the Storekeeper:

Please receive the following material and credit to

Foreman on job Signed by

STORES DEPARTMENT—MATERIAL RETURNED TO STOCK

which the material was drawn and to which it was transferred. After entering the correct quantities on his stock records, the storekeeper should forward this report to the accounting or cost department. If it is not considered necessary for the storekeeper to make these corrections in his records, the report may be sent direct by the foreman.

If the stores department is properly maintained, the following results will be obtained which will more than pay for the operation of the storeroom and give facts and information which cannot be obtained in any other way:

The elimination of waste due to improper care, and to carrying over from year to year stock which has become obsolete, instead of disposing of it or using it at a time when it is of value.

Materials will be ready when wanted and will be available in such quantities as are needed.

Ability to fix responsibility for errors.

The prevention of tying up material and labor in process on account of the shortage of some article which has not been provided.

Ordering and purchasing material become a matter of routine nature.

The amount of space required for storage will be less under a proper stores system because the amount carried will be smaller and the arrangement more economical, and the consequent overhead charge for floor space will be reduced accordingly.

The better care of materials of all kinds.

Ability to replenish stock automatically without unnecessary delay when it is getting low.

The prevention of tying up material in excessive quantities and a consequent saving in the money invested in the material and in the interest charge on this money.

The maintenance of a balance sheet which shows not only the amount on hand in the storeroom, but the amount ordered, the amount available for future orders and the amount which has been drawn out for use during any period.

Simplicity of control with less labor to operate and a consequent smaller cost for handling the same amount of material.

If the system is properly maintained with competent help, the taking of the annual inventory becomes an easy and also an accurate matter. It consists simply of transferring from the balance sheets to the inventory sheets, the quantities in the storeroom, the quantities in process and the cost or value. This method is perfectly practicable, but in order to obtain accuracy the help in the storeroom must be competent and all work should be checked and inspected in a routine manner. A schedule should also be drawn up whereby the number of items in stock is verified every day.

Bonus Earned in Manila

Based on the saving in coal, the plan of a bonus system of wages, which was established on June 1 for the power plant employees of the Manila Electric Railroad & Light Corporation, Manila, P. I., has proved satisfactory to both the company and the participating power plant employees. The total amount of bonus earned by eighty-two employees during June was \$209, which is at the rate of approximately \$2,500 per year and equivalent to a 10 per cent increase in the wages of the employees. The value of the coal saved to the company was \$417, representing 3.3 per cent of saving effected over the prescribed standard.

In the operation of this bonus plan the standard basis of coal consumption per kilowatt-hour at the switchboard is 3.5 lb. A total of 50 per cent of the value of the coal saved on the basis of 3.5 lb. consumed, based on 11,715 B.t.u. per pound of coal or 41,000 B.t.u. per kilowatt-hour at the switchboard, is distributed to certain participating power plant employees. In figuring the coal consumption the actual weight of the coal consumed is taken, and 1 per cent is added to cover possible

errors or omissions in weighing and possible losses of coal consumed in the pile by reason of spontaneous combustion.

In distributing the bonus, a system of points is used. The chief engineer of the power plant, who does not participate, determines the schedule of points to be allowed the different occupations of the different employees, based on the relative value of their services. He also establishes a schedule of penalties to be applied to the schedule of points. The point arrangement as now constituted is as follows for each day's work: Superintendence: assistant chief engineer, 40; foreman, 20; chief coal checker, 5; assistant coal checkers, 3; clerk, 5; engineers, 20; oilers, 3. Switchboard tenders: tenders, 5; helpers, 3; firemen, 6; coal passers, 3; water tenders, 10; watchmen, 2; other labor, 2. Mechanics and helpers: foremen, 15; mechanics, 5; helpers, 3; laborers, 2; construction and reconstruction, 2. Total, 154 points.

Attractive Street Railway Shelter in Worcester, Mass.

An unusually attractive shelter for street railway passengers has been erected by local real estate interests at Chamberlin Parkway, in the Lenox district of Worcester, Mass. This section of the city is one of the latest and best residential areas undergoing development, and the shelter, while distinctly of the open-air type, lends considerable architectural value to the neighborhood. It is a concrete structure having a timber

STREET RAILWAY SHELTER IN WORCESTER, MASS.

roof with copper flashing and it contains two seats 9 ft. 6 in. long, 18 in. wide and 16 in. high. The roof is supported by six concrete pillars, and the ceiling consists of concrete panels molded between wooden beams. Flower beds and shrubbery, together with a curved stone coping and neat wall, complete the structure, which, however, is supplemented by two open concrete seats on either side of the parkway as shown in the accompanying illustration.

Primary Mercurial Resistance Standards

The bureau of standards of the Department of Commerce has recently issued scientific paper No. 256 dealing with the construction of four standard ohms. The work consisted in the construction of mercury columns in glass tubes, the columns being constructed to have a constant cross-section, a mass of 14.4521 grams and a length of 106.3 cm. at the temperature of melting ice. Such a column has a resistance of 1 ohm as defined by the International Congress on Electrical Units and Standards held in London in 1908, and since internationally adopted. So accurate was the work of construction of the four standards that the average deviation of their individual values from their mean value is less than 0.00001 ohm.

B. J. Arnold Restates His Views on Municipal Ownership

He Says Its Disadvantages Are Too Obvious to Require Reiteration

In some of the reports in the daily papers of the address by B. J. Arnold at the San Francisco convention the statement was made that Mr. Arnold approved the policy of municipal ownership of electric railways. Such an idea could have been obtained only by taking a very distorted view of what Mr. Arnold said. To clear up the situation, however, Mr. Arnold, while in Los Angeles, was interviewed by a representative of the *Los Angeles Times*. In this interview, which appeared in the issue of that paper for Oct. 15, Mr. Arnold is quoted as having stated as follows:

"The reports which made me say in an address before the American Electric Railway Association at San Francisco that municipal ownership of utilities is inevitable are incorrect. What I did say was: 'Let us spend no more time worrying about whether immediate municipal ownership or ultimate municipal ownership is the thing the people want. Chicago once tried to get municipal ownership, but failed because the city could not raise the money, and a study of the indebtedness and bond limits of other cities present like conditions.'

"Time will therefore settle whether the immediate municipal ownership or the ultimate municipal ownership plank, or neither, is to go into municipal platforms. The point I want to make is that we cease wasting our energies in opposing a public movement that will surely come, in spite of opposition, if it is economically sound, and direct our energies toward the terms of the purchase clause and the conditions of a resettlement franchise.

"It is time for us to prove to the courts and commissions that railway investment can be made practically as sound as what are termed savings bank investments. Several plans have been worked out, notably those which are included in my reports on Chicago, Kansas City and San Francisco. They differ somewhat in franchise conditions, but the central idea is to put tangible property behind intangible values, so that if ultimate municipal ownership should prove to be the policy of the country, it will come without destroying investment values, or curtailing service to the public during the time of its coming."

Speaking further on the same subject, Mr. Arnold said: "The only advantage of municipal ownership and operation over private ownership, from a financial standpoint, is the ability of a municipality, in most cases, to borrow money at a lower rate of interest than private corporations or individuals are willing to accept for their money when it is to be invested in public utilities.

"Therefore, if the municipality will operate an electric railway as efficiently and as economically as a private corporation, the municipally-owned and operated railway will be the cheaper to the community.

"But the question is: Will the municipality so manage the property? Inasmuch as the margin is only the difference in the cost of money, it may easily be absorbed by inefficient management, through the loading of the municipally-operated road with excessive operating expenses in the way of labor and other considerable items that may enter into the management.

"The San Francisco experiment is being watched closely and up to date it has been conducted and operated efficiently and honestly, although there has already been a tendency toward the construction of unprofitable extensions and toward a reduction of the fare. The question is whether the municipality will continue to manage the property as well as it has in the past.

"The advantages that I have pointed out above are purely theoretical advantages. I cannot emphasize this too strongly. In many cases they have proved to be no advantages at all in actual practice. The disadvantages of municipal ownership are too obvious and too well known to require reiteration."

Power Station Organization on Bay State Street Railway

An interesting feature of the Bay State Street Railway wage arbitration was the testimony of C. F. Bancroft, superintendent of motive power and machinery, relative to the administration of the company's great system of power plants. The power for 941 miles of this company's track, for the carhouses and shops and for the commercial electric lighting systems of New port, R. I., and Portsmouth, R. I., is furnished by fifteen generating stations and six substations. In these plants are sixty-three main generators of 44,855-kw. capacity and thirty-three rotary converters of 16,450-kw. capacity, ninety-three boilers of 33,215 hp., and sixty engines and turbines of 66,325 hp. combined rating. These generating stations annually consume about 151,000 tons of coal, and 405,000,000 gal. of feed water and their output is 121,397,000 kw.-hr. About 240 men are employed, the fifteen generating stations being operated by crews of from six to forty-five men under the supervision of a chief engineer. The six substations are operated by crews of three or four men, including a foreman.

The operation and maintenance of all power stations and substations are in direct charge of a superintendent of power stations, with the exception of central stations at Newport and Portsmouth, which report to the superintendent of motive power and machinery through another channel. The superintendent of power stations supervises the installation of all new power plant machinery and makes yearly recommendations for additional requirements. All repair work, including labor and material, except ordinary routine maintenance, is authorized and supervised by this officer. He makes a monthly report to the superintendent of motive power and machinery covering the operations of each plant, and makes special reports of all accidents and abnormal occurrences.

The assistant superintendent of power stations for the southern division has charge of five substations, directing the work of each through its foreman. He is in charge of the installation of all new substation machinery and repairs and takes charge of all plants on the southern lines in the absence of the superintendent of power stations, with the exception of the two stations in Rhode Island which have been previously mentioned.

On the northern lines, where practically all the plants are of the d.c. type, the assistant superintendent of power stations is chiefly occupied in directing and supervising new plant construction, testing machinery, supervising draftsmen and making special reports in relation to equipment.

Thirteen chief engineers are employed on the system, each in charge of a plant and reporting directly to the superintendent. With this officer's approval they employ and discharge all help at their respective stations; make all requisitions for materials and are responsible for the proper care, use and accounting for material. All routine repairs are directly supervised by the chief engineers, and at the Quincy and Chelsea power stations, where coal is discharged, the chief engineers also supervise the discharging and storage of coal.

The Graded Wage Scale

BY W. J. SHERWOOD, SUPERINTENDENT OF TRANSPORTATION MOBILE LIGHT & RAILROAD COMPANY

The question as to the length of service on the wage scale of trainmen has been in frequent evidence of late. Some representatives of labor organizations have made the claim that at the end of his first year of service a motorman is as fully qualified in the work of running a car as he ever will be and that commencing with the end of that period he should receive maximum pay per hour worked. Such contention being contrary to my experience led to a further study of the question, and, in the course of it, a statement was compiled of accidents that occurred on this system during the years of 1913 and 1914, account of which settlements had been made to June 30, 1915. The costs of these settlements were then grouped according to the grades of service of the trainmen concerned.

An abstract of the complete report is given below, and an examination of it will, I think, conclusively show that so far as this company is concerned the men in the

PERCENTAGE STATEMENT OF SETTLEMENTS MADE ACCOUNT OF ACCIDENTS THAT OCCURRED IN 1913 AND 1914, MOBILE LIGHT & RAILROAD COMPANY

Grade of Service of Trainmen	Percentage of Total Trainmen				Average Cost of Settlements per Car-Hour per Man	
	1913 Per Cent	1914 Per Cent	1913 Per Cent	1914 Per Cent	1913 Cents	1914 Cents
First year ...	43.6	37.3	57.25	75.73	0.0447	0.0446
Second year ..	16.0	17.6	29.18	15.11	0.0621	0.0189
Third year ...	11.1	12.8	3.74	0.48	0.0114	0.00083
Fourth year ..	8.0	9.5	4.26	1.89	0.0139	0.00433
Fifth year ...	4.1	4.7	1.67	0.15	0.0139	0.000719
Over five years.	17.2	18.1	3.90	6.64	0.0077	0.0081

second year of service were considerably below the full qualifications for their work and were not entitled to the same rate of pay as apportioned to men longer in the service.

There is a wide variance in the time required between the minority class of men who become proficient early and the majority class of men who slowly obtain from constant instruction and experience the ability to perform their work with reasonable care and safety, and the variations found make it difficult to determine the time when trainmen attain maximum efficiency.

If a complete record could be maintained and the grades of wage scale established upon the basis of individual performance a more equable adjustment of the question would result, but a plan of the kind would require prohibitive supervisory cost and is therefore economically impossible. The general practice of graded wage scale according to the years of service is the most practical one at hand, and that it contains the essentials of equity has been recognized many times by various boards of arbitration.

Protection of Steel Against Rust

At the recent convention of the Master Painters' Association P. J. Burns, foreman painter at the Hoboken shops of the Pennsylvania Railroad, stated that the initial rusting of steel invariably begins on the sharp edges and minute projects existing on the surface. This proves that it is practically impossible to obtain a uniform protection when a brush is used in applying paint to the surface. However, the lasting qualities of "smalted" signs indicate that by substituting a very fine sawdust for the sand used in that process, applying this in the same manner, and then painting over the sawdust, a very much better metal protective coating can be secured than by the direct application of paint. This scheme might be carried further by applying with a

coating of fresh paint a substance that will completely cover the metal and fill up all the small holes and cracks, forming a ground for the subsequent paint coatings. A large variety of materials may be used, such as abes-tine, cement or any inert pigment. The finishing coating can be made very heavy and applied freely so as completely to cover the surface that is being painted.

New York Railways Closes Power House

According to the annual report of President Shonts the Ninety-sixth Street power plant of the New York Railways will be closed for the present, except in rush hours during the winter months, owing to the fact that it can no longer compete in economy of energy production with the great power plants of the Interborough Rapid Transit Company from which the New York Railways now purchases its power.

The power plant was built by the Metropolitan Street Railway, the predecessor of the New York Railways, in 1898 and 1899. It was a famous plant in its day, the home of the General Electric generator of 3500-kw. capacity which in some quarters became known as the "Metropolitan" alternator. The power house is a handsome brick structure 201 ft. x 279 ft., containing eleven vertical, cross-compound Allis engines of 4500-i.hp. nominal and 7000-i.hp. maximum rating. These were the largest engines which had been constructed in the United States up to their time. The chimney also was a record breaker in its day, being the largest in the world and the tallest in the country. It contains 3,600,000 bricks and weighs 8540 tons. There are eighty-seven B. & W. boilers in three tiers in the plant, and above the boiler section are coal bunkers with a combined capacity of 9000 tons.

Three-phase alternating current at 6400 volts was furnished by the station, but, as M. G. Starrett, chief engineer of the company, said at the time, this kind of current was not decided upon without due consideration of the merits of the direct-current system. The station was designed for operation with a force of 180 men. The water required per kilowatt-hour at the switchboard was somewhat over 22 lb., including all auxiliaries and coal hoisting and stoking. The cost of the power station, including real estate, was nearly \$4,500,000, or about \$90 per indicated horsepower of capacity.

New York Railways and the Workmen's Compensation Law

On the subject of the New York workmen's compensation law the New York (N. Y.) Railways said in its pamphlet report for the year ended June 30, 1915: "The law has not been in operation long enough to form a basis upon which to calculate with exactness its annual burden upon the revenues, but it is apparent that our course in assuming as self-insurers the responsibility imposed by the law was wiser than to insure in the State insurance fund or with insurance companies. It is believed that our relations with our employees have been more satisfactory than they would have been had the matter of their disabilities been turned over to outside agencies. A competent and efficient medical staff was organized and in readiness when the law went into effect on July 1, 1914, to furnish every possible attention promptly to injured employees. Every effort has been made to prevent minor injuries becoming serious through neglect or improper treatment. The very best hospital and other facilities have been provided in all cases. While this has been expensive it is believed that it has been appreciated by our employees and that in the long run it will be found to have been justified."

American Association News

Public Service Section Hears Instructive Address by Noted Valuation Expert, Elects Officers and Reports Successful Year's Work—Denver Section Also Elects Officers—Milwaukee Section Had Excellent Program for This Week's Meeting

DENVER TRAMWAY COMPANY SECTION ELECTS OFFICERS

As announced last week, the regular meeting of the Denver Tramway Company section was held on Oct. 21. President C. B. Wells called upon R. W. Toll, chairman of the nominating committee, for nominations of officers for the ensuing year. The following were nominated and elected: President, W. G. Matthews, superintendent of overhead lines; vice-president, W. H. Seip, superintendent central division; secretary-treasurer, H. G. Mundhenk, transportation department; director for two years to take the place of W. G. Matthews, who was elected to the presidency, W. E. Casey, chief electrician. F. W. Hild became a director ex officio as he had recently become general manager of the company. A. M. Evans, engineering department, is the remaining director, whose term expires on Oct. 30, 1916.

Mr. Hild was called upon for a few informal remarks, and he delivered a very energetic and interesting address which was enthusiastically received by the audience of 700. Mr. Hild in turn introduced Dr. George B. Vosburgh of the University of Denver, who gave a beautifully illustrated lecture on "The Tramway and the Modern City."

PUBLIC SERVICE COMPANY SECTION

A meeting of company section No. 2 was held on Oct. 28 in Newark. Dean Mortimer E. Cooley of the University of Michigan addressed the section on the subject, "Fundamentals of Appraisal and Valuation." After the address H. D. Briggs, assistant general claim agent Public Service Railway, gave some interesting reminiscences of the San Francisco convention, at which he was one of four representatives of the company.

Secretary A. T. Warner gave a brief annual report containing the following data: The membership in good standing at this time is 290 as compared with 249 a year ago. The average attendance at meetings during the 1914-1915 season was 184 as compared with 128 for the preceding season. The present membership is divided among the departments thus: transportation, 90; maintenance of way and engineering, 49; mechanical, 37; auditing, 20; claims, 20; distribution, 16, and general, 58.

The election of officers resulted as follows: President, W. B. Graham, division superintendent; vice-president, R. H. Harrison, mechanical department; treasurer, T. J. Manning, accounting department; secretary (re-elected), A. T. Warner, cadet engineer, and trustee to serve for three years, H. H. George, assistant engineer maintenance of way. After the election the retiring and incoming officers made brief addresses, and resolutions of thanks to the former and expressing a spirit of co-operation with the latter were passed.

Dean Cooley began by explaining the difference between an appraisal and a valuation, the former being simply a priced inventory of a property. The latter may include the former but may include other items as well. The first appraisals were made to determine sale prices, particularly of water works. Another purpose of early appraisals was in connection with taxation, an

example being furnished by Michigan where, in 1900, the railroad property was appraised in order that taxation might be put upon an ad valorem basis. More recently appraisals have been made to justify or serve as a basis for the issuance of securities and as a basis of determining rates.

In appraising a property two elements are involved; first, the determination of the cost of reproduction new, that is at present prices of materials and labor, and, second, the determination of the physical condition of the property.

Dean Cooley then explained in detail the elements which go to make up the value of the property emphasizing the importance of the intangible elements. He said that the intangible elements may include items very difficult to determine, such, for example, as the value of a building razed to make way for an improvement. He also urged the keeping up of the property in the most economical condition, which averages about 85 per cent of the condition new.

He gave the following example showing estimated subdivision of the total cost of a mile of track:

Total cost	\$100,000
Preliminary expense	750
Physical property, cost.....	75,000
General contingencies	4,500
General engineering	4,000
Insurance and taxes	1,750
Organization, administration and legal.....	2,000
Cost of promotion	750
Interest during construction	7,000
Stores and supplies	1,000
Working capital	3,000
Office furniture	250

Dean Cooley stated as the elements of depreciation the following: Wear, decay, obsolescence and inadequacy. Of these the former two are easy to determine, but the latter two are not, as they involve a psychological factor.

MILWAUKEE COMPANY SECTION

The regular meeting of The Milwaukee Electric Railway & Light Company section was held on Oct. 28. Papers were presented on the following subjects: "Standardization and Specifications for Employees," "Standard Rules for Operation of Electric Railways" and "Review of Technical Press." Further details of the meeting will be given in a later issue of the ELECTRIC RAILWAY JOURNAL.

Safety Measures at Way Stations

Possible accidents to passengers at way stations on the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., have been minimized by putting the passenger or unloading platforms, which are rail height, on one side of the track, and the express and milk platforms, which are car-floor height, on the opposite side. At points between Gary, Ind., and Pullman, Ill., however, this arrangement was unnecessary, because all platforms are car-floor height. In case a passenger hurriedly attempts to board or alight from a moving car at a station, this platform arrangement makes it impossible for him to be struck by the elevated platform.

COMMUNICATIONS

Wheel Diameter and Motor Heating

THE OHIO ELECTRIC RAILWAY COMPANY
COLUMBUS, OHIO, Oct. 18, 1915.

To the Editors:

I wish to congratulate Mr. Broomall on his article on "Effect of Car-Wheel Diameters on Motor Heating," published in the Sept. 11 issue of the *ELECTRIC RAILWAY JOURNAL*, page 452.

This is the kind of article that I have been looking for for some time. The men in charge of equipment

DIFFERENCES IN MOTOR HEATING DUE TO DIFFERENCES IN WHEEL DIAMETER

need to know what the heating effect and consequent damage to motors will be if the wheel diameters are allowed to differ by a certain amount, under certain prescribed conditions. These data can now be secured by reference to the accompanying curves which are given in Fig. 3 of Mr. Broomall's article. The fact that all values are worked out in percentages makes them applicable to all classes of motors and to all sizes of wheels, so that by the use of Fig. 3 anyone can work out the allowable limit of difference for any service.

For some time the writer has made it the rule not to allow more than 1-in. difference in diameter of wheels on interurban cars. To test the correctness of this ruling he applied the curves to the following case: Quadruple equipment of Westinghouse No. 303-A motors, of which the one-hour rating speed at 500 volts is 580 r.p.m.; gear ratio, 25:52; car operated at an average speed of about 28 m.p.h.; average voltage on trolley, 500. On three of the motors the average wheel diameter is 36 in., and on the fourth it is 37 in. As the normal, or one-hour rating speed of the motor is 580 r.p.m. at 500 volts, this will correspond to a car speed of 31 m.p.h. at the one-hour rating for the 37-in. wheel. A difference of 1 in. in wheel diameter is about 2.7 per cent, and 28 m.p.h. is about 90 per cent of the one-hour rating speed. Applying these data to the curves we find that the motor geared to the 37-in. wheels will have about 10 per cent greater heating effect than the average of the other motors. This 10 per cent, unless the motors are already overloaded, will generally do but little harm, therefore the 1-in. difference seems to be a fairly safe one for cases similar to the one cited.

Mr. Broomall's article points out very clearly that the question of difference in wheel diameters is of much greater importance when the car speeds are low than when they are high. One meaning of this is that for cars used for local service the sizes of wheels should be kept nearer together than is necessary on fast or limited service.

In order to see what would be the effect of a difference of 2 in. in wheel diameter at the same speed in

the above problem, the curves were again applied and showed an increase of 20 per cent in heating effect for the motor with the large wheels or double the percentage found with 1-in. wheel difference. With an average speed of 42 m.p.h., or about 135 per cent of 1-hr. rating speed, this heating difference falls again to about 10 per cent, so that a difference in diameter of 2 in. at an average speed of 42 m.p.h. in this equipment would be about as safe as a difference of 1 in. at 28 m.p.h.

F. J. FOOTE, Master Mechanic.

Cars at Less than Cost

NEW YORK, Oct. 21, 1915.

To the Editors:

One feature of the recent discussion in the columns of the *ELECTRIC RAILWAY JOURNAL* concerning the question of "cars at less than cost" should receive additional emphasis. It is the adherence to certain types of cars on the part of individual companies, as mentioned in Mr. Storer's letter, published in your issue of Sept. 25. As has been stated in the *JOURNAL* before, it is not uncommon for some managers who are asked to give the reason why some progressive step is not taken or some widely adopted standard is not used on their property to take refuge behind the worn-out phrase "local conditions." In most cases it would probably be found that the reason that special types of cars are on individual properties is the personal opinion of some one individual.

There is much truth in the statement made by Mr. Storer, that a large part of the cause for the higher price of rolling stock is to be laid at the doors of the individual managers and operators of railway properties. Is it not possible to substantiate this deduction from the developed experience of the steam railroads? They have practically a standard type of car for general passenger service that is in use all over the country. This particular type of car is not desirable for city electric railways, but some one or two of the several types now being exploited on the streets of different cities could be adopted almost universally for urban use, provided the operators and managers of the companies could be weaned away from their own prejudices and an exaggerated idea of the controlling importance of their "local conditions."

It is not desired nor desirable to destroy initiative, but fads and personal notions can be carried too far, and what may be called "local standardization" can become very expensive to the industry, as has been clearly pointed out in the letter referred to.

Does not this discussion point to a work of great potential value to the electric railway business which the American Electric Railway Association could undertake? The Engineering and Transportation & Traffic Associations might well formulate and develop in conjunction with the manufacturers of cars and car parts a few standard types for general use.

For example: If the center-entrance car is found advantageous on properties having such varied and dissimilar conditions as Brooklyn, Pittsburgh, Cleveland and Denver, and has worked out so successfully in these cities that this type of car has practically been adopted as standard, it would seem that this fact should be a guide to the purchase of new equipment for other good-sized towns and cities. Here, however, the conservatism of the individual manager steps in, and because he has always used an end-entrance type of car with certain particular structural features, the newer type is passed by, and the reason, if you could pin the operating heads down to giving the real one, would often be found to be the alleged local conditions in that particular city.

TRANSPORTATION MAN.

Box-Frame Motors and the Removal of Armatures

EMPIRE UNITED RAILWAYS

SYRACUSE, N. Y., Oct. 2, 1915.

To the Editors:

In connection with the discussion of box-frame motor parts and armature removal, I would say that I have found very interesting both Mr. Potter's article in the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 28 and the discussion of Mr. Booth's article in the issue for Sept. 4. I have been using Mr. Potter's method since 1908 on motors weighing 3750 lb. and 4500 lb. complete, with absolute success. I see no reason for the installation of any elaborate devices for removing armatures from motors of this type, as, after observation of various methods in different shops, I came to the conclusion that the simpler method requiring only the service of a hoist is, as is usual with simple methods, the best and most economical.

I believe that the placing of the armature in the motor frame from above has one advantage over the horizontal method in that the workmen are able to see if the armature is bumping the pole pieces as it is lowered. A drop light may be placed in the commutator end of the motor and the man replacing the armature does not have to assume one of the poses of a Jess Willard exercise for the cure of indigestion, as he is able to observe the armature being lowered to its proper bearing while standing in a natural position. The only objection to the method described in Mr. Potter's article is that particles of foreign matter or dirt may drop into the commutator end bearing while the armature is being lowered. This objection is easily overcome by the use of a cardboard shield placed over the commutator end bearing until the armature shaft is low enough to just about enter the bearing.

In the writer's opinion one of the main advantages of the box-frame type motor is that it is necessary to remove the truck to change a motor on the heavier types. This places motor, truck and motor wiring within view, and parts which need replacement or repairs thus call loudly for attention by being brought to light.

While all subjects pertaining to the business are of considerable interest, it seems that a discussion of the removal of armatures from box-frame type motors is

really unnecessary, as the method to be employed is so obvious and simple and a discussion of the advantages of the box-frame motor over the split-frame type would seem a waste of breath and paper to anyone who has had experience with both types. I believe that a buyer of ordinary intelligence would no more purchase a split-frame motor to-day, unless for some special work, than he would purchase a GE-800 or a Westinghouse 12-A motor in place of those of the later-developed, efficient, ventilated, light-weight type.

H. C. PRATHER, Assistant General Manager.

Progress on the Newark Terminal

The \$5,000,000 terminal project of the Public Service Railway in Newark is rapidly assuming form. The steel framework of the building is in place and the erection of the walls is keeping pace with the floor work. It is expected that the entire building will be inclosed by Dec. 1 and that it will be entirely completed by May 1, 1916. Illustrated accounts of this important project were given in the issues of the *ELECTRIC RAILWAY JOURNAL* for Nov. 28, 1914, page 1190, April 24, 1915, page 793, and July 24, 1915, page 151.

New Passenger Station for Dayton, Covington & Piqua Railway

A new passenger station has recently been completed at Covington, Ohio, by the Dayton, Covington & Piqua Traction Company. The building is in accordance with the most modern ideas in interurban passenger station design, being constructed of brick throughout with a low-ridged roof and wide overhanging eaves. A concrete platform extends around all sides of the building. The interior is divided into rooms containing the offices, the baggage department, the lavatories and separate waiting rooms for ladies and gentlemen.

Thomas J. Brennan, general manager Dayton, Covington & Piqua Traction Company, has received a number of compliments on the new station as well as on a number of other improvements made by the company at Covington. At a recent meeting, in fact, the City Council of Covington, with the approval of the Mayor, adopted a resolution thanking the traction company for the addition of such an attractive structure as the new station to the numerous artistic buildings already in the city.

Detail Cost of Track Work with Steel Twin Ties

BY A. J. WOLFE, FORMERLY CHIEF ENGINEER SCIOTO VALLEY
TRACTION COMPANY, NOW WITH COLUMBUS RAIL-
WAY, POWER & LIGHT COMPANY

In the summer of 1911 the Scioto Valley Traction Company installed at Circleville, Ohio, under the writer's direction, about 9000 ft. of straight track of the type shown. The 7-in. T-rail was laid in a concrete beam foundation on International twin steel ties in a paved street through which the interurban cars were operated. Of course, the box truss construction and clip fastening of this tie are too well known to require description here.

The most interesting experience with the twin steel tie was acquired at the very beginning of its use. The track was laid during very hot weather, and the following winter was unusually severe. Yet even in zero weather the track was found to stay in perfect condition. In the following years the track continued its good behavior. Up to the time that the writer left the employ of the Scioto Valley Traction Company, September, 1913, not a cent had been spent to maintain this installation; nor has any money been spent upon it since.

For the benefit of other way engineers a detailed cost of this construction is given in the accompanying table. In considering the costs therein it should be noted that the joints were of especially substantial construction. The bonding, too, was unusually expensive, being prac-

tically double as heavy as that ordinarily used, due to municipal requirements based on electrolysis considerations.

As stated before the track had an unusual temperature test; in fact, it was exposed to freezing weather before the paving was laid. Even after this it was impossible to find the joints from the surface of the rail. The anchoring to the substructure due to the distribution of the stresses by the tie clips, and the protection of the joint bolts from shear contributed to this result. These bolts were put in with a driving fit.

I have been informed that there is difficulty now in finding these joints and that in five years of service not a single joint had given trouble. The only work required on the track has been on the paving, as the brick worked up on the outside of the rail due to the use of asphalt filler instead of cement grout. The special work in this construction was put in with Carnegie steel ties and solid concrete foundation and has required no work on it in the five years.

THE SCIOTO VALLEY TRACTION COMPANY—TRACK IN CIRCLEVILLE,
OHIO, BUILT WITH INTERNATIONAL TWIN STEEL TIES IN
GROUTED CONCRETE, SPRING, 1911

Items (9000 ft. straight track)	Total Cost	Cost per Lineal Foot
Engineering	\$509.23	\$0.0565
Special work and tie rods		
Rail	9,679.46	1.0755
Joints and fastenings	993.62	0.1104
Bonding	1,325.30	0.1472
Ties	3,963.48	0.4404
Laying new track	1,532.95	0.1700
Miscellaneous material	238.22	0.0265
Miscellaneous labor	482.64	0.0536
Gravel	611.20	0.0679

Handling trolley	351.96	0.0391
	\$38,816.47	\$4.3028

Total excepting special work.....\$38,816.47 \$4.3028

CONSTRUCTION DETAILS OF STEEL TWIN-TIE TRACK, CIRCLEVILLE, OHIO

Before entering his present position, the writer also installed for the Lancaster Traction & Power Company, Lancaster, Ohio, nearly 1 mile of twin-tie construction. This was similar to the Circleville work except that the joints were electrically welded both for the bonding effect and for mechanical strength, although the machine-fit bolts were retained. This work cost \$3.22 per lineal foot, including sand-filled brick paving.

Preventing Burning of the Top of Brushes

BY R. H. PARSONS, ELECTRICAL FOREMAN

Many otherwise perfectly good carbon brushes are thrown away because they are badly worn and chipped on top, although the commutator bearing surfaces are perfect and give promise of long service. Not only is the destruction of the carbon a serious trouble, but broken pieces of carbon falling upon the commutator become wedged under the brushes and, by injury to the commutator, do damage more costly to repair than the loss of the brushes.

In the older types of motors this difficulty was not so serious for many reasons, among which are the following:

1. The life of the brushes was not long enough to make the defects apparent.
2. The tension of the brush-holder springs was not as carefully attended to as now and was often excessive. While the result was a wearing of the spring and contact into the top of the brush, the brush itself wore out at the bottom before the top wear became troublesome.
3. There was not as much tendency for the spring in the old type motors to destroy the tops of the carbons as there is in many of the modern ones.

The accompanying diagrams show different types of spring contacts resting upon the carbons, drawn especially to show the relative width of contact space and brush space.

Fig. 1 shows the hammer found in a relatively old type of motor, hundreds of examples of which are in service to-day. The wearing of the top of the brush is

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

SEVERAL TYPES OF BRUSH-HOLDER HAMMERS, OLD AND NEW

not a distinctive trouble in this type provided that a proper spring tension and carbons of good quality are used.

Fig. 2 represents the contact in an early type of a more modern brush-holder. The tip is less than one-half the width of the carbon, and there has been no trouble experienced with this type of hammer in the destruction of the tops of the carbons.

Fig. 3 represents the type of contact used in all modern brush-holders, the one which causes trouble. The tip covers nearly the whole of the top of the car-

bon, and when it starts to wear into the brush the whole top is soon gone. It is then necessary either to throw away the carbon or to grind it down to a flat surface, wasting $\frac{1}{4}$ in. of length.

The remedy for the difficulty is illustrated in Fig. 4. It is to cut off the ends of the tip even with the spring, making the tips cover about one-third of the brush surface rather than nearly all of it. While it may be difficult to believe that this procedure will produce the results as stated, the reader is advised to try it if he is having trouble with worn and chipped brush ends. A brush-holder with the shorter tip will give three times the life of brush as the one with the long tip.

On first thought it might be said that, as the wear in the top of the brush is brought about by burning caused by the very small arcs formed between the tip and the

Fig. 5.

SKETCHES TO ILLUSTRATE ONE THEORY OF BRUSH-TOP BURNING

brush, the greater the surface covered by the tip the greater will be the carrying capacity of the contact. Therefore it would appear that with a wide contact there should be less liability of the formation of arcs by vibration and the jumping of the hammers as the trucks pass over rough tracks.

Although this argument sounds plausible it is not borne out by the facts. My conclusions, as stated above, are based on observations of a large number of motors. A certain company put in service 300 or 400 motors with brush-holder tips similar to those shown in Fig. 2. No trouble has ever been experienced with these brushes. Later another lot of 200 motors, and following that a lot of 400 motors, were put into service with brush-holders having wide contact tips. Inside of three months the brushes were found worn at the tops so badly that it was necessary to remove them and to grind off the worn parts. Part of these tips were of copper and part of bronze, and there were two or three different styles of surface contour among them, but no differences could be noted on account of the difference in shape or material.

The superintendent of equipment of the company concluded that, as the brushes were not being destroyed on the motors having the short contact tips it would be well to try a few of the new motors under the same conditions. The motor manufacturers gave their consent to this plan, although the ideas did not impress them strongly enough to influence them to change their designs. The result of the change was entirely satisfactory.

In endeavoring to arrive at an explanation of this result I have come to the conclusion illustrated in Fig. 5. It is that, as the commutator rotates and has lateral motion at the same time, force is exerted on the brush to tilt it. Although the brush is not completely lifted from the commutator it is slightly lifted. Under these conditions the long hammer is raised more than the short one and allows a greater arcing space at one end or the other. It is also raised from the brush end a greater length of time and therefore there is more opportunity and time for arcing. In the figure this condition has been greatly exaggerated in order to illus-

trate the theory clearly. Again, with the long hammer there is more leverage upon the hammer, tending to twist it. This produces greater wear on the brush-holder pin, allowing the hole in the hammer to become larger and this contributes to the wearing away of the top of the brush.

Whether the above is the correct explanation or not the fact remains that the short tip gives decidedly better service than the long one. Even if the burning and wear with the two types of tip were practically the same, the short tip would make only a small hole and would not destroy the entire top of the brush.

Remodeling Westinghouse No. 49 Motor Armatures

BY E. W. MCPHEETERS, ARMATURE WINDER UNITED RAILWAYS, ST. LOUIS, MO.

As there are many companies having Westinghouse No. 49 motors on hand, it may be of interest to describe a plan for remodeling the armatures. With slight changes and at small cost these can be made to give good service, as they are doing in four-motor equipments.

After the armature is stripped and tested for a sprung shaft, the laminations should be straightened, two core irons being run through the core so that the laminations will line up perfectly. The core slot should then be milled $3/32$ in. deeper. The slots should then be braced with hardwood sticks driven the length of the core. These should be about $1/2$ in. deep and forced in as tightly as possible to hold the laminations in place while grooves are being turned for the bands.

One groove should then be turned at each end and one in the center, $3/4$ in. wide by $3/32$ in. deep. The sticks should then be removed and the core should be filed up ready to be wound with three-turn coils, two coils being placed together. These coils should be wound from No. 9 magnet wire and they should be banded down with No. 17 steel-band wire, the surface of the band being somewhat lower than the surface of the core.

Comparative Tests of Chilled-Iron and Steel Wheels

In his presidential address delivered on Oct. 12 before the convention of the Association of Manufacturers of Chilled-Iron Wheels, George W. Lyndon suggested the following comparative tests for chilled-iron and steel wheels.

1. Relative wearing values when rotating on a steel rail under various loads, the tread wear and flange wear being observed separately.

2. Abrasion of the rail under various conditions of loading.

3. Determination of the intensity of heating stresses in all parts of the chilled-iron wheel—namely, single plate, intersection of plate, front plate, back plate, bracket, etc.

4. Analysis of the thermal test. Intensity of the stresses in various parts of the wheel and the effects of thickening the thermal ring, increasing and decreasing the temperature of the iron, etc. The thermal test should be an intelligent one instead of the present crude affair that is supposedly alike for all weights of wheels.

5. Determination of the stresses in the hub and the plates of the chilled-iron wheel due to pressing on axles. Variation in the stresses due to various classes of machining.

Improved Lighting for Westchester Cars

The lighting arrangement for the cars on the New York, Westchester & Boston Railway is being changed over at the present time to a system that includes a small number of large units located along the center line of the car instead of the numerous small lamps that were placed along the sides in the original arrangement. This gives an equal illumination with an expenditure of only 560 watts as opposed to the original power consumption of 966 watts and, in addition, has effected a number of improvements, including a very much better interior appearance.

Some time ago the railway company undertook some experiments for the purpose of selecting a lighting system that would be best adapted to the requirements of fifteen new cars that are being delivered for service on the line. The results obtained were so gratifying that it was decided to change the lighting arrangements on the old cars with which the road is equipped with the idea of providing better illumination, decreasing cost of lamp renewals, improving interior appearance and increasing value of advertising signs, in addition to decreasing lamp wattage by nearly 50 per cent.

Originally the lighting system installed in the cars

WESTCHESTER LIGHTING—NEW LIGHTING ARRANGEMENT WITH LARGE LAMPS AND REFLECTORS ALONG CENTER LINE OF CAR

consisted of forty-two 23-watt Mazda lamps located under the lower decks, twenty-one being placed on each side of the car. The lamps were mounted in flush sockets without reflectors. Ten emergency lights were located on the ceiling along the center line of the car, and these were operated through an automatic relay from a sixteen-cell 32-volt battery. In the new arrangement, however, the main lights are located along the center line of the car. Ten 56-watt Mazda lamps are used, these being fitted with Safety Car Heating & Lighting Company's fixtures and heavy-density opal glass reflectors. These reflectors, it may be said, are held in place by clips over which a collar screws down, and this provides an arrangement that gives perfect security against the shade working loose and falling to the car floor.

The emergency lights, under the new system, are located under the lower decks, five on each side of the car. The illustration shows lamp bulbs in each of the forty-two outlets along the lower deck although only ten emergency lamps are used, but the unused outlets are being covered with white enameled plates in the cars

that are now being equipped. On the fifteen new cars that are soon to be placed in service the emergency lights are to alternate with the main lights along the center line of the car, so that only one line of conduit with three circuits is required, whereas with the former system three lines of conduit and six circuits were used.

The change-over of the lighting system on the present cars was accomplished with practically negligible wiring alterations, the most important of which was a reversal of the leads to the jumpers at the ends of the car. The main lights are wired in two circuits, for which the old emergency-light cables along the center line of the car were used. These are of No. 14 wire and are large enough to carry the necessary power for the 56-watt lights. The old main circuits under the decks are used for the emergency lights in their new position.

The new lighting arrangement, together with the use of reflectors for the lamps, has accomplished a reduction in lamp wattage on the main lighting circuit from 966 to 560. This decreased wattage, however, has not reduced the effective illumination but has actually resulted in improved lighting conditions because the maximum of light is reflected from the ceiling to the plane of

WESTCHESTER LIGHTING—ORIGINAL ARRANGEMENT WITH SMALL LAMPS UNDER DECKS AT EACH SIDE AND EMERGENCY LIGHTS IN THE CENTER

the car seat where it is most useful. By using only 25 per cent of the original number of lamps, a large saving in lamp renewal cost is obtained.

Other noteworthy improvements incidental to the change are better appearance of the car interior and increased advertising value of the signs. If the latter were located along the curve of the ceiling at its junction with the car side, with the main lights located along the center of the car, a partial shadow would be cast across the face of the sign. To overcome this condition the signs were lowered to a position just above the windows, thus eliminating the shadow and bringing the signs down to a position where they are most conveniently seen. At the same time the additional white surface provided in the ceiling aids in reflecting and diffusing the lights thrown downward from the top of the car.

The interior appearance of the cars that are changed over is exceptionally pleasing. The lamp fixtures are of white enameled metal and these, together with the white opal glass reflectors, blend very well with the white ceiling of the car. Also the signal cord has been run along the top of the sign panel or frieze instead of

being supported by unsightly hangers along the center line of the car. This gives a clear opening under the ceiling and an exceptionally large white area. All of the changes were made by the railway company's forces.

A Balanced Trolley-Wire Splicer

Stability, light weight and reduced cost have been obtained by substituting an improved trolley-wire splicer for those formerly used by the overhead lines maintenance department of the Twin City Rapid Transit Company, Minneapolis, Minn. Increased stability was obtained, or the tendency of the splicer to overturn when in the line was overcome in the new splicer by minimizing the vertical depth which, as shown in the accompanying illustration, is only $\frac{7}{8}$ in. The length of the splicer was reduced to 10 in. by placing the openings

TWIN CITY TROLLEY-WIRE SPLICER

through which the wires pass side by side transversely with the long dimension of the splicer. This also permits the trolley wire to be twisted after it is passed through the splicer, thereby the strain is taken by the wires directly rather than through the clamping action of the splicer. A smooth under-running surface is obtained by lips that are bent in to fill the space formed by the bends in the wires where they enter the splicer. The reduction in vertical height as well as length decreased the weight of the splicer, and at the same time reduced the cost.

Durable Fiber

A new material, called Whalebone Fiber, has recently been placed on the market by the Diamond State Fiber Company, Bridgeport, Pa., this being an improvement on the ordinary type of vulcanized fiber which has been used in the past for track insulation. The process by which the new material is made gelatinizes cotton cellulose to such a degree that it becomes almost impervious to water, so that when it is immersed in water at a fixed temperature and for a given time it will not absorb nearly as much moisture as ordinary fiber under the same conditions. This in addition to the fact that the new material will stand pounding and rough usage, together with bad climatic conditions, makes it especially suitable for track work. A considerable amount of the new fiber has already been used for insulation at the joints separating track sections for automatic signal systems, and also for rail pads on bridges, for which use the material is manufactured in blocks $\frac{1}{2}$ in. thick.

The system of electric railways which is being constructed to connect Rome with surrounding localities is expected to be completed by the end of this year. The electric equipment is being supplied by the Italian Thomson-Houston Company.

Harps and Wheels of High Current-Carrying Capacity

The accompanying illustrations show two types of trolley wheels and harps now being put out by the Star Brass Works, Kalamazoo, Mich., which are designed especially for high speed lines and which have shown less

11 1/2-IN. DIAMETER TROLLEY WHEEL AND HARP FOR HIGH SPEED SERVICE

arcng and more mileage than the smaller wheels in the same service. On account of their large diameter there is more bearing surface on the wire and consequently greater contact and current carrying capacity. Wheel

10-IN. DIAMETER TROLLEY WHEEL AND HARP FOR HIGH SPEED SERVICE

No. 20, in the upper illustration, is 11 1/2 in. in diameter, 1 1/2 in. wide, has 3/4 in. depth of groove, and 2 in. length of hub. Wheel No. 21, shown in the lower illustration, is 10 in. in diameter, 1 7/8 in. wide and has 7/8 in. depth

of groove and 2 in. length of hub. Both wheels are furnished with graphite bushing for 5/8-in., 3/4-in. or 1-in. pin, as desired. The harps are of the regular "Kalamazoo" patented construction but are made large enough to take these wheels.

Street Railway Service Being Inaugurated in Miami, Fla., with Storage-Battery Cars

Miami, Fla., is soon to have its first street railway service, as the recently incorporated Miami Traction Company is now receiving from The J. G. Brill Company several small storage-battery cars. This city, one of the southernmost in the country, is below the frost line and is a center for the grape fruit industry. Partly on account of an increased appreciation of its fine climate and partly because it is located on the line of the Florida East Coast Railroad and at the mouth of

MIAMI CAR—GENERAL VIEW OF STORAGE-BATTERY CAR

one of the government canals leading from the Everglades, its population has increased rapidly in recent years. It is of interest, therefore, to note some of the features of the cars with which service is to be inaugurated in this thriving little city.

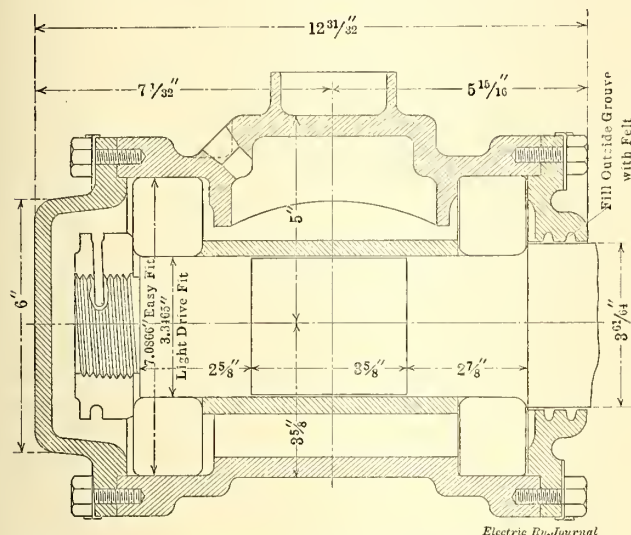

The bodies of the Miami cars are not unusual, being 18 ft. long over corner posts, 26 ft. 1 1/2 in. long over bumpers and 7 ft. 6 in. wide at the belt rail. They are fitted with longitudinal seats for twenty-four passengers. The wheelbase is 7 ft. 6 in., the wheels are of 30-in. diameter and there are two GE-1022 motors. The storage-battery equipment comprises fifty-eight MV-29 Hycap Exide cells. The weight of each car, completely equipped, is 10,696 lb. The general appearance of the

MIAMI CAR—PARTS OF BEARING AND HOUSING, OPERATION OF DRIVING BEARING HOME, HOUSING ASSEMBLED IN POSITION ON JOURNAL

car is shown in one of the accompanying illustrations on page 920.

The cars are equipped with S.K.F. ball bearings, for which a special housing and spring mounting was designed by the car company's engineers in consultation with those of the bearing company. The details of this housing are shown in the accompanying illustrations. The spring support of the body on the bearings is also

MIAMI CAR—CROSS-SECTION OF BEARING HOUSING

of interest as there are three long helical springs in each bearing with no semi-elliptical springs. The truck, therefore, is of the simplest possible construction, and the very considerable vertical play of the bearings in the pedestals provides the necessary cushioning effect to prevent jar on the battery. Obviously this construction also provides comfortable riding for the passengers.

Inexpensive Slack Take-Up for Brake Rigging

A convenient and inexpensive device for adjusting air-brake piston travel without necessity for going under the car has recently been brought out by the Johns-Manville Company, New York City. It is installed as a part of the brake-cylinder tie-rod at a point near the equalizing lever where it is most easy to reach, and it thus becomes an integral part of the foundation

VIEW OF UNDERSIDE WITH ALL SHIMS DROPPED INTO LOWEST POSITIONS AND TAKE-UP IN RETRACTED POSITION

brake rigging. Its installation eliminates the necessity for removing cotterpins, drawing out the brake pins and resetting the levers in the dead-lever guides to take up slack in the brakes. The underlying principle is the dropping of metal shims, each $\frac{1}{2}$ in. thick, behind the end of a plunger within a yoke, after moving the shims past the plunger end by rotating a pinion on a rack that is connected to the shim box. A turn of the pinion releases a shim which drops into the space that is thus left at the end of the plunger and this provides the equivalent of a $\frac{1}{2}$ -in. shortening of the tie rod, taking

up any wear that may have occurred at the brakeshoes. The shims are held in a yoke that travels within the exterior yoke to which the pinion is attached, and each shim has a hole in the lower half that the plunger may slide through when the shim is lifted and the take-up is extended.

The only labor necessary for the installation is the cutting off of the tie-rod and a rewelding, this being equivalent to the removal of a section of the rod corresponding to the space occupied by the take-up in its ex-

PLAN AND ELEVATION OF TAKE-UP IN RETRACTED POSITION AND SKETCH SHOWING METHOD OF APPLICATION

tended position. The take-up is furnished with a flat end to fit the jaw end of the cylinder tie-rod, and the other end is a jaw which fits over the equalizing lever. The total weight amounts only to approximately 35 lb., and the length in extended position is 28 in.

For its operation in case a supply of air for the brake application to test the piston travel is not obtainable, the take-up can be retracted until the brake-cylinder piston is forced against the head of brake cylinder, permitting a number of the shims to drop behind the end of the plunger. When the brakeshoes are pressing hard against the wheels a number of the fallen shims whose combined thickness corresponds to the amount of standard piston travel are lifted in the box or yoke that holds them. The pinion is then released and the plunger is forced inward by the recoil of the brake rigging, passing through the holes in the lifted shims and coming to a bearing against those shims that are not lifted.

This slack take-up is not an automatic brake adjuster,

TAKE-UP IN EXTENDED AND PARTLY-EXTENDED POSITIONS

and for this reason the device is stated by the makers not to conflict in any way with existing types of automatic apparatus designed for brake adjustment. It has, however, been manufactured primarily to accomplish the service now performed only by automatic adjusters, providing approximately equivalent results at a materially reduced expense. Therefore, it is especially suitable for equipment other than high-speed passenger cars where the question of first cost is not of primary importance. The device is listed at a price of \$6, thus making it available even for installation on freight cars.

News of Electric Railways

PORTLAND VALUATION BRIEF FILED

Company Places Value at \$62,000,000—Brief Contains 347 Printed Pages—Cost to Company for Preparation \$100,000

The Portland Railway, Light & Power Company, Portland, Ore., has filed its brief in the valuation case initiated by the Public Service Commission of Oregon. The company contends, that a fair and just valuation of its property lies somewhere between \$61,795,629 and \$62,134,542. The former figure is given as the value of the property as determined by its original cost plus subsequent increments. The latter figure is given as the value of the property as determined by the reproduction analysis, considering the going value of the concern. The brief was filed at the Portland office of the commission. It comprises 347 printed pages. The valuation of the company's properties involved a cost to the company of something like \$100,000.

Among other things the company contends that a just and equitable return upon the investments already made must be allowed by the commission if Oregon is to encourage the investment of other capital; that 8 per cent is the minimum rate of return which a public utility should be allowed to earn, not as a matter of abstract justice, but as a business proposition to be decided in view of the demands which the financial structure of the utility make; that utility investments are subjected to the hazards of unregulated competition and to the agitation of municipal ownership; that impairment of the credit of a utility is of more serious consequence than the temporary reduction of rates; that there has been no concerted nor sound demand for the reduction of the company's rates, and that the State should view the problem of regulation purely from a business standpoint.

In its general argument the brief says in part:

"Credit is the life-blood of the industry, and its impairment is of a more serious consequence to the utility than a temporary reduction of rates. Earnings are variable, but the rate base, as once determined, is likely to be permanent. This consideration of the direct result of the commission's finding upon the credit of the company is one of the most important considerations to be kept in mind in the decision of the case, when considered in conjunction with the fact that we are now passing through a time of depression, perhaps more acute in the Pacific Coast States than that of 1893; a time when almost every industry on the coast is subject to serious strains and when the earnings of this utility show a distressing decrease. The effect of the utility show a distressing decrease. The effect of the European war is a source of uncertainty sufficient to unsettle the financial world, and the ultimate effect of which cannot be foreseen. This depression, together with the presence of an unregulated jitney competition combined with the competition of a rival electric company serving only the short haul of the power business makes imperative a careful consideration by the commission of the fact that in the practical regulation of this investment in such times, a state must exercise care, because drastic or careless action will result in damage other than confiscation, and against which the courts provide no protection.

"In this relation there is a similar consideration, the importance of which is increased by the influence which the ultimate finding of fair value by the commission will have upon the securities and credit of the corporation. The utility is not earning and cannot earn under its present rate schedules and the present industrial depression a full 8 per cent upon the value of the property which it devotes to the public service. In this situation the utility will suffer irreparable injury if the commission in determining value and rates, in a circuitous manner, fixes the value of the property at such a point as will apparently justify the rate schedule determined.

"With the present acute depression, accentuated by unregulated and unfair competition, no sound policy of State dictates that the credit of this utility shall be impaired by a finding of a low rate base. This is particularly a fact,

when, in its railway lines, the earnings are such and the lengths of haul such that a reduction of rates is clearly impossible, and when in its electric light and power business the rates are clearly reasonable and kept so by free and active competition. This is particularly true, also, in view of what we regard as the most significant feature of this valuation proceeding; that, although the entire State knew of the investigation and all of the municipalities interested were notified, the rates of the company are such and the treatment of its customers such that, excepting in the unimportant and purely preliminary hearing, and excepting for the filing of a seventeen-page brief by the city, setting forth in a general way certain abstract principles of law, no municipality entered an appearance, and that out of the one-third of the population of the State served by the utility, the only person sufficiently interested in this proceeding to appear was one Charles P. Church.

"It cannot be said reasonably that there is a public demand for regulation of the company's rates. None of these appearances were made by persons or municipalities claiming an unreasonableness of rates or service. This is an investigation made by the commission upon its own motion, and properly so made, but in fairness to the utility it cannot be said that its rates are such as to demand, in the present economic situation, interference by public authority which in any way possibly can impair the credit of the enterprise.

"The eyes of the financial world are on the case, and this decision will be taken as a declaration of the policy of Oregon toward such investments. Investment capital is a commodity for which there is the same competition as for wheat and lumber. This competition exists between communities and states. Capital is cowardly. It follows the line of best return and least adversity. In the money market of this country the securities of this company must compete with the 4600 separate and distinct issues of investment bonds of a similar character from all other investment centers of the country."

NEW YORK BUS FRANCHISE OPPOSED

Interborough Rapid Transit Company, to Operate New City-Owned Lines, Surprised at City's Willingness to Compete with Itself

The Board of Estimate of New York City received on Oct. 22 the report of its franchise committee, recommending that the franchise for the new motor bus routes referred to in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23, page 882, should be awarded to the New York Motor Bus Company. The Interborough Rapid Transit Company, which is interested in the Fifth Avenue Coach Company, entered a protest. It raised the point that as in London and Paris the subway system had been seriously injured by the competition of the motor bus lines, it was extraordinary that the city which was just about to become a partner in the subway system in New York should set up a competitor to itself. J. L. Quackenbush, general attorney of the Interborough Rapid Transit Company, operating the subway and elevated lines in Manhattan and the Bronx, said that the bus matter had seemed so important to the company that it had dispatched two of its chief officials to London and Paris to investigate the experience there, and he thought that what they had ascertained should be considered by the city. Bainbridge Colby, who, with William R. Willcox, appeared for the New York Motor Bus Company, replied that it was for the city to decide the bus question according to the traffic needs of the population. A formal protest to the grant of the franchise to the rival concern was handed in by Richard W. Meade, president of the Fifth Avenue Coach Company, with a request for a rehearing. He contended that the franchise committee had ignored the advantages of one unified bus system throughout the city, and the coach company's offer to give the city one-half of the net profits. The board fixed Nov. 8 as the date for a public hearing on the general question of motor buses and Nov. 19 as the date for a public hearing on the specific application of the New York Motor Bus Company.

DEAN COOLEY'S DETROIT VALUATION FIGURES

\$56,184,165 Fixed as Reproduction Value, Including Franchises, of Property in One-Fare Zone

In his appraisal of the properties of the Detroit (Mich.) United Railway and its subsidiary companies, as of Jan. 1, 1915, Prof. M. E. Cooley, dean of the engineering department of the University of Michigan, fixes the reproduction value including franchises at \$56,184,165 and the depreciated value at \$50,815,063. The appraisal was made for the State Railroad Commission to establish a value upon which the company may be permitted to issue bonds. The appraisal specifically exempts from consideration the value of unified operation, terminal rights, operation on private right-of-way, entity of system, development charges, etc. In this connection Professor Cooley states: "These several items and others have not been considered in this appraisal for the reason and in the belief that the commission would itself wish to pass upon this." The property of the Sandwich, Windsor & Amherstburg Railway, located in Canada, was not included in the appraisal. Subdivided into corporate units, Professor Cooley fixes his values as follows:

	Reproduction	Depreciated
Detroit United Railway.....	\$34,072,511	\$30,263,925
Detroit, Jackson & Chicago Railway.....	3,846,060	3,336,869
Detroit, Monroe & Toledo Railway.....	3,792,218	3,431,997
Rapid Railway.....	5,107,038	4,502,446
Supplies, cash, etc.....	1,582,937	1,496,425
Total	\$48,400,764	\$43,031,662
Franchises	7,783,401	7,783,401
Grand total	\$56,184,165	\$50,815,063

The appraisal fixes the reproduction value of the physical property within the one-fare zone at \$26,563,435 and the depreciated value at \$23,609,765. Franchise values within this area are fixed at \$6,105,214, making a total valuation of the one-fare zone property of \$29,714,979. This is the property upon which the municipal ownership vote will be held in Detroit on Nov. 2. Since the appraisal was made the company has expended more than \$1,000,000 in track improvement within the one-fare zone.

The only comment made by the company in connection with the appraisal appears in its own weekly publication, in which it is stated that the Cooley appraisal justifies the statements of the company that it had a much greater investment than is represented by its stocks and bonds.

OBJECTIONS TO WASHINGTON POWER ORDER

The Public Utilities Commission of the District of Columbia continued on Oct. 25 its inquiry into the intercorporate relations of the Washington Railway & Electric Company and the Potomac Electric Power Company. The hearing was to determine why proposed orders of the commission mentioned briefly in the ELECTRIC RAILWAY JOURNAL of Sept. 18, page 602, should not be issued.

John S. Barbour, attorney for the companies, presented the brief of the companies. This reviewed at length the history of the Washington Railway & Electric Company and its subsidiaries and the developments leading up to the present business practice of both that company and the Potomac Electric Power Company.

Among other things the commission is seeking to require the companies to return to the conditions under which they operated under a contract entered into on June 23, 1906, and subsequently modified. The companies claim that the terms of this contract were altered by mutual consent for a valuable consideration and are no longer in force. Objecting to the requirement of the proposed order that would compel the Potomac Electric Power Company to reduce its rates to consumers to an amount to offset any increased amounts received by it from carrying out the commission's order, the company contended that there would be no increase in revenue if it complied with the order; that the present rates are not unjust or discriminatory; that the commission has not ascertained and determined proper and adequate rates of depreciation as provided in the public utilities law, and that the commission has not yet ascertained the value of the property of the power company in accordance with the public utilities act. The commission expects to hear oral arguments during the week ended Nov. 6.

PROPOSED CHICAGO ELEVATED WAGE SCALE

Negotiations between the elevated railroads of Chicago and an employees' committee which were begun on Oct. 9 have resulted in a proposed contract, the terms of which it was intended to submit to the vote of the employees on Oct. 29. No essential changes were made in the working conditions, but substantial increases in pay were granted to all classes of employees. The graduated scale for regular motormen was wiped out. This required one year at 30½ cents before the maximum of 34 cents was allowed. Regular motormen, under the new contract, will receive 36 cents an hour, which amount will be increased to 38 cents an hour beginning with the second year of the contract. The previously existing minimum for extra motormen was increased from 28 cents to 32 cents an hour, and the maximum which obtained after two years' service was increased from 29½ cents to 34 cents an hour. The existing hourly wage of conductors was increased from 27 cents to 29 cents an hour for the present year, and for the year commencing June 1, 1916, this amount will be further increased to 31 cents an hour. The present minimum for conductors which obtained before the first year of service was 25½ cents. The wages of regular guards, it was decided, should be increased from 24 cents to 26 cents an hour for the present year, and commencing June 1, 1916, this will be further increased to 28 cents an hour. The minimum for extra guards was increased from 21 cents to 23 cents an hour, and the maximum which obtains after three years of service was increased from 24 cents to 26 cents an hour. Wages of switchmen, switch tenders, towermen and bridgemen were generally increased about 2 cents an hour, and the wages of flagmen, ticket agents, shop and roadway employees were also substantially increased.

SENATOR BORAH ON POST-BELLUM ISSUES

He Sees Government Ownership of Public Utilities as the Next Great Political Issue

United States Senator William E. Borah, regarded as one of the ablest Senators in the upper House and an avowed candidate for the Republican Presidential nomination, discussed in an interview in the New York *Sun* of Oct. 25 the post-bellum issues which he regards as likely to be raised. He believes that the message "Prepare for Peace," is the one that should be conveyed with emphasis equal to the movement in favor of military preparedness. The Senator from Idaho predicts that the Republican party in the next national convention will write the most advanced and liberal platform that it has adopted since 1860. He regards the recent action taken by the party in conservative Massachusetts as indicating what may be expected from the next national convention.

In discussing the great national issues Senator Borah is reported to have said:

"In the language of a brilliant editor in the West: 'There has arisen a new conscience in relation to things both governmental and social; new ideas and new standards possess the mind and stand fixed in universal judgment.' The views of the Republicans of the old commonwealth of Massachusetts, as evidenced by the broad and liberal platform adopted, indicate what we may fairly expect at the next national convention. The progressive movement in this country is just as forceful as ever and will not be content with anything on the hitherside of a pronounced declaration of liberal policies. We have moved on and we do not propose to return to the practices and precepts which sprang up under a long lease of power and by reason of the arrogance of continued success.

"The next great political issue in this country is going to be that involving government ownership of public utilities. Regulation in the minds of many people has broken down. It is not satisfactory to the public nor to the owner of the property. Efficiency in this war has come from those most highly and pronouncedly given over to state socialism, and even France and England have made tremendous strides in that direction out of sheer necessity. The question will be asked, If it gives efficiency in war why shall we doubt that it will give efficiency in peace? And we will have the question of public ownership up for consideration."

WILKES-BARRE STRIKE

The striking employees of the Wilkes-Barre (Pa.) Railway have ten days in which to return to work. This was made known by the company officials and in the meantime T. A. Wright, the general manager, declared that no attempt will be made to operate cars.

The sliding scale fixed by the arbitrators in their original award will be paid. The company desires to operate its lines with the men who have been in its employ and no effort has been made to secure men to take the places of the strikers. After announcing its policy, company officials settled down to a condition of watchful waiting.

A notice was posted at the offices of the company to the effect that all men turning in company property such as punches, whistles, etc., for which the men made a deposit with the company upon entering its employ, would receive all money due them. Union officials, learning of this, at once set to work, and in a few hours had sent nearly every union man to the company's office to turn in his property.

A late development of the strike situation is the agreement by Mr. Wright to meet the members of the executive board of the union, provided that they have something new to offer. National board members of the union have left Wilkes-Barre to confer with the president of the international at Detroit and it is probable that nothing will be done until after return.

The latest development in the strike situation has been supplied by the officials of the union in the statement given out as a result of the conference with International President W. D. Mahon, at Detroit, that "we can see no other course than to stick to our present demands and fight it out, unless we get what we believe is due us."

This stand of the union leaders, coupled with the determination of the company officials not to recede from the position they assumed after the strike was called, gives little hope for a peaceful settlement of the strike, particularly as the company is continuing preparations to resume the operation of cars on Nov. 1.

The union has turned a deaf ear to the proposition to refer to the local courts the question of right of the arbitrators to repudiate their award.

FORT WAYNE STRIKE INJUNCTION CASE ACTION

A request for a temporary injunction against Mayor Hosey and other city officials of Fort Wayne, Ind., Joseph C. Colgan, executive officer of the Amalgamated Association, and officers and members of various labor unions has been filed in the federal court at Indianapolis by the United States Mortgage & Trust Company in behalf of the bondholders of the Fort Wayne & Northern Indiana Traction Company. The filing of this suit followed the withdrawal of the former suit for an injunction against Colgan and other Amalgamated Association officials and members for attempting to bring about a strike in Fort Wayne, a permanent restraining order being now unnecessary on account of the company being able to operate all its cars on full schedule with new men. Mayor Hosey and officers of the municipal lighting plant at Fort Wayne are brought into the new suit for an injunction. They are charged with attempting to cripple the electric lighting business of the traction company by trying to induce patrons of the company's lighting plant to violate their contracts and make new contracts with the municipal plant. The bill of complaint asks that other defendants be enjoined from using intimidation, threats and displaying posters and placards to prevent persons from riding on the street cars and also to prevent labor unions from printing notices in newspapers threatening to impose fines on members who ride on the cars. The application for the new restraining order will be argued by attorneys for the plaintiff on Nov. 8.

New Haven Suit Progress.—The testimony introduced by the government in its suit in the Federal District Court in New York against directors of the New York, New Haven & Hartford Railroad has so far all been concerned with the early history of the company and with its operations in the maritime field and with other steam railroads. C. S. Mellen, former president of the company, has been the principal witness.

Holyoke Arbitration Postponed.—Following a recent inspection trip over the property of the Holyoke (Mass.) Street Railway, the arbitration board sitting in the wages dispute between the company and the local branch of the Amalgamated association adjourned sessions until Nov. 3. Efforts are being made to limit the presentation of testimony to three days for each side, with a seventh day for arguments.

Inquiry Into New York Elevated Contracts.—The Thompson legislative committee, which is inquiring at this time into the rapid transit contracts made in New York City, interrogated J. P. Morgan on Oct. 27. The inquiry had to do particularly with the elevated third-tracking awards of the Interborough Rapid Transit Company let originally on the basis of cost plus 15 per cent and subsequently relet to the extent of about 80 per cent on the basis of cost plus 5 per cent.

Chicago Electrification Report to Be Released on Nov. 23.—Nov. 23 has been definitely fixed by the Chicago Chamber of Commerce as the date when the smoke abatement and terminal electrification committee will submit its report to the city. On that day a dinner will be tendered to Mayor Thompson, his cabinet and the members of the City Council. Much importance is attached to the electrification report because of the exhaustive study the engineers have made of the subjects of smoke pollution and terminal electrification.

Salt Lake-Idaho Interurban Opens.—The first through train between Salt Lake and Preston, Idaho, over the interurban lines of the Ogden, Logan & Idaho Railway left Salt Lake on Oct. 14. Simultaneously with the departure of the train a new time-table went into effect, placing in service sixteen trains daily between Salt Lake and Preston and two between Salt Lake and Brigham City. All the north-bound trains are scheduled to make the trip from Salt Lake to Preston in five hours. The south-bound trains cover the distance in four hours and fifty minutes.

Springfield Trolley Pole Removals.—Negotiations are proceeding favorably at Springfield, Mass., between the Springfield Street Railway and the property owners on Main Street for the removal of trolley poles between State Street and the Union Station. Through the efforts of the city planning commission several banks and merchants have agreed to the plan, which contemplates the installation of span suspensions attached to buildings in the zone where the poles now stand. About fifty poles are to be removed and about forty owners are expected to send signed agreements to the commission in the near future.

Cleveland's Municipal Ownership Vote.—In Cleveland, Ohio, the City Council recently turned down an ordinance to hold a special election on Nov. 2 to vote on the city taking over the lines of the Cleveland Railway for approximately \$34,700,000, but the Socialists secured enough signatures to petitions to put the proposition on the ballot at the election. Under the law Cleveland could not issue \$34,700,000 of bonds in any event as a general obligation of the city, as its limit for additional bonds, even by vote of its people is now about \$17,000,000. Under the franchise the city has the right to take over the property on six months' notice under an agreed valuation. There is practically no campaign for the passage of this ordinance.

Oakland Grievance Withdrawn.—In the ELECTRIC RAILWAY JOURNAL of Oct. 23, page 884, brief mention was made of the refusal by the San Francisco-Oakland Terminal Railways, Oakland, Cal., to submit to arbitration representation made in behalf of the employees with respect to working conditions. At 2.30 a. m., on Oct. 10, at a mass meeting of Division 192 of the carmen's union, the Key Division grievance committee presented its report to the division with recommendation that the grievances regarding the reinstatement of the two deckhands and request for arbitration as to interpretation of the contract with the company be withdrawn. This report and recommendation were adopted almost unanimously by members of the division.

Seattle Paving Case Before Corporation Counsel.—The refusal of the Puget Sound Traction, Light & Power Company, Seattle, Wash., to comply with the order of the Board of Public Works to pave its right-of-way in certain streets now being paved by the city has been referred to Corpora-

tion Counsel Bradford for such action as may be necessary to force compliance with alleged provisions of the company's franchises, which also require the payment to the city of 2 per cent of the company's gross earnings. The company points out that it has applied to the State Public Service Commission for an order relieving it of certain of its franchise obligations, including the paving of its right-of-way, and that until some disposition is made of the petition, it desires to make temporary improvements by planking that portion of various streets occupied by track. As heretofore reported, the company has offered to advance to the Public Service Commission the sum of \$10,000 in order that the valuation of the company's property in Seattle may be determined. This valuation is regarded as necessary before the commission can act upon the application.

Committee on Removal of Brooklyn Elevated Reports.—The committee of five, appointed early this year by the Brooklyn committee of one hundred, to investigate and report upon the possibilities of assessing land values within Brooklyn for the purpose of removing the elevated tracks of the Brooklyn (N. Y.) Rapid Transit Company from Fulton Street and relocating the line in a subway on Livingston Street, has issued a preliminary report. The committee has also presented extensive maps and other details, which are to be first submitted to the property owners within the proposed area of assessment and then reported back to the committee of one hundred. The plan of the committee to relocate the Fulton Street elevated lines in a subway on Livingston Street is intended to prevent the rebuilding and reconstruction of the elevated structure along Fulton Street. The committee in its findings says that the proposed subway beginning at Cumberland Street to Lafayette Avenue to Livingston Street to Clinton Street and the Brooklyn Bridge, with a connection at Ashland Place at Fulton Street with the new subway now being constructed, would cost about \$5,500,000, and this could be met in whole or in part by levying an assessment in ten annual installments upon land values in the specified areas set forth.

PROGRAMS OF ASSOCIATION MEETINGS

Public Utilities Association of West Virginia.

The Public Utilities Association of West Virginia will meet at White Sulphur Springs, W. Va., on Nov. 18 and 19.

Railway Development Association

The Railway Development Association will hold its annual convention at the Hotel McAlpin on Nov. 9-11. The afternoon of Nov. 10 will be occupied by a boat trip around New York Harbor and in the evening the annual banquet will take place at the McAlpin. S. C. Mead, secretary of the Merchants' Association of New York, will act as toastmaster at the banquet. The speakers will be Howard Elliott, president of the New York, New Haven & Hartford Railroad, J. W. Weeks, United States Senator from Massachusetts, and Ralph Peters, president of the Long Island Railroad.

Philadelphia Valuation Conference

The program has been announced for the conference on the principles and methods of valuing public utilities, to be held under the auspices of the Utilities Bureau at the Hotel Adelphia, Philadelphia, Pa., on Nov. 10, 11 and 12. The arrangement of the sessions provides for the consideration of the subject "The Reproduction Theory" on Wednesday, Nov. 10, the consideration of the subjects "Original Cost," "Franchise Values" and "Valuing Land" on Thursday, Nov. 11, and the consideration of the subjects "Depreciation," "Going Value" and "Valuation and the Future in Public Utilities" on Friday, Nov. 12.

The session of Nov. 10 will be opened at 8 o'clock in the evening. The presiding officer will be Rudolph Blankenburg, Mayor of Philadelphia. The opening remarks will be made by Morris Llewellyn Cooke, director of public works of Philadelphia and acting director of the Utilities Bureau. The subjects and the speakers at this session follow:

"Criticism of Reproduction Theory of Valuation," by John H. Eshleman, Lieutenant-Governor of California and former president of the California Railroad Commission.

"Reproduction Values vs. Fair Value," by H. Findlay French, attorney-at-law, Baltimore, Md.

The discussion of these subjects will be opened by Prof. Morris Knowles, consulting engineer, Pittsburgh, Pa., director of the course in valuation of public utilities at the University of Pittsburgh.

The second session will be opened at 10 a. m. on Nov. 11. The presiding officer will be C. W. Kutz, chairman of the Public Utilities Commission of the District of Columbia. The subjects and the speakers at this session follow:

"Actual Cost as a Basis for Fair Value," by George W. Anderson, attorney-at-law, Boston, Mass.

"Original Cost as the Chief Basis for Fair Value," by Prof. Edward W. Bemis, Board of Supervising Engineers, Chicago, and member of the advisory board to the division of valuation of the Interstate Commerce Commission.

"The Making and Maintenance of Priced Inventories," by Charles L. Pillsbury, chief engineer, Valuation Bureau of the Public Utilities Commission of the District of Columbia.

The discussion of the first two of these subjects will be opened by Dr. Robert H. Whitten, secretary to the Board of Estimate committee on the city plan, New York; Henry E. Elrod, engineer, Dallas, Tex., and Edward P. Burch, consulting engineer, Detroit, Mich. The discussion of the paper by Mr. Pillsbury will be opened by James W. Phillips, grade crossing division, Bureau of Survey, Philadelphia; F. W. Ballard, commissioner and chief engineer, division of light and heat, City of Cleveland, Ohio, and R. J. Meigs, Western Union Telegraph Company, New York, N. Y.

The third session will be opened at 2.15 p. m. on Nov. 11. The presiding officer will be Dr. L. S. Rowe, president of the American Academy of Political and Social Science. The subjects and the speakers at this session follow:

"Valuation by Approximation," by John G. Morse, appraiser, Associated Factory Mutual Fire Insurance Companies, Boston, Mass.

"Franchise Values," by Dr. Delos F. Wilcox, consulting franchise and public utility expert, New York City, and Deputy Commissioner, Department of Water Supply, Gas & Electricity, New York.

The discussion of "Valuation by Approximation" will be opened by Morris Llewellyn Cooke, director of Public Works of Philadelphia, and John R. Freeman, president of the Manufacturers Mutual Fire Insurance Company, Providence, R. I. The discussion of "Franchise Values" will be opened by Henry De Forest, president and counsel, Queens County Water Company, New York; Chester A. McLain, lecturer, Harvard University, and Alfred Bettman, attorney-at-law, Cincinnati, Ohio.

The fourth session will be opened at 8.15 p. m. on Nov. 11. The subject and the speaker follow:

"Principles to Be Applied to Valuing Land," by Hammond V. Hayes, consulting engineer, Boston, Mass.

The discussion will be opened by Edward W. Doty, of the Columbus Railway, Power & Light Company, and Milo Roy Maltbie, of the advisory board of the division of valuation of the Interstate Commerce Commission.

The fifth session will be opened at 10 a. m. on Nov. 12. The subjects and the speakers follow:

"Court Decisions on Depreciation," by J. H. Goetz, of counsel for the Public Service Commission for the First District of New York.

"Depreciation as a Factor in Fair Value," by Halford Erickson, of the Wisconsin Railroad Commission.

Among those who will open the discussion are Philip J. Kealy, of the board of control of the Kansas City Railways.

The sixth session will be opened at 2.15 on Nov. 12. The subject and the speaker follow:

"Going Value as an Element in Fair Value," by Clifford Thorne, chairman of the Iowa Board of Railroad Commissioners.

Among those who will participate in the discussion are Ray Palmer, Chicago, and William J. Hagenah, Chicago.

A dinner will be held on Friday evening at 6.30 o'clock. The presiding officer will be Dr. Charles R. Van Hise, president of the University of Wisconsin. Addresses will be made by Charles A. Prouty on "The Meaning of the Constitutional Protection in Valuation," by William D. Kerr on "Constitutional Protection in Valuation," by Prof. John H. Gray on "Opinion Testimony," and by Mr. Maltbie on "Valuation and the Future in Public Utilities." All the meeting will be open to the public.

Financial and Corporate

ANNUAL REPORTS

Aurora, Elgin & Chicago Railroad

The statement of income, profit and loss of the Aurora, Elgin & Chicago Railroad, Wheaton, Ill., for the year ended June 30, 1915, follows:

Gross earnings and other income:	
Revenue from transportation.....	\$1,632,083
Revenue from operations other than transportation...	336,285
Interest	278
Miscellaneous	581
Total gross earnings and other income.....	\$1,969,227
Operating expenses and taxes:	
Maintenance of way and structures.....	\$194,590
Maintenance of equipment.....	132,555
Power	235,933
Traffic	20,896
Conducting transportation.....	411,506
Other operations.....	31,270
General and miscellaneous.....	295,596
Total	\$1,322,346
Less undistributed operating credits.....	4,955
Remainder	\$1,317,391
Taxes	41,956
Total operating expenses and taxes.....	\$1,359,347
Gross income	\$609,880
Deductions from income.....	443,437
Net income.....	\$166,443
Profit and loss surplus at beginning of year.....	557,718
Adjustment of liability on interchangeable coupons..	17,450
Balance in reserve for replacements and renewals, June 30, 1914.....	24,063
Profit and loss—gross surplus.....	\$765,676
Dividends on preferred stock.....	186,000
Discount applicable to prior period.....	591
Profit and loss—surplus at end of year.....	\$579,085

The annual report states that the results of the year's operations were very disappointing to the officers. For the first time in the history of the company its gross income suffered a material decrease. In the absence of jitney or other unusual competition and conditions, the officers have concluded that the loss was caused by the prevailing industrial conditions obtaining in and around Chicago, by the unusually backward summer and by the fact that Saturdays, Sundays and holidays during the last months were almost invariably rainy days. In regard to the first point, a recent detailed analysis of conditions prevailing in the Fox River Valley made by the traffic department indicated a decrease in hours of employment approximating 30 per cent.

Although no comparative figures are published in the report for the last fiscal year, a comparison of this report with that for the preceding year, analyzed in the *ELECTRIC RAILWAY JOURNAL* of Dec. 19, 1914, shows that the revenue from transportation in the year just ended was \$1,632,083 as compared to \$1,726,724 for the year previous, a decrease of \$94,641 or 5.4 per cent. The total gross earnings and other income dropped from \$2,096,183 to \$1,969,227, a decrease of \$126,956 or 6.0 per cent. The total operating expenses and taxes decreased from \$1,396,791 to \$1,359,347, an amount of \$37,444 or 2.7 per cent.

In thus comparing the two years it should be noted that the company, following the ruling of the Interstate Commerce Commission effective on July 1, 1914, charged during the last year to operating expenses and against income respectively, and credited to reserves: For depreciation of equipment, \$31,493, and for amortization of discount on bonds, \$10,287. It should also be noted that the inclusion of the new operating expense account "power" for the last year renders a comparison of the various operating expense divisions for the two years useless without an extended analysis of the previous accounting for all power items.

The taxes for the last year decreased \$11,984 or 22.2 per cent, and the gross income decreased \$89,512 or 12.8 per cent. Deductions from income, however, showed an increase of \$24,678 or 5.9 per cent, and the net income decreased \$114,190 or 40.7 per cent. Owing largely to certain profit and loss credits, however, as indicated in the forego-

ing statement, with also a decrease of \$93,000 in the debit for dividends, the surplus at the end of the year showed an increase of \$21,366.

New South Wales Government Railways & Tramways

The report of the chief commissioner of the New South Wales (Australia) Government Railways & Tramways for the year ended June 30, 1915, shows the following comparative results:

	Tramways		Railways	
	1915	1914	1915	1914
Earnings	£1,986,060	£1,934,164	£7,616,511	£7,742,241
Working expenses	1,611,286	1,669,033	5,311,162	5,409,820
Balance	£374,774	£265,131	£2,305,349	£2,332,421
Interest	284,639	263,451	2,328,680	2,123,054
Surplus	£90,135	£1,680	*£23,331	£209,367

*Deficit.

From the above it will be observed that the railway earnings decreased £125,730 or 1.62 per cent during the last fiscal year, on account of war conditions, while the surplus of £209,367 in 1914 fell off by £232,698 to a deficit of £23,331 in 1915 on account of a smaller decrease in working expenses and an increase in interest. On the other hand, the tramway earnings made a much better showing in the last year than in the one preceding. The earnings increased £51,896 or 2.68 per cent, and the working expenses decreased £57,747 or 3.4 per cent. The net result, after providing for a small increase in interest, was a surplus of £90,135 as compared to the preceding year's surplus of £1,680, an increase of £88,455. This tramway surplus would have been turned into a deficit, however, and the railway deficit would have been greatly increased, had it not been for the increased fares granted late in the preceding year, which added £148,666 to the railway and £155,000 to the tramway earnings during the last year. Without these increases the railways would have shown a decrease in surplus of 0.58 per cent on capital account instead of a decrease of 0.35 per cent, while the tramways would have suffered a decrease of 0.83 per cent on capital account instead of an increase of 1.1 per cent.

During the last year 217 officers and 1805 men joined the expeditionary forces at the front. The list of casualties covered 185 at the end the year. The permanent employees at the front are paid the difference between their wages as employees and the military allowance, which involves a cost of about £46,000 per annum. Furthermore, the positions of the men are to be kept open for them.

SECTION OF ROCK ISLAND LEASED

The receivers of the Rock Island Railroad have ended negotiations for leasing to the newly organized Muscatine & Iowa City Railway, Muscatine, Iowa, 104 miles of the Rock Island lines between Muscatine and Montezuma with branches to Iowa City and What Cheer, Iowa. The new company will substitute gasoline-electric motive power for steam power, and will furnish both a passenger and a freight service to twenty-two cities and villages. Arrangements have been made with the Iowa Railway & Light Company, Cedar Rapids, Iowa, whereby a portion of its line will be used for entrance into the business district of Iowa City. The new organization was formed by business men of Muscatine, Iowa City, Wellman and Montezuma. A. D. Bowen, Muscatine, has been elected president.

Boston (Mass.) Elevated Railway.—Authority to issue \$3,286,000 of additional bonds is asked by the Boston Elevated Railway in a petition filed with the Massachusetts Public Service Commission. The bonds are to provide for construction and equipment, floating debt and property.

Boston & Maine Railroad, Boston, Mass.—The annual report of the Boston & Maine Railroad for the year ended June 30, 1915, covers the operations of the two owned electric railway branches, the Portsmouth (N. H.) Electric Railway and the Concord & Manchester (N. H.) Electric Branch, and the one leased line, the Conway (Mass.) Electric Street Railway. The combined operating revenues of these first two lines for the last fiscal year were \$250,889, a decrease of \$14,930 as compared to \$265,819 in the pre-

ceding year. The total operating expenses increased from \$177,685 to \$185,575, an amount of \$7,890, so that the net revenue decreased by \$22,820 from \$88,133 to \$65,313. The number of passengers carried decreased from 5,204,740 to 4,916,019, or 288,721, and the number of car miles run from 1,134,386 to 1,090,202, or 44,184. The operating revenue of the Conway Electric Street Railway decreased slightly from \$11,346 in 1914 to \$11,107 in 1915, but the operating expenses increased from \$9,786 to \$16,006, resulting in a deficit of \$4,899 in net revenue for 1915, as compared to a plus item of \$1,560 for 1914.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—Judge Landis in the United States District Court recently entered an order authorizing W. O. Johnson, receiver Chicago & Milwaukee Electric Railroad, to issue receiver's certificates for the construction of a bridge to cost \$40,000. The certificates are to bear interest at the rate of $5\frac{1}{2}$ per cent.

Choctaw Railway & Lighting Company, McAlester, Okla.—L. E. Fischer and Allen Wright have been appointed receivers of the Choctaw Railway & Lighting Company. This act is the result of a suit filed by the Guaranty Trust Company, New York, to foreclose on a mortgage covering \$894,000 of outstanding bonds, mentioned in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9.

Columbia Railway, Gas & Electric Securities Company, Columbia, S. C.—Redmond & Company, New York, are offering at $99\frac{1}{2}$ and interest convertible 6 per cent secured gold coupon notes, series B, of the Columbia Railway, Gas & Electric Securities Company. These notes are dated April 1, 1915, and are due on Oct. 1, 1917. They are convertible at the option of the holder, on any interest date at ten days' notice, into an equal par value of deposited first mortgage bonds and \$120 in cash per note, making the net cost of the bond 88 (a $5\frac{3}{4}$ per cent basis). The notes are secured by the deposit of first mortgage 5 per cent bonds of the Parr Shoals Power Company, guaranteed principal, interest and sinking fund by the Columbia Railway, Gas & Electric Company, each \$1,000 note being secured by \$1,350 par value of bonds. The Columbia Railway, Gas & Electric Securities Company is a subsidiary of this guarantor company, organized for the purpose of selling securities.

Humboldt Transit Company, Eureka, Cal.—The California Railroad Commission on Oct. 4 issued an order authorizing the Humboldt Transit Company to issue to William Butterworth a one-year promissory note for \$4,000 at 5 per cent and to pledge as collateral security therefor \$8,000 of first mortgage 5 per cent sinking-fund thirty-year gold bonds.

Long Island Railroad, New York, N. Y.—Because the operating companies (the Interborough Rapid Transit Company and the New York Municipal Railway Corporation) have challenged the right of the Public Service Commission for the First District of New York under the dual system contracts to compel them to operate leased private roads, the commission has asked its counsel to give an opinion relative to the proposition of the Long Island Railroad to lease to the city its Whitestone and Little Neck branches. These lines were to be operated by the two companies as extensions of the Corona elevated line. The commission has also requested the Board of Estimate and Apportionment to take up this matter, to the end that the corporation counsel's opinion can also be obtained. The Long Island Railroad on Sept. 30 offered to rent these branches to the city at \$125,000 per annum, plus certain additional charges, for a term of ten years, with the privilege of a ten-year renewal. Previous reference to this matter was made in the *ELECTRIC RAILWAY JOURNAL* of April 17, May 15 and Oct. 16.

Los Angeles & San Diego Beach Railway, San Diego, Cal.—The Los Angeles & San Diego Beach Railway has received permission from the California Railroad Commission to sell bonds of the par value of \$370,000 before Nov. 15, 1916. The company received authority on Nov. 25, 1914, to issue \$375,000 of bonds, but it has sold only \$5,000 of them.

Memphis (Tenn.) Street Railway.—Transcripts of the records of two big damage suits from the United States

District Court at Memphis were filed by the Memphis Street Railway in the United States Circuit Court of Appeals at Cincinnati on Oct. 11. S. C. Moore and E. O. McCoy had brought suits against this company for damages because of injuries received when a street car collided with a train on the Illinois Central Railroad. The jury awarded them \$25,000 and \$20,000 respectively. Motions for new trials were filed, but the court issued an order overruling them, provided the plaintiffs would accept remittiturs to \$17,500 and \$12,500 respectively, which they did. The company then appealed on error from the judgment of the United States District Court.

Metropolitan Street Railway, Kansas City, Mo.—The receivers of the Metropolitan Street Railway filed in the Federal Court at Kansas City on Oct. 26 a statement including the report of the managers of the reorganization plan, showing that about 98 per cent of the securities holders had agreed to Judge Hook's plan. It is expected that Judge Hook will formally take up within a few days the disposal of the receivership, and the inception of the ownership of the property by the Kansas City Railways, the company provided for in the new franchise. The report of the committee was signed by Kuhn, Loeb & Company, Lee, Higginson & Company and Blair & Company, and by H. L. Stuart representing Judge Hook.

Monongahela Valley Traction Company, Fairmont, W. Va.—The Monongahela Valley Traction Company has declared a quarterly dividend of $1\frac{1}{4}$ per cent on its preferred stock, payable on Nov. 2 to stock of record on Oct. 27. In the past the company has paid semi-annual dividends of $2\frac{1}{2}$ per cent, but from this time on dividends will be declared quarterly at the regular 5 per cent rate.

New York (N. Y.) Municipal Railway Corporation.—The Public Service Commission for the First District of New York has granted permission to the New York Municipal Railway Corporation to issue \$20,000,000 of 5 per cent sinking-fund gold bonds under its \$100,000,000 mortgage to the Central Trust Company dated July 1, 1912. The application for this issue was noted in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23. The bonds will be sold at not less than 97, and will mature on Jan. 1, 1966. They are to be redeemable at $107\frac{1}{2}$ on any semi-annual interest date, and are to be amortized before maturity by the sinking fund provided for in the terms of the mortgage. All the bonds must be sold before Jan. 1, 1916.

Pacific Gas & Electric Company, San Francisco, Cal.—The California Railroad Commission has issued an order authorizing the Pacific Gas & Electric Company to acquire, and the trustees in liquidation of the West Sacramento Electric Company to transfer all the property formerly owned by the latter company. The application for this sale was made by the trustees of the West Sacramento Electric Company, who stated that the Pacific Gas & Electric Company had already acquired and paid for all the capital stock. The authorization for the stock purchase was noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 14. The Pacific Gas & Electric Company already owns and operates the electric railway lines in the territory served by the purchased company.

Philadelphia Company, Pittsburgh, Pa.—Charles Hayden has been elected a director of the Philadelphia Company and the Duquesne Light Company.

Public Service Corporation of New Jersey, Newark, N. J.—A gain of more than 5 per cent in gross business for September, 1915, over the corresponding month of last year is shown in the financial statement just issued by the Public Service Corporation of New Jersey. The gross figures cover the corporation's railway, gas and electric business. To be exact, the gross increase in total business for last September was \$162,430, a percentage of increase of 5.3 per cent over September, 1914. The balance available—after payment of operating expenses, fixed charges, sinking fund requirement, etc.—for amortization, dividends and surplus, was \$411,444, and the increase in surplus available for dividends was \$48,819. For the nine months ended Sept. 30, 1915, the gross increase in total business was \$968,712, a percentage of increase of 3.7 per cent. The balance available for amortization, dividends and surplus was \$2,506,391,

and the increase in surplus available for dividends was \$194,202.

Quebec Railway, Light, Heat & Power Company, Quebec, Que.—The gross earnings from operation of the Quebec Railway, Light, Heat & Power Company for the year ended June 30, 1915, were \$1,548,096 as compared with \$1,531,221 in 1914, an increase of \$16,875. After adding miscellaneous income of \$235,978, the total revenue from all sources amounted to \$1,784,074, an increase of \$17,076. The operating and maintenance expenses were \$924,817 as compared to \$913,101, an increase of \$11,716. The fixed charges and taxes of all kinds totaled \$739,482, leaving a net surplus of \$119,775. This, added to that of last year, made a total surplus to date of \$347,499. The report states that the properties of the company and its various subsidiaries have been maintained on the usual basis, \$193,898 having been expended on maintenance account during the year.

Sacramento Valley Electric Railroad, Dixon, Cal.—In the foreclosure suit of S. H. Palmer and A. D. McBride, contractors against the Sacramento Valley Electric Railroad, Judge O'Donnell has rendered judgment for \$27,388 in favor of the plaintiffs. Roscoe M. Griffin has been appointed commissioner to sell the property and satisfy the judgment. The line at present consists of a 12-mile unit operated under lease by the Oakland, Antioch & Eastern Railway from Dixon to Dixon Junction. This unit is a part of the electric line planned from Red Bluff, Tehama County, through Willows, Glenn County, and Woodland, Yolo County. Inability to collect on stock subscriptions on account of financial conditions for the last few years is the cause of the non-payment on the cost of contract.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—In addition to the issues noted in the ELECTRIC RAILWAY JOURNAL of Sept. 11 and Oct. 23, the San Francisco-Oakland Terminal Railways is now paying deferred interest on September coupons of the Oakland Transit Company first 6's and the Twenty-third Avenue Electric Railway first 6's and on July coupons of the East Shore & Suburban Railway first 5's.

Scioto Valley Traction Company, Columbus, Ohio.—At the annual meeting of the Scioto Valley Traction Company Sylvio Casparis was elected a director to succeed the late George D. Eustis. The report for the year ended June 30, 1915, showed a decrease of \$22,526 in gross earnings, which was offset to some extent by a decrease of \$13,000 in operating expenses and taxes. The final net income for the year available for dividends was \$97,421, of which \$75,000 was paid out in preferred dividends, leaving a balance of \$21,446 for the common stock, a decrease of \$9,608. The profit and loss surplus on June 30, 1915, aggregated \$188,985.

Seattle (Wash.) Municipal Street Railway.—Seattle's municipal lines, Divisions "A" and "C," were operated during September at a loss of \$2,977. The revenues of Division "A" amounted to \$1,699, while the cost of operation was \$1,994. An addition for interest made the total loss for this line \$1,918. It cost \$2,462 to operate the Lake Burien line, Division "C," while the revenues amounted to \$1,403, making a loss of \$1,059.

Stockton Terminal & Eastern Railroad, Stockton, Cal.—It is reported that an assessment of \$10 a share, delinquent on Nov. 10, has been levied on the stock of the Stockton Terminal & Eastern Railroad.

United Railways Investment Company, San Francisco, Cal.—Benjamin Altheimer, St. Louis, Mo., has been elected a director of the United Railways Investment Company to succeed Emil Loeb, resigned. The committee of directors which was appointed at the annual meeting in 1914 to readjust finances has reported that owing to prevailing conditions it was not able to accomplish anything, and it has been discharged.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—The Wilmington & Philadelphia Traction Company has secured control of the Wilmington, New Castle & Delaware City Railway, which operates a 10.5 mile line between New Castle and Delaware City. This purchase, together with that of the Wilmington Southern Traction Company, noted in the ELECTRIC RAILWAY JOURNAL of Oct. 9, places all the trolley lines south of Wilmington in the

hands of the Wilmington & Philadelphia Traction Company. Plans of the incoming management include the general improvement and speeding up of the service. The line from New Castle to Delaware City, heretofore operated on the storage-battery system, will be converted to the overhead type of construction, and the entire line from Wilmington to Delaware City will receive extensive improvements. Under the new plan the system will operate from Darby, along the Delaware River, through Eddystone, Chester, Marcus Hook, Wilmington and New Castle to Delaware City, as well as on the line in Media and the lines connecting Media with Chester and Philadelphia.

DIVIDENDS DECLARED

Bangor Railway & Electric Company, Bangor, Me., quarterly, one-half of 1 per cent, common.

Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., quarterly, one-half of 1 per cent, ordinary.

Cape Breton Electric Company, Ltd., Sydney, N. S., 3 per cent, preferred; 1½ per cent, common.

East St. Louis & Suburban Company, East St. Louis, Ill., quarterly, three-fourths of 1 per cent, preferred.

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me., quarterly, 1½ per cent, preferred.

Lincoln (Neb.) Traction Company, quarterly, 1½ per cent, preferred.

Montreal (Que.) Tramways, quarterly, 2½ per cent, common.

Tampa (Fla.) Electric Company, quarterly, 2½ per cent.

Traffic and Transportation

JITNEY JOTTINGS

Operators of Jitneys in Brooklyn Required to Apply to Commission—Decision Expected in Philadelphia Case

The Public Service Commission for the First District of New York has notified Marius Jorgenson and the Cook Sight Seeing Company that it will be necessary for them to apply to the commission to continue the operation of jitney lines which they have started in Brooklyn. Mr. Jorgenson is running a line in the Bay Ridge section of Brooklyn, and the Cook Sight Seeing Company is operating a line along Atlantic Avenue, from Nostrand Avenue to Flatbush Avenue. The commission has already approved the application of one company to operate jitneys in Greater New York. This was the application of the Far Rockaway Transportation Company, Inc., dated July 15, 1915. The company started the operation of three routes in and around Far Rockaway.

The threatened civil proceedings to be brought by the Philadelphia City Solicitor's office to recover the fines and costs imposed by magistrates on drivers of automobiles arrested for violating the jitney ordinance has been stayed by an order made by Judge Patterson, in the Quarter Sessions Court. Harry M. Berkowitz, an attorney, appealed from the summary conviction of Charles Helig before Magistrate Beaton. Helig was arrested on Oct. 4 and fined \$5 and costs by the magistrate. He was unable to pay the penalty and the magistrate discharged him, it being stated that civil suits would be begun by the City Solicitor against all individuals arrested under similar circumstances who refused to pay their fines. Judge Patterson decided not to hear the appeal at this time for the reason that he is preparing an opinion in another case which would probably cover all the points to be raised on this appeal. It is expected that the opinion referred to will settle the heretofore confused status of the jitney in Philadelphia.

The Supreme Court of Tennessee has upheld the law passed by the Legislature last winter providing that previous to operation jitney lines must secure a municipal franchise and file indemnity bonds with the state.

The San Joaquin Light & Power Corporation on Oct. 15 put in service a fleet of automobiles to supplement the service of its street car system. The machines are to be replaced later, it is reported, by ten-passenger motor buses. The service is in districts hitherto dependent upon jitneys.

Judge Thornton W. Sargent of the District Court of Sedgewick County, Kan., recently held valid Wichita's ordinance regulating jitneys, and dissolved an order restraining the city officials from enforcing the ordinance. The ordinance requires jitney owners to pay licenses ranging from \$25 to \$50 a year, according to the capacity of the car. A further provision is that if the jitneys are to operate on streets where there are street car lines, the licenses shall range from \$300 to \$400 a year. The ordinance was contested on the ground that it was discriminatory because it exacted a greater license for the jitneys on streets where there were car tracks than on streets unoccupied by such tracks. The court held that there was no discrimination among jitney owners, and that the purpose to protect the street car business was laudable and proper.

No decision has been rendered by the Eleventh District Court in the case of the Houston, Tex., jitney ordinance. This ordinance is temporarily restrained by injunction, but 200 operators had paid the yearly license fee of \$72 before the injunction was granted. These operators claim that the ordinance is beneficial to the business and should be strictly enforced. Other jitney men who are contesting the ordinance are operating in competition with those who have paid the license fee, claiming that it is impossible to operate under the ordinance at a profit. If the court upholds the ordinance it will doubtless be amended to require an indemnity bond. The City Commission has been advised by an insurance company that a bond protecting both passengers and pedestrians to the extent of \$2,500 would be written for \$225 a year. For a premium of \$150 a year the company will write a bond for pedestrians only.

FIRST JITNEY CASE BEFORE NEW YORK PUBLIC SERVICE COMMISSION

Commission Lays Down the Principles Which Will Govern It in Future Applications

The principles which guided the Public Service Commission of the Second District of New York in granting certificates for four of the six jitney routes provided for in the franchises granted in New Rochelle, to which brief reference was made in the *ELECTRIC RAILWAY JOURNAL* of Oct. 22, page 890, were as follows:

The duty of the commission to protect already established utilities under its jurisdiction from unnecessary competition is reiterated.

It is held that the commission's duty to the public, entitled at least to some individual liberty in their choice of means of transportation, should come before its duty to protect vested capital except where such choice would lead to competition surely ruinous to interests which the public assumes to regulate.

It is recognized that owing to recent improvements in automobile construction and maintenance of public highways the motor-bus line rather than the trolley will be the relief sought by persons residing away from existing trolley lines who desire transportation facilities.

The four routes authorized run on the same streets with existing trolley lines only for the short distances necessary to reach the New Haven Railroad station, which, due to the commuting nature of New Rochelle's population, is the heart of its urban transit system; with this exception they run on other streets, many of them not parallel to and many some distance away from existing trolley lines. This is held not to be competition which the commission should prevent, but a healthy growth toward the further development of the community tending to aid rather than to hurt the existing transportation agencies. In other words both "convenience" and "necessity" are held to have been proved in the case of these routes.

The two routes for which certificates are refused would have run parallel to and on the same streets with existing trolley lines through their entire route, and through a territory sparsely built up by persons of wealth many of whom maintain their own private means of transportation. While it is held that the contention of the applicant, that the increased facilities provided by his bus lines would help develop this territory and add to the convenience of its inhabitants might have been sustained, no proof was adduced of the "necessity" of these lines and their authorization was refused.

The commission refuses to pass upon the validity of the franchise as it may be affected by the contention of the trolley corporation that it was irregularly advertised or as to the manner in which the action of the commission in approving some and disapproving other routes may affect the validity of the franchise. The opinion confines the decision specifically to the question of the public convenience and necessity of the routes proposed and leaves other questions to "other tribunals."

The provisions of the franchise for these lines which Commissioner Emmet mentions as "designed to be of benefit to the local traveling public" are that the buses shall seat from ten to seventeen persons; that they shall be of the pay-as-you-enter type; that they shall have pneumatic tires; that they shall be kept in good condition and that all passengers shall have seats; that the fare for any continuous ride on any route shall be 5 cents; that children under five and policemen and firemen on duty shall be carried free; that buses shall run on at least a twenty-minute schedule from 6.30 a. m. to 1.30 a. m., that the franchise shall expire in ten years; that 3 per cent of the gross earnings shall be paid quarterly to the city; that a bond shall be given to insure prompt payment of this and other obligations; that the buses shall stop upon signal at the near side of street crossings, and shall be subject to present and future traffic regulations of the city, and that the franchise shall be forfeited in the event of the insolvency of the holder or of failure to operate the system in accordance with the terms of the franchise.

As to the position of the commission with regard to the

prevention of undue competition with already established utilities, Mr. Emmet says:

"That it (Westchester Electric Railroad) and all other companies similarly situated, are entitled to such protection up to a certain point is a fact beyond any possible question. It was one of the wise and just provisions of the public service commissions law to vest in the commission requisite authority to prevent wasteful and unprofitable competition between privately-owned enterprises engaged in any public utility field. The reasons for doing this were obvious. The people of New York State in their collective capacity have not as yet seen fit to engage largely in any form of government-operated utility enterprise. Individual courage, energy, foresight and a willingness on the part of private investors to risk large sums in bringing modern conveniences within the reach of all men—these have been the only agencies through which, speaking generally, it has hitherto been possible for the people of the State of New York to enjoy the benefits attaching to such necessities of modern life as improved transit, lighting, telephonic and telegraphic facilities. Doubtless, therefore, when it passed the public service commissions law, the Legislature included among its provisions the one we are discussing very largely from a sense of fairness to the private interests already engaged in these fields of work."

Speaking of the effect of this case on future applications to the commission, Mr. Emmet's opinion says:

"Broadly speaking what must guide the commission in all such cases is an enlightened view of what will best, in the long run, serve the public at large. In the last analysis, the protection of investments which have already been made in public utility enterprises in good faith, will be seen to harmonize pretty well with the idea that the public ought always get the benefit of the very best there is in the way of transportation and other similar facilities. The best there is, in the most cases, can probably be most certainly achieved through the policy of protecting our well-managed public service corporations from the sort of competition that in the end leads to the bankruptcy of both competitors to the ultimate injury of the public itself."

KEEPING RAILWAY EMPLOYEES ALERT

Reliability of service resulting in practically 100 per cent efficiency in keeping trains on time has been obtained by the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., by frequent checks on the employees' alertness. Subject to the order of the superintendent, power may be cut off the line for a thirty-second interval at any time. The superintendent issues an order to the dispatcher, who in turn promptly transmits it to the chief engineer of the power house. The promptness with which the chief engineer responds to the order is made a matter of record, and all way stations along the line are required to report immediately the exact time power was cut off. If any of these agents fail to report, an explanation is required. This check assures the superintendent that all way-station agents are alert and on duty and that the power-house crew is ready on short notice to meet any emergency.

The automatic block signals between Gary and South Bend, a distance of 59 miles, afford a similar check on the trainmen. These checks are also made by the superintendent, who always carries a device for short-circuiting a signal, thus allowing the blade to drop to the stop position. This check also includes extinguishing the signal lamp, a condition which has been found difficult for motormen to observe at any considerable distance from the signal, and particularly when the roundel is within the range of the headlight. Efficiency of signal observation is tested once each month, and since the first few times the tests were applied and men were reprimanded, the superintendent has found that the percentage of observations is perfect. The signal in the stop position also tests the dispatcher, who under no condition is authorized to issue an order to the crew to disregard the signal. The dispatcher, however, is permitted to authorize the crew to proceed, but in accordance with the rule which provides that when a signal is in the stop position and no regular meet is scheduled nor order issued for a meet at that point and the telephone is out of order, a train may proceed to the next clear signal

at a speed not to exceed 15 m.p.h. These checks on the alertness of the employees and their adherence to the rules have served materially to increase the efficiency of the service.

FOUR-CENT TICKETS TO BE DISCONTINUED IN THE CITY OF FORT SMITH

The Fort Smith Light & Traction Company, Fort Smith, Ark., has published over the signature of H. C. Hoagland, general manager, the following statement announcing the decision of the company to discontinue the sale of 4-cent tickets on its lines:

"This company has for many years sold twenty-five street car tickets for \$1, or at the rate of 4 cents each. It is necessary to withdraw this privilege, and it is due our patrons that the company give the reasons which have compelled this reluctant decision.

"The principal reason for the sale of tickets at a reduced rate is to increase travel—to induce those who would not otherwise use the cars to do so in order that vacant space be occupied. Railroads on the same principle sell excursion, commutation and 1000-mile tickets at lower rates than their fixed ones.

"The sale of tickets is not increasing the travel on the street cars. Our records show that for the seven months of this year only 15.14 per cent of all pay passengers used tickets, and on the Eleventh Street line only 11.65 per cent used them. If the company was making money under the present rates, it would not withdraw this privilege, but it, like most other business enterprises, is suffering from the general depression, and from other causes.

"The increase in the use of automobiles for pleasure, business and as public utilities, is cutting into street car receipts all over the country. Prohibition has curtailed travel to Fort Smith; it may be argued that it was an undesirable travel, but it did exist, and now it does not exist.

"For two years a 2-cent per mile rate prevailed on the Iron Mountain to and from Van Buren and a 3-cent rate to and from Fort Smith, owing to the trains making an interstate journey to reach and leave the city. To avoid paying the 3-cent rate, the travel on that road largely bought transportation to and from Van Buren and used the street cars between the cities. After this company lost the use of the bridge, the railroad largely retained this travel; and now, should the company again use the bridge, it would only be partially restored, as the railroad has through an injunction secured a restoration of the 3-cent rate.

"The loss of the use of the bridge, and the consequent diversion of much travel over it to railroads, taxis and jitneys, has also cut into the receipts of the company, while not diminishing the expenses.

"Irrespective of this analysis, the figures are the vital facts: The year 1912 was the high tide of the company's business. The gross receipts from the street cars that year were \$226,250. In 1914 (notwithstanding the company still had the use of the bridge) they fell to \$192,368, while the operating expenses fell only \$8,347, a net loss of \$25,535. For the first seven months of 1915, the gross receipts were \$85,875, or at the rate of \$147,212 for the year.

"The operating expenses—and by that is meant bare expenses of operation and taxes (not including fixed charges for interest, dividends on preferred or common stock, or depreciation) did not fall in like proportion because the service maintained and the up-keep of the property, notwithstanding rigid economy, did not permit it.

"For seven months of 1915 the net receipts—only deducting expenses of operation and taxes from its gross receipts—were \$4,337, or at the rate of \$7,504 for the year—a sum insufficient to meet depreciation alone, to say nothing of interest or return on the investment.

"The company has only once paid a dividend on its common stock, and that was in 1911, and has paid no dividend on its preferred stock since April, 1913. It is apparent that the company must increase its gross receipts as it cannot decrease its expenses without impairment of its service, and it feels that the public is entitled to the best service its resources permit. For these reasons, much to our regret and owing to causes over which we have no control, 4-cent tickets will not be sold hereafter."

WISCONSIN COMMISSION LIKELY TO CALL FOR SUBMISSION OF OPERATING RULES

On Oct. 21 the Railroad Commission of Wisconsin held a formal hearing at the capitol in Madison on the subject of rules for the operation of electric railways and standards for certain features of construction which affect the adequacy and safety of the service rendered. While the commission used as a basis for the discussion the standard city and interurban codes of the American Electric Railway Association, Commissioner Walter Alexander indicated that the commission probably would not enter an order establishing any set of rules as standard for all roads in Wisconsin.

Only those rules directly affecting safety and adequacy of service were discussed, and it developed that practically all roads wanted substantial modifications of the rules to fit local conditions. This was particularly true of the smaller roads which operate low-speed interurban service without written train orders or regular dispatchers. Opinion of the Wisconsin operating men on the question of color signals, whistle and bell signals, markers and flags was divided.

The subject of car steps, platforms, doors, etc., was discussed at some length. The tentative suggestion of the commission that the first step should not exceed 15 in. above the rail for both city and interurban cars met considerable opposition. The one-man car was given some prominence by the fact that the commission recognized its use and asked for a full discussion of the subject in view of its probably further use throughout the State.

Commissioner Alexander indicated that the commission would probably enter an order requiring each company to submit its operating rules for approval and requiring each company to submit plans for all new and remodeled cars for approval. In this manner the local conditions could be considered in each case.

TRENTON FARE HEARING BEGUN

Case in Which Trenton & Mercer County Traction Corporation Seeks to Substitute Five-Cent Fare for Six Tickets for a Quarter

The case of the Trenton & Mercer County Traction Corporation, Trenton, N. J., before the State Board of Public Utility Commissioners, in which the company is seeking to abolish the sale of strip tickets at the rate of six for a quarter and to substitute a straight 5-cent fare, was begun before the board at Trenton on Oct. 25. With former Mayor Frank S. Katzenbach as its counsel, the company opened its case by the submission of testimony on the part of Rankin Johnson, the president of the corporation. The city of Trenton is represented by City Counsel Charles E. Bird and George L. Record as special counsel. Frank Sommer appears as counsel for the Public Utility Board. The reasons advanced by Mr. Johnson for the change may be summarized as follows:

1. A 5-cent rate of fare is the customary rate, not only in New Jersey, but elsewhere.
2. The franchises of the company provide for a 5-cent rate of fare, and when the principal franchise was granted in 1894 the company assumed many additional obligations.
3. The gross receipts should be sufficient to meet the requirements of operation, maintenance charges, replacements, return on capital invested, and investments for extensions. The public demand a constantly increasing standard of service.

4. The gross receipts were not sufficient to meet the operating expenses, maintenance and other charges.

Mr. Johnson said that the practice used in securing the basis for fixing the rate was to consider the cost of reproduction with reasonable allowances for charges that do not appear and also the value of the proposition as a going concern.

The company then introduced into the record the report made to the Board of Public Utility Commissioners in 1910 by Inspector Philander Betts of the commission. This report was made at the time the Trenton & Mercer County Traction Corporation applied to the board for the approval of the

leases by which it took over the Trenton Street Railway, Trenton, Hamilton & Ewing Traction Company, Mercer County Traction Company and the Trenton, Pennington & Hopewell Railroad. It was upon this report that the utility board approved the leases. The report was admitted as evidence in the case with the distinct understanding that it was accepted merely as the report of Inspector Betts, giving his conclusions as to the valuation of the properties, and was not to be taken in any sense as the finding of the board as to the valuation.

At the continuation of the case on Oct. 26 there were many tilts between counsel as to the details that should be permitted to be entered in the record. Mr. Johnson testified that in 1914 the total receipts of the company were \$776,548 and the operating expenses, replacements, taxes and pay-rolls \$523,861. Since 1910 the company had expended \$821,833 in improvements.

Prizes Awarded for Illinois Traction Scenarios.—Mrs. Rose Marion Boylan, East St. Louis, Ill., won the first prize of \$10 for the best scenario woven about the work of the Illinois Traction System. Mrs. George Alfs, Peoria, Ill., won the second prize of \$5. The title of the first scenario was "Interest on a Loan," and the subject of the second prize was "The Elopers."

Chicago Service Order Before Court.—The Corporation Counsel of Chicago, Ill., filed suit on Oct. 28 in the Circuit Court before Judge Baldwin against the Illinois Public Utilities Commission and the Chicago Surface Lines praying for a temporary restraining order to prevent the railway from complying with the service order recently issued by the commission and summarized in the *ELECTRIC RAILWAY JOURNAL* of Oct. 9, page 775.

Reduction in Round-Trip Fare.—The Puget Sound Electric Company, Tacoma, Wash., has filed an emergency tariff with the Public Service Commission of Washington which reduces the round-trip fare between Tacoma and Puyallup from 40 cents to 25 cents. The 25-cent rate will also apply to any of the midway stations where the round-trip fare now exceeds 25 cents. The reduction will place the fare at the prices of two years ago. The return to the fare previously in force is said to have been made imperative by the competition of the auto bus.

Appeal to I. C. C. in Louisville-Indianapolis Case.—Following the decision of the Interstate Commerce of several months ago by which the commission directed the electric railways operating north into Indiana out of Louisville to divide rates, the Louisville Board of Trade took up the matter of arranging for through shipments of freight north from Indianapolis. Recently it developed that the lines north of Indianapolis and those south of Indianapolis had been unable to agree on the question of divisions of rates. Negotiations between the Louisville Board of Trade and the individual lines north of Indianapolis failed to get results satisfactory to both sides and this question now has been referred to the commission for settlement.

Noon-Day Shop Meetings in New York.—The first of the series of regular Thursday noon-day shop meetings to be held during the forthcoming fall and winter season for the benefit of all employees of the Interborough Rapid Transit Company, New York, N. Y., was held on Sept. 30 in Hedley Hall, attached to the recreation rooms at 240th Street. The meeting was conducted by E. Dana Caulkins, who outlined the plan and scope of the proposed work for the coming year, under which the men themselves will have complete charge of all meetings. The noon-day shop meetings are non-sectarian. Music, short talks on current topics, or advice on matters of health, safety first, economy, food, air, etc., are some of the subjects with which the meetings are concerned.

Reconciling Steam and Electric Freight Rates.—Revision of the rates on heavy freight out of Louisville, Ky., to points on its lines has been begun by the Louisville & Interurban Railway. This is a revision downward, to put these rates on building materials, such as sand and gravel, lumber, concrete blocks and cement and fertilizer, etc., more nearly on a par with the rates of the steam lines for short hauls out of Louisville. As planned, the reduced rates will still remain higher than those of steam lines at competing

points. Seventy-five per cent of the freight haul of the Louisville & Interurban Railway, however, is main-line un-load, which means service that the steam lines cannot give. Some discussion of industrial trackage is being indulged in by officers of the company.

The Gong As a Time-Killer.—That the gong on the front of a car can be made a time-killer as well as a time-saver was the point made by A. F. Connelly, chief inspector of the Louisville (Ky.) Railway, in an address to the trainmen. Mr. Connelly said that such ringing of a gong as will cause resentment on the part of the man driving a wagon or other vehicle on the tracks ahead is a time-wasting practice. The gong, if sounded only as a signal, is generally enough to cause the average driver to pull out, but if the motorman sounds it imperatively and keeps on sounding it after he knows the driver ahead has heard his signal, he is very likely to lose rather than gain. Not only that, but he is likely to be vexed and an accident may result while he is speeding in an effort to catch up with the schedule.

Additional Transfer Ordered in New York.—On the recommendation of Commissioner William Hayward, the Public Service Commission for the First District has ordered the Belt Line Railway Corporation and the Forty-second Street, Manhattanville & St. Nicholas Avenue Railroad, New York, N. Y., to exchange transfers in a manner to enable passengers to ride direct through Fifty-ninth Street to and over the Queensboro Bridge to Long Island City. The order is to take effect on Nov. 15. Under the new order it will be possible for a passenger coming south, for instance, on Broadway in a Third Avenue car to transfer at Fifty-ninth Street to the Belt Line car and then retransfer at Third Avenue to the Forty-second Street Manhattanville car, which goes over the bridge. Heretofore this transfer privilege has not been in effect.

Safety on the Chicago Elevated.—*Elevated News* for September, published by the Chicago (Ill.) Elevated Railways for the purpose of acquainting the people of Chicago with their elevated railway system, contains a reprint of the article "Safety of Trains on the Chicago Elevated," which appeared in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21. Referring to its train accident record the company says: "During the ten-year period ended Dec. 31, 1914, the elevated railroads carried 1,526,632,751 passengers. During this period two passengers met fatal accidents while on trains. This shows the rate of fatal accidents to passengers on trains as one to every 763,316,375 passengers carried. The aggregate number of train trips made per annum is 1,740,416, or a total of 49,015,593 car miles run. This shows the great volume of train movement and compared with the fatal accident record above stated, indicates that elevated service has fewer accidents than any other method of transportation."

Suppressing the Rowdy in New York.—The *New York World* published in its issue of Oct. 24 the second of a series of articles on the suppression of the car rowdy. In introducing the article the *World* said: "The new figures of arrests in car rowdy cases establish the fact of the astounding growth of disorderliness on New York's transit lines. When Sunday rowdyism on subway, elevated and trolleys become so pronounced that 1350 arrests are made for part of a year, as against 622 for the entire year preceding, evidence is not lacking that the special efforts of the police have been made at a time when the conditions were approaching the intolerable. The *World* Sunday, Oct. 17, presented facts showing that thousands of people in New York were forced to remain at home rather than face the dangers incident to travel on the cars when they are commandeered by the rowdy element. It will present further facts bearing on the situation on Sunday, Oct. 31. Police Commissioner Woods, in an authorized statement, tells of the department's efforts to stop the rapidly increasing menace. The number of arrests show that the department is making headway. But before New York's car lines are safe, so that decent citizens may ride to our parks with freedom from insult and attack, further progress must be achieved. 'The police department is after street car rowdyism with all the power at its command,' says the Commissioner."

Personal Mention

Mr. Thomas R. Crumley, who has been superintendent of motive power of the Evansville (Ind.) Railways, has resigned to engage in other work.

Mr. Ira Berry, assistant treasurer of the Galveston (Tex.) Electric Company, has been transferred to the treasurer's department of Stone & Webster at Boston.

Mr. Frank B. Flahive, assistant treasurer of the Paducah Traction & Light Company, Paducah, Ky., has been transferred to the Galveston (Tex.) Electric Company as assistant treasurer of the company to succeed Mr. Ira Berry.

Mr. C. C. Long, electrical engineer of the Reading Transit & Light Company, Reading, Pa., will be relieved of certain duties formerly performed by him by the appointment of Mr. D. S. Miller as manager of power of the company. Mr. Long will continue to report to the president and will devote more of his time to the development of the light and power department. Mr. Long has been with the company twenty-one years.

Mr. W. H. Ogborn has been appointed traffic manager of the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., which has announced that it has decided to go into the carload freight business immediately. The line of the company connects with a number of steam railroads in the industrial district bordering on the shores of Lake Michigan southeast of Chicago. Mr. Ogborn will organize a new department to develop the freight business.

Mr. Glen E. Votaw, superintendent of the Superior and Mesaba Division of the Great Northern Railway, with headquarters in Superior, Wis., has been appointed superintendent of the Spokane, Portland & Seattle Railway, Oregon Trunk Railway, Oregon Electric Railway and the Columbia & Astoria River Railway to succeed Mr. A. J. Davidson, who has been appointed to the Spokane & Inland Empire Railroad, as noted elsewhere in this column.

Mr. A. H. Purdy, who was elected president of the Kansas Public Service Association, successor to the Kansas Gas, Water, Electric Light & Street Railway Association, at the annual meeting of the association in Topeka on Oct. 21, 22 and 23, is general superintendent of the Topeka Edison Company. Mr. Purdy has been connected with the company since he was sixteen years old. He was made secretary and assistant treasurer of the company in 1905 and was promoted to the office of general superintendent of the company in 1910.

Mr. A. J. Davidson, superintendent of the Spokane, Portland & Seattle Railway, with headquarters in Portland, Ore., will become superintendent of the Spokane & Inland Empire Railroad and the Spokane (Wash.) Traction Company on Nov. 1 to succeed Mr. E. E. Lillie, who is to be transferred. In addition to being superintendent of the Spokane, Portland & Seattle Railway, Mr. Davidson is superintendent of the Oregon Trunk Railway, Oregon Electric Railway, United Railways, Portland, and the Columbia & Astoria River Railway.

Mr. D. S. Miller has been appointed manager of power and lines covering the properties of the Reading Transit & Light Company, Reading, Pa., and its affiliated companies. Mr. Miller was graduated from the Pennsylvania State College in the class of 1900 as an electrical engineer. He spent a year with the General Electric Company in the testing department and on outside construction work and later on with the Sprague Electric Company, New York, as erecting engineer. For about three years he was with the Boston (Mass.) Elevated Railway as assistant engineer. He has been with electric properties controlled by the New York, New Haven & Hartford Railroad for the last nine years, these lines embracing electric railways in Connecticut, Massachusetts, Rhode Island and part of New York State. During his connection with the New York, New Haven & Hartford Railroad he was for three years assistant superintendent of power and lines, for two years was electrical engineer and was supervisor of power and lines of the company's electric railway properties when leaving New Haven to assume his new work in Reading.

Mr. H. C. Mason, general manager of the Benton Harbor-St. Joe Railway & Light Company, Benton Harbor, Mich., one of the pioneers in the electric railway and lighting field of the Central West, has resigned, effective on Dec. 1, 1915. Mr. Mason was born in Mason County, Ky., in 1860, and began his street railway career in 1881 as a conductor with the old Newport & Dayton Railway, Dayton, Ky., a horse-car line 3 miles in length. Later he was advanced to superintendent, and on this property he began his business association, with Mr. W. Worth Bean. In 1889 Mr. Bean sold his interest in the Dayton property, now a part of the South Covington & Cincinnati Street Railway, and purchased an old horse-car line in Benton Harbor, Mich., the original Benton Harbor & St. Joe Railway. Soon after taking hold of this property Mr. Mason was made superintendent, and he installed an electric lighting system which since has been extended so that it now supplies electricity to practically all of Berrian County, Mich. In 1892 the horse-car line was electrified under Mr. Mason's supervision and, from time to time, the city lines were extended until they now include 25 miles of track. Later the street railway lines were built beyond the city limits and in time, formed the 50-mile interurban system which now is a part of this property. In 1906 Mr. Bean and Mr. C. B. Holmes, Chicago, sold this lighting and railway property to the C. K. Minary interests. Mr. Mason continued with the property and was made manager. In recent years the Michigan Fruit Belt district has grown rapidly, and a large share of the fruit has been transported over the interurban lines of the Benton Harbor-St. Joe Railway & Light Company to connecting railways and boat lines. Shortly after Mr. Mason's resignation takes effect he will leave for California, where he has a home in Alhambra, and after an extended vacation he will again return to active railway work.

Mr. D. A. Hegarty has resigned as general manager of the Houston Lighting & Power Company 1905, effective on Nov. 1, having been elected president of the Texas Southern Electric Company, Houston, Tex., which operates a number of electric light and power, gas, ice and cold storage plants in Texas. Mr. Hegarty was born in Philadelphia and was educated at the University of Pennsylvania. Leaving the University to become affiliated with the engineering department of the Pennsylvania Railroad, he passed through the various grades of service until he became assistant engineer of construction. He resigned from that position to become associated with Mr. A. Langstaff Johnston in charge of the work of electrifying the railways in Philadelphia. Mr. Hegarty was engineer in charge of construction and became general manager and chief engineer of the Hestonville, Mantua & Fairmount Passenger Railway. When the companies in Philadelphia were merged Mr. Hegarty resigned and accepted a position with the Norfolk (Va.) Railway. He next became manager of the Railways Company General, an operating and construction company with railways, electric light and gas plants in Michigan, New York and Pennsylvania. Resigning from this position Mr. Hegarty became vice-president, treasurer and general manager of the Little Rock Railway & Electric Company, Little Rock, Ark., and was transferred from Little Rock to the management of the railway and lighting department of the New Orleans Railway & Light Company and thence to the general managership of the Houston Lighting & Power Company in 1905. In 1913 he was elected president of the American Electric Railway Transportation & Traffic Association. He is a member of the National Electric Light Association and is a committeeman on the wiring committee of that body. He is also chairman of the illumination committee of the No-Tsu-Oh Association of Houston, Tex.

OBITUARY

William C. Hudson, political writer and author, is dead. Governor Cleveland secured his appointment as secretary of the State Board of Railroad Commissioners in 1883. He is said to have been one of the first to urge the theory that competition is not necessarily an advantage to the community; that it needs to be checked as often as it needs to be encouraged, and that a money-making railroad is the only sort that ever gives public satisfaction in its service. Mr. Hudson held his place on the commission from 1883 to 1894.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

*Patterson & Western Railroad, San Francisco, Cal.—Incorporated in California to construct a railway in Santa Clara and Stanislaus Counties, R. J. Pratt, 3388 Clay Street, San Francisco, is interested.

FRANCHISES

Anniston, Ala.—The Alabama Power Company has received a thirty-year franchise from the Council to construct an extension of its line from Sixth and Lapsley Streets to the Anniston Country Club.

Montgomery, Ala.—The Montgomery Light & Traction Company has asked the Council for a franchise to extend its line from the Day Street terminus west to the city limits.

Stockton, Cal.—The Tidewater Southern Railway's application for a franchise to construct a line on Sutter Street from Hazelton Avenue to Main Street has been denied by the Council.

Peoria, Ill.—The Illinois Traction System has asked the Council for an extension of time for the laying of tracks at the intersection of Hamilton and Jefferson Avenues and for the construction of the traction terminal building. The company says it has expended \$20,000 on the site and has \$30,000 worth of steel in storage in Peoria. Unsettled business conditions constitute the reason for asking this extension.

Newton, Kan.—The Arkansas Valley Interurban Railway has asked the Council for a new franchise at Newton. The former franchise was granted to the company as a street railway. The new one recognizes the company as an interurban railway. It will also give the company additional trackage rights on Newton streets.

Mount Clemens, Mich.—The Council has refused to grant the Detroit United Railway an extension of its franchise in Mount Clemens. The Council ordered the city attorney to advise the company that it must fulfill requirements of its present franchise, which has ten years more to run. The company asked for a franchise extension in consideration of rebuilding the Macomb Street bridge at a cost of \$17,000. The Council's latest action requires the company to place the bridge in a safe condition for operation of cars or forfeit its franchise. Cars are now operated to either end of the structure and passengers are compelled to walk across the bridge.

St. Louis, Mo. — The United Railways of St. Louis has received permits from the Board of Public Service to construct about thirty loops, curves and extensions to facilitate traffic in the rush hours. The improvements will cost about \$125,000. A new system of downtown loops will be installed, car lines will be combined and linked together so transfers may be issued, and the curve at Thirteenth and Locust Streets will be eliminated.

New York, N. Y.—The New York Railways have asked the Board of Estimate of New York for a franchise to construct a double-track line from Central Park through Eighty-sixth Street to Broadway.

Astoria, Ore.—The Pacific Power & Light Company has asked the Council for a thirty-year franchise on Franklin Avenue, Astoria.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company has petitioned the Council for the right to surrender its franchise on Blewett Street, from Fremont Avenue to Albion Place, and on Albion Place, from Blewett Street to Woodland Park Avenue.

Seattle, Wash.—The Council has refused the application of the Seattle, Snohomish & Everett Railway for a two-year extension of time on its franchise to complete its line between Seattle, Snohomish and Everett. David Swank, Seattle, is interested. [Sept. 25, '15.]

TRACK AND ROADWAY

Alabama Power Company, Anniston, Ala.—Work has been begun by this company repairing its tracks on Noble Street at Tenth and Thirteenth Streets. It is estimated that the cost will be about \$3,500. Following the completion of this work the company will begin work on the extension of the line to the Anniston Country Club.

Phoenix (Ariz.) Railway.—Operation has been begun on this company's new Fourth Street line. The old line on First Street between Pierce and Roosevelt Streets and on Roosevelt Street between First and Fourth Streets has been abandoned.

Northern Electric Railway, Chico, Cal.—This company's bridge across the Sacramento River, which was washed out by a flood last February, has been opened for traffic. Train service over the Marysville and Colusa branch of the road, which had been suspended for eight months, has been resumed. The reconstruction of the bridge and its approaches cost about \$50,000, and \$40,000 more was expended in repairing washouts in the roadbed. The cost was apportioned among the counties of Sutter and Colusa, which maintain a highway across the bridge, and the Northern Electric Railway.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—This company has secured control of the Wilmington, New Castle & Delaware City Railway operating between New Castle and Delaware City. This purchase, together with that of the Wilmington Southern Traction Company, places all the trolley lines south of Wilmington in the hands of the Wilmington & Philadelphia Traction Company. Plans of the incoming management include the general improvement and speeding up of the service. The line from New Castle to Delaware City, heretofore operated on the electric storage-battery system, will be converted to the overhead type of construction, and the entire line from Wilmington to Delaware City will be subjected to extensive improvements. Under the new plan the system will operate from Darby, along the Delaware River, through Eddystone, Chester, Marcus Hook, Wilmington and New Castle to Delaware City, as well as on the line in Media and the lines connecting Media with Chester and Philadelphia.

Jacksonville (Fla.) Traction Company.—Work will soon be begun by this company on the construction of double track through Springfield Park from Pearl to Hogan Street.

Waycross Street & Suburban Railway, Waycross, Ga.—Material will soon be received by this company for the completion of its Washington Avenue extension and for extending its Hebardville line through the suburbs northwest of Waycross.

Chicago & Interurban Traction Company, Chicago, Ill.—This company is improving its roadbed at Crete, Ill., the track to be resurfaced with crushed rock.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—W. O. Johnson, receiver for this company, was recently authorized by Judge Landis of the United States District Court to issue receiver's certificates for the construction of a bridge to cost \$40,000. The certificates are to bear interest at 5½ per cent.

Kankakee & Urbana Traction Company, Urbana, Ill.—This company on Nov. 1 will begin to lay track on its extension between Ludlow and Paxton. Grading has been completed to the stream 3½ miles north of Ludlow. Work on the bridge across the stream will be rapidly pushed, and it is believed that cars will be running into Paxton by Jan. 1.

Fort Wayne, Decatur & Southern Traction Company, Decatur, Ind.—This company, which has recently taken over the Fort Wayne & Springfield Railway, plans to build an extension from Decatur to Berne, 12 miles.

Evansville, Chrisney & Eastern Railway, Evansville, Ind.—A report from this company states that construction will be begun about Jan. 1, 1916. Work has been delayed on account of litigation which has been decided in the company's favor. It is proposed to build a line from Boonville to Chrisney, 13 miles, and a line from Boonville to Lynnvile, 11 miles. Surveys have been made of the proposed route. J. P. Chrisney, Chrisney, president. [March 13, '15.]

Tri-City Railway Company of Iowa, Davenport, Iowa.—This company's lease on the skating rink at Watch Tower, Moline, Ill., has expired, and the work of wrecking the rink has been begun. Plans are being considered for a new inn and for the rearrangement of the entire park. Cars will enter the grounds proper instead of following the ravine to the north of the park. The ground now covered by the skating rink will be used for a loop.

Inter-Urban Railway, Des Moines, Iowa.—Plans are being made by this company to build an extension of its line from Colfax to Newton via Metz, 12 miles. Surveys are being made from Colfax east and options for right-of-way are being secured. All materials are to be contracted for winter delivery and the heavier grading will be done through the winter with the view of having the extension ready for operation in July. An extension from Colfax to Jefferson and one from Woodward northwest are also to be begun within the next two years.

Hutchinson (Kan.) Interurban Railway.—This company will begin work at once on the construction of a loop beginning at Main and Carpenter Streets, extending east on Carpenter Street to Elm Street, north on Elm Street to Avenue F, and on Avenue F to Main Street.

Newton, Kansas & Nebraska Railway, Newton, Kan.—A contract has been awarded to the Newton (Kan.) Construction Company for the construction of this company's line through Harvey, McPherson, Dickinson, Saline, Clay and Washington Counties. S. O. Waddell, Newton, chief engineer. [Sept. 25, '15.]

Cumberland Traction Company, Edmonton, Ky.—The capital stock of this company, which proposes to build a line between Edmonton and Elizabethtown, has been increased from \$50,000 to \$250,000. H. P. Rogers, Elizabethtown, has been retained to dispose of the new stock issue. L. J. Metcalfe, Elizabethtown, president. [Sept. 4, '15.]

St. Tammany & New Orleans Railway & Ferry Company, Mandeville, La.—This company has been awarded a five-year contract by the Council for the lighting of streets in Mandeville.

South Boston, Mass.—Bids will be received by the Boston Transit Commission until Nov. 11 for the construction of Section G, Dorchester Tunnel, on Dorchester Avenue between West Fourth Street and Old Colony Avenue, South Boston, about 1200 ft. The structure will be mainly of reinforced concrete. The work includes a pump well with an emergency exit, a ventilating chamber with an emergency exit, an open incline for surface cars, a 6 ft., 6 in., tide-gate chamber on the B Street outfall sewer and sewer changes. Specifications and forms of contract may be obtained at 15 Beacon Street.

Worcester (Mass.) Consolidated Street Railway.—Installation of new block signals and improvements on some of the block signal systems on suburban lines of the Worcester Consolidated Street Railway are under way by men in the employ of the wire and track departments of the company. The most important work is to be done on the Worcester and Clinton lines. Several new signals are to be installed between Woods switch, near the city line, to the Lancaster mills. Other signals are to be installed on the Holden and Northboro lines.

Duluth (Minn.) Street Railway.—Work has been begun by this company on an extension of its lines to Morgan Park. It is expected that the line will be in operation by Dec. 15.

International Railway, Buffalo, N. Y.—Work will be begun between Nov. 1 and Nov. 10 on the extension of this company's line on Eleventh Street to College Avenue, Niagara Falls.

Long Island Railroad, New York, N. Y.—It is reported that this company has ordered 3000 tons of bridge steel from the American Bridge Company.

Hiawassee Valley Railway, Andrews, N. C.—It is reported that grading will be completed within thirty days on this company's line from Andrews to Hayesville. The maximum grades will be 2.5 per cent and the maximum curvature 16 deg. Two steel bridges will be built on the line. S. E. Cover, Andrews, president. [Oct. 9, '15.]

Piedmont & Northern Railway, Charlotte, N. C.—Work has been begun by this company on the construction of an extension from Belmont Junction to Belmont, 4 miles. A contract with the Charlotte Construction Company provides for the completion of this track within forty-five days from Oct. 22. Freight and passenger service will be inaugurated within fifteen days thereafter.

Sapulpa & Oil Field Railway, Sapulpa, Okla.—This company plans to build an electric line from Drumright to Depew or Stroud. J. A. Frates, general superintendent of the first district of the St. Louis & San Francisco Railroad, St. Louis, Mo., has been elected president of the company. C. F. Hopkins, superintendent of the western division of the St. Louis & San Francisco Railroad, Sapulpa, is vice-president and general manager.

Rhode Island Company, Providence, R. I.—Repairs have been begun by this company on its track on Elmwood Avenue, between Harrington and Third Avenues, Norwood.

South Carolina Light, Power & Railways Company, Spartanburg, S. C.—The subject of extensions into property to be selected by the city as a public park is now under consideration by officials of the South Carolina Light, Power & Railways Company. Four sites have been offered the city without price for use as a park with the understanding that the street car lines will be extended into the property so as to make it easily accessible to the entire public.

Chicago & Wisconsin Valley Railroad, Madison, Wis.—Herbert Green & Company, who will finance this company's line, as announced in the last issue of the *ELECTRIC RAILWAY JOURNAL*, state that arrangements have been made with the Illinois Steel Company, Chicago, for 5000 tons of rail to be delivered in February and March. In a letter to the Council of Madison, the company states that, if desired, the work can be begun on Nov. 20, but the company asks that permission be granted to delay the construction work until next spring. [Oct. 23, '15.]

SHOPS AND BUILDINGS

New York Municipal Railway, Brooklyn, N. Y.—The date for the reception of bids for the construction of station finish work on the New Utrecht Avenue elevated line in Brooklyn has been postponed from Oct. 26 to Nov. 5 by the Public Service Commission for the First District of New York. The postponement was made to allow for a change in the form of contract. As the contract first stood, all work was to be completed within six months. Under the new form all stations as far south as Sixty-second Street must be completed within three months. This will allow the operation of the Fourth Avenue subway trains through the Thirty-eighth Street cut and along New Utrecht Avenue to Sixty-second Street, where transfer can be made with the Sea Beach line much earlier than would have been possible under the first form of contract.

Piedmont & Northern Railway, Charlotte, N. C.—This company has purchased property in the heart of Belmont upon which a freight and passenger station of standard design will be erected at once, to be completed by Dec. 21.

Ogden, Logan & Idaho Railway, Ogden, Utah.—This company has awarded a \$125,000 contract to C. F. Dinsmore, Ogden, for the construction of its repair shops and car-houses at Ogden.

Salt Lake & Utah Railroad, Salt Lake City, Utah.—Plans to erect a \$250,000 terminal station in Salt Lake City for the joint use of the Salt Lake & Ogden Railway and the Salt Lake & Utah Railroad are complete. Negotiations for a terminal site on the northwest corner of South Temple and West Temple Streets have been broken off, and unless officials of the railway and the Mormon Church, which owns the property, can get together on the matter, another site must be obtained. As soon as the site is secured, contracts will be let and work rushed.

POWER HOUSES AND SUBSTATIONS

Duluth (Minn.) Street Railway.—Work has been begun by this company on the construction of a new substation at Ninety-second Avenue West and Grand Avenue, Duluth. The station will furnish power for the new extension being built to Morgan Park. It is estimated that the structure and equipment will cost \$25,000.

Manufactures and Supplies

ROLLING STOCK

Des Moines (Ia.) City Railway will order, upon the acceptance of its new franchise, fifty new center-entrance motor cars, instead of twenty-five, as reported in the *ELECTRIC RAILWAY JOURNAL* of Oct. 23.

Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, is having four freight cars constructed in its shops at Elyria. The cars are 52 ft. in length and constructed on the regular standard adopted some time ago by the company.

Muscatine & Iowa City Railway, Muscatine, Iowa, which has acquired a section of the Rock Island lines, as noted in the Financial and Corporate news of this issue, will substitute gasoline-electric motive power for steam power. Negotiations for gas-electric passenger cars and freight locomotives are under way.

Southern Public Utilities Company, Charlotte, N. C., has ordered from the Southern Car Company five one-man arch-roof cars for the street railway system at Anderson, S. C. Three of these cars will be equipped with GE-219-B motors and the other two with Westinghouse "Wee" motors. Taylor trucks with 7-ft. 6-in. wheelbase and 30-in. wheels, will be furnished. The length of these cars is to be 26 ft. They will be all-steel, having steel framing and steel siding. The doors are to be operated by the motorman, and will be folding with a folding step on Southern Car Company's door and step ball-bearing mechanism. Fare boxes are to be located in each end of the car. Ohmer fare registers, Peacock adjustable brakes of the McWhirter type and the Railway Utilities Company's exhaust type ventilators are also specified. This railway company is also having constructed by the Southern Car Company, a one-man car for operation between Belmont and Belmont Junction.

TRADE NOTES

James M. Brown, formerly of the Lorain Steel Company, has been appointed as Western sales manager of the Electric Cable Company, Chicago, Ill., with headquarters in Chicago.

James W. White, formerly manager of the Western sales office of the Electric Cable Company, Chicago, Ill., has resigned and accepted a position with the General Railway Signal Company, as assistant to the vice-president in charge of sales.

General Electric Company, Schenectady, N. Y., has received an order to equip with GE-247 two-motor equipment and K controllers the ten city cars which were recently ordered by the Buffalo & Lake Erie Traction Company from the Southern Car Company.

Carbo Steel Post Company, Chicago, Ill., has changed its name to the Carbo Corporation. No change in the personnel of the organization has been made. Extension of the company's business from its primary trade in the manufacture of fence posts into the manufacture of fence supporting systems, power transmission poles, lighting systems and various types of utilities made of steel for use in the construction of small buildings, has been the cause for the change of the company's name.

N. A. Christensen, Milwaukee, Wis., has received a favorable decision in the United States Circuit Court of Appeals for the Seventh Circuit in the suit brought by him against the National Brake & Electric Company of Milwaukee for infringement of his patent No. 621,324, issued March 21, 1899. The Court held that the combination, covered by Mr. Christensen's patent of "(a) oil-holding, gear-inclosing case, in which the one end of the crankshaft terminated and by which it was protected, dispensing with the undesirable stuffing box, and (b) the compressor case with its parts so arranged as to utilize the oil for both lubricating and cooling purposes, if the motor should be attached to the pump as stated in the other claims," showed more than mere mechanical skill and was a real invention. The decision also discusses the method in which the patent was issued and declared it to have been valid. The attorneys for the National Brake & Electric Company state that they are going

to take up the case to the United States Supreme Court in an application for a writ of certiorari. It is understood that the form of motor compressor on which this suit against the National Brake & Electric Company was brought is not employed by the Westinghouse Company or the General Electric Company in the manufacture of their motor compressors.

ADVERTISING LITERATURE

Roller-Smith Company, New York, N. Y., has issued a catalog describing and illustrating its "Junior Imps," small ammeters and voltmeters for battery charging outfits, small switchboards and similar applications.

Carbo Corporation, Chicago, Ill., formerly known as the Carbo Steel Post Company, has issued a catalog describing its system for supporting right-of-way fencing by means of rigid terminals and earth-cushioned spring supports.

General Electric Company, Schenectady, N. Y., has issued a bulletin describing and illustrating in detail its standard unit d.c. switch panels for railway service, for 600 to 1500-volt operation, which are of single polarity, and of the three-section type, 90 in. or 99 in. high.

Ohmer Fare Register Company, Dayton, Ohio, has issued a pamphlet entitled, "Your Business and Ours." The bulletin quotes testimonial letters in regard to the successful operation of the fare register system of this company by the Pacific Electric Railway, Lehigh Valley Transit Company, Peoples Railway, Denver Tramway, and Southern Public Utilities Company.

Carnegie Steel Company, Pittsburgh, Pa., has issued a catalog containing illustrations of its various types and sizes of bulb angles and bulb beams. The catalog shows a number of sizes of the bulb angle sections particularly designed for strengthening the tops of all-steel gondola freight cars, for which purpose they have now come into use. The pamphlet also contains tables and data on all the profiles of bulb sections at present rolled by this company.

Fadgl Auto Train, Inc., San Francisco, Cal., has issued reprints of illustrated descriptions published in *Leslie's Weekly, California Motor Driver, Exhibitor's Weekly Bulletin, Automobile Topics, San Francisco Examiner* and *San Francisco Hotel Journal* of the Fadgl auto trains, which are in operation at the Panama-Pacific International Exposition at San Francisco, and which are suitable for handling transportation in expositions, parks or other similar places. The company has also issued reprints of a number of complimentary letters on the valuable service performed by these trains at the San Francisco exposition.

A. H. Bickmore & Company, New York, N. Y., have issued an eighteen-page booklet describing the United Light & Railways Company, Grand Rapids, Mich. This contains a description of the properties, a statement of capitalization and securities owned, a general financial statement, a description of its bonds and preferred stock, general information regarding its management, etc., a list of officers and directors, a map of territory served, a map of the Tri-City Railway & Light Company system, a map of the Grand Rapids, Grand Haven & Muskegon Railway, and a chart showing the inter-corporate relation between the United Light & Railways Company and its subsidiary companies. The publication is a praiseworthy example of this company's policy of "complete information for the investor."

Searchlight Company, Chicago, Ill., has issued a booklet containing specific information on the welding and cutting of metals by the oxy-acetylene process, together with a catalog of the equipment necessary for such work. The basis of the oxy-acetylene process is the fact that oxygen and acetylene when burned together at the mouth of a blow pipe torch will produce a temperature of 6300 deg. Fahr., which is twice as great as the melting point of steel. In welding the process consists of applying this intense heat to two pieces of the metal so that their melting edges fuse into one piece. In cutting practically the same process is followed, except that a special cutting torch is employed which uses an extra jet of oxygen. This process has done away largely with the necessity of discarding broken or worn parts and has made the cutting of iron and steel as rapid as the cutting of wood. All that is necessary for welding operations are a cylinder of oxygen, a cylinder of acetylene, a Searchlight torch, and the necessary pressure

regulators with gages. Other useful features have been added, such as extra welding tips for different kinds of work and extra torches for different purposes. For cutting, the only necessary extra outfit is a special cutting torch.

NEW PUBLICATIONS

Accounts—Their Construction and Interpretation. By William Morse Cole. Houghton Mifflin Company, Boston, Mass. 445 pages. Cloth, \$2.25 net.

This revised and enlarged work by Mr. Cole, who is associate professor of accounting in Harvard University, doubtless needs no introduction to electric railway accountants, for this writer is widely known as an unquestioned authority on accounting. The new edition takes up various accounting problems that have lately arisen, adds series of transactions for the visualization of principles and offers rewritten comments on such important topics as depreciation. The first general and non-professional treatise in the accounting field, this book has survived the test of years. It is in no sense an accounting primer, but by virtue of its lucid discussion of accounting principles and its clear-cut analysis of fundamentals, it occupies a place by itself in accounting literature for business men and investors who desire a not too technical but thoroughly sound and modern treatment of corporation accounting.

Financing an Enterprise. By Francis Cooper. The Ronald Press, New York. 524 pages. Cloth, \$3.

The general purpose of this "manual of information and suggestion for promoters, investors and business men generally" is to assist in honest promoting. Hence its scope takes in the investigation of an enterprise, its protection, its capitalization, the presentation to investors and the public, and special features of promotion. The author keeps in view at all times the two parties concerned—the man with the enterprise and the man with the money. One especially valuable feature is the appendix of comprehensive and pertinent questions that will occur to the investor. A careful study of all the points brought out here cannot fail to have a deterrent effect upon expensive and often disastrous mistakes of financing new enterprises. The book has no specific application to electric railway operation, but the principles evolved are basic and as applicable to this as to any industry. The general investor can find in it a wealth of facts he should know about promotion work.

Railroad Accounting. By William E. Hooper. D. Appleton & Company, New York. 461 pages. Cloth, \$2.

This publication is apparently designed for steam railroad investors and students as well as for steam railroad accountants, but only the last-named class will be appreciably aided by the book. The first part, dealing with the forms of accounts and methods of accounting prescribed by the Interstate Commerce Commission, purports to show the "why" involved, but it does little more than show the "what" of the accounts, with infrequent and inconclusive excursions into the critical on points already much mooted. In short, this portion of the book is simply a technical abstract of existing commission classifications for steam railroads, containing for its real substance the complete official text of such classifications. Investors and students who desire a comprehensive and critical analysis of steam railroad accounting can find greater satisfaction in other books previously published.

Nor will the latter portion of the book, dealing with departmental organization and concrete accounting practices, be of interest to the average investor. Yet students of steam railroad accounting practice and accountants in this and allied fields will here find much to interest them. The elaborate system and routine methods that are necessary in railroad accounting and auditing are difficult to describe, and little literature can be found on this general topic. Hence in concretely and lucidly describing the organizations and practices of some of the largest railroads, Mr. Hooper has performed a real service to the profession and atoned as far as possible for the shortcomings of his preceding analytical efforts. Of particularly absorbing interest is the up-to-the-minute concluding chapter on the allocation of revenues and expenses between freight and passenger service. This and the other descriptive chapters will undoubtedly prove instructive and broadening to many accountants in the electric railway field.

THE PERENNIAL FUEL-SAVING HOAX

At almost regular intervals there come before us circulars descriptive of fuel-saving schemes of one kind or another which seem to be designed solely for testing the credulity of a trusting public. Some few years ago we were advised that a pinch of powder scattered over the ash pile would convert it into fuel with a thermal value rivaling the pick of the Pocahontas field, and now comes a statement that the introduction of a tube directing a stream of cold air downward along one side of the stack will secure from the fuel all the heat units that are in it, saving from 10 per cent to 35 per cent of the coal bill. The alleged principle by which the latter result is accomplished is that the stream of air is separated into its two constituent gases, the heavier oxygen falling upon the burning fuel, and thus producing perfect combustion, while the lighter nitrogen rises up the stack, which is thus kept cool and free from fire hazard. This might be a first-rate explanation of the action of the apparatus were it not for the beneficent law of nature which makes the separation of diffused gases by mechanical means as impossible as "settling out" the salt in sea-water, and which thus provides humanity with an atmosphere that is breathable. Nevertheless, the explanation sounds well, and in all likelihood a part of the public will fall for it, conscientiously proclaiming, because of the power of imagination, the savings that the device has effected. The electric railways, it is to be hoped, will not be afflicted with any efforts that may be made to exploit the apparatus, but if they are we offer a reminder of the great ash-burning hoax that was exposed less than ten years back.

MOUNTAIN RAILWAY ELEC- TRIFICATION

One of our correspondents, in commenting upon the article by F. Castiglioni printed in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 23, calls attention to the danger of considering the electrification problem without taking into account all of the factors involved in steam railroad operation. He mentions the matter of train tonnage as having an all-important bearing upon consideration of grade reduction and as leading to a conclusion different from that reached in the article in question. Another correspondent, William Arthur of New Haven, Conn., criticises the method that was used in estimating the tractive effort available for regeneration, namely, the assumption that this is 80 per cent of the grade resistance. While it would be interesting to bring out a discussion on these and other points, the subject is too large for the space limitations of a technical journal.

We understand, however, as far as the first point is concerned that, in writing the article, as indicated by the modest title "Notes on Railway Mountain Electrification," the author did not intend to consider electrification as a whole but only to present some phases which, from observation of three-phase Italian railways, he thought had not been sufficiently emphasized in this country. On the second point, we understand that the approximation used was intended merely as a general guide to the power available for regeneration, the actual power available being dependent upon several factors not discussed in the article but covered by the figure of 80 per cent taken in the article as the regeneration efficiency.

BROADENING A CORRESPONDENCE COURSE

Facilities for collateral reading are widely used in university work for emphasizing the points made by the instructor and for broadening the student's knowledge of the subject. Indeed, it is recognized that the student's acquaintance with the literature of the subject and the sources where any desired information can be found is more important than the exact information that can be memorized only in limited form from the lectures. It is in connection with this fundamental precept that correspondence courses often prove unprofitable, for even when those in charge are sufficiently conversant with sound educational theory to devote careful and extended study to the presentation of a proper course of collateral reading, many and probably most correspondence students are unable to do the outlined reading on account of the unavailability or expensiveness of the suggested books. In cases, therefore, where employees desire to become better educated through a correspondence course along the line of their corporate duties, a corporation can, at comparatively small cost to itself, perform a real educational service by establishing a company library of all required books. We observe with pleasure that The Connecticut Company has shown its firm belief in this policy by establishing an accounting library to be used in connection with the correspondence accounting course. Only a cursory glance at the list of books already purchased, as noted elsewhere in this issue, will suffice to show the value of the authoritative library placed at the employees' disposal. The result is bound to be not only a more substantial interest in the course itself, but also much more permanent results in the way of wider knowledge and increased efficiency in the accounting department. The act might well be emulated by other companies, for it involves only a small investment with a large return.

COMPETITION FROM THE PRIVATE AUTOMOBILE

We have referred in several recent issues of this paper to the competition and consequent loss of revenue which the electric railways have suffered from the private automobile. The electric railways, however, are not the only sufferers among the transportation companies from this cause. During the past summer, as everybody knows, a very large number of persons who formerly visited the mountains or seashore by train for their vacations took an automobile trip instead, often to the same places to which formerly they would have traveled by train. The splendid roads which have been built in all sections of the country, coupled with the large number of automobiles now owned by those who formerly took railroad trips, have made the automobile tour very popular but to the manifest disadvantage of the railroad receipts. No part of the country has been exempt in this particular. Even the Southern Pacific Company, whose lines stretch over the vast expanses of the Far West, has felt the effect to such an extent that this competition is mentioned particularly by Chairman Kruttschnitt in the last annual report of the company.

To the steam railroads the question is probably not as serious as to the electric railways. The inroads of the pleasure automobile have been entirely in the direction of passenger traffic, and this the steam railroad companies have always declared has been the least profitable part of their business. Many of them have even declared that it has been conducted at a loss. On the other hand, automobile trips of the kind to which we refer do not decrease the amount of freight which the steam railroads have to haul. The consumption per capita is just as great as it was before this new means of transportation was introduced. Indeed, the freight business may be more, if a general ownership of automobiles tends to distribute the population and encourages many people, who would otherwise live in the city, to take up residence in the country.

But with the electric roads the situation is different. Their principal business is the transportation of passengers, and the question arises, what can be done in regard to it? Admittedly the matter is discouraging, but it is by no means hopeless.

In the first place, we must admit that the competition cannot be eliminated although we believe that it may be reduced. The automobile manufacturer has added an important, valuable and permanent means to our methods of transportation. At the same time there are certain things which can be done and which in the interest of the public as a whole should be done. There is no doubt that the automobile, with all its benefits, has brought certain evils, and the electric railway official as a citizen and the electric railway company as a taxpayer, in common with other citizens and taxpayers, have a right to protest that their interests should not be subordinated to those of the automobile owner.

Thus it ought to be possible to do a great deal in showing the public that the interests of the community as a whole will suffer if private automobile traffic takes so large an amount of business from the local railway

company that the local railway service has to be curtailed. This point was brought out very clearly in an article by John A. Beeler, published on pages 590 and 591 of our issue of Sept. 18, 1915. This article, which was prepared for general circulation in Denver, declared that after all the only permanent and continuous means of city transportation was the local electric railway. But, as the article then very clearly explained, "the less the patronage, the less frequent the service. The auto owner who picks up a stranger waiting for a street car and transports him, gratis, to or from the residence district, may labor under the delusion that he is doing a kindly act. But the apparent favor is in fact no favor at all but a detriment to all concerned if the reduced patronage to the railway results in reduced car service, with consequent reduced realty values and curtailment of the ability of the company to make extensions." The injury, therefore, is not confined to the local transportation company, but extends to the community as a whole. The man whose neighbors generally use their own cars in going to and from business can hardly expect that the railway company can give as frequent service on the line which he patronizes as if all the residents on that route patronized the trolley line, nor can the real estate owner, who is anxious to have the railway company make extensions to bring his property within the reach of car lines, expect that it will be in a position to do so when the "rides per capita" of the community have been lessened by the general use of automobiles. These are economic facts which deserve more general recognition than they receive.

Another move which the railway company and its officials can make is to advocate a higher license fee for automobiles. This ought to be done in fairness to the community at large. The automobile is the most destructive agent known to-day to road pavement of the "semi-permanent" class and, in consequence, has probably done more to raise the general tax rate during the last ten years than any other one agency. We realize that from time immemorial it has been customary for the man who walks to pay a larger proportion of the taxes than the man who rides. The latter has nearly always been successful in transferring a large part of his taxes to the former. Nevertheless the proportion of taxes which the owner of the automobile pays as an owner of an automobile, in proportion to the direct damage which his car inflicts upon the roadways, is ridiculously small. Usually it is but a small license fee of say \$10 or \$15, whereas, if he paid his fair proportion of the cost of maintaining the roads the license fee would probably be more than \$100 a year. This cost of maintaining the roads in every community is becoming a very serious problem. None of the comparatively inexpensive methods of road paving, which were formerly adequate, now seems to last long under the tire suction of high-speed automobiles. Engineers of country roads especially are in a quandary as to what to do, and, in the meanwhile, automobile associations are continually lobbying for greater and greater expenditures for roads by city, county and State. If the automobile

owners desire and require these large expenditures for road making, they should pay the costs or the greater part of them, as they are the principal beneficiaries, and they should not attempt to saddle the expense upon that part of the community which does not directly benefit from these improvements. This is a matter in which the electric railway company, as a taxpayer, has a vital interest and in which it should receive the cordial support of those in the community who are not owners of buzz-wagons.

HOW RAILWAY ISSUES FARED

Election day this week brought answers to a number of pending electric railway questions in various places, chiefly in New York State, Philadelphia, Cleveland, Detroit and Toledo. In New York State the commendable section of the new constitution providing for making public service commissions constitutional bodies was literally buried under the avalanche of opposition created by other clauses in the proposed fundamental law of the State. In Philadelphia the constitutional amendment giving the city the right to increase its borrowing capacity for the purpose of raising funds for its transit and other permanent developments, was ratified by a large majority, but the placing of another party in municipal office would seem to reopen the whole transportation program adopted by the outgoing administration. The city is, of course, committed by the approval of the citizens to an elaborate subway construction plan, but no definite arrangement was made with the Philadelphia Rapid Transit Company for subway operation by the Blankenburg administration. The rise of local utility stocks on the Philadelphia Stock Exchange the day after election apparently indicates that the outlook for successful adjustment is good.

Perhaps the greatest interest in election results, as far as public utility matters are concerned, centers in Cleveland, Detroit and Toledo. In Cleveland the ill-advised ordinance initiated by the Socialists and providing for city purchase of the street railway lines was lost. In Detroit the municipal ownership proposal was also soundly beaten, while in Toledo a franchise favorable to the city, drafted by municipal representatives and indorsed by representative business organizations in the hope of removing the franchise question from politics, was rejected. Judging by the vote, it appears to us that the Detroit electorate would gladly have adopted what Toledo citizens defeated. We rejoice to see the turning-down of the costly and inefficient municipal ownership proposition in Detroit, and we trust that the same calm good judgment will be exercised by the citizens in handling subsequent questions involving the operation of the city lines. The Detroit United Railway kept strictly out of the election fight, and as a reward to it for this action as well as in the interests of the city itself, some sane and fair plan of settling the franchise question in Detroit should be adopted. The citizens there evidently do not consider municipal ownership the proper solution.

The rejection of the Toledo franchise is lamentable from the viewpoint of the city. Here was an earnest

effort on the part of the city franchise committee to settle a question which had long been an impediment to the city's growth. Eighteen months had been spent in drafting the franchise, and while it would not be considered elsewhere favorable to the utility, the latter had agreed to accept it. Yet through confusing and frightening the voters by misinterpretations of the terms, certain elements brought defeat to the measure, although no word of constructive criticism was offered by them when the instrument was being formulated. Mr. Doherty said before the election that if the measure did not pass the company would do the best it could and it would not sulk. But, naturally, it will not be able to secure the money needed to put the system in first-class shape until some definite agreement is reached. Months and months of progress have undoubtedly been lost, but nobody is at fault except the people of Toledo.

THE PASSING OF A GREAT POWER PLANT

The shutting down of the Ninety-sixth Street power plant of the New York Railways Company is the most striking recent illustration of the operation of the laws of power generation economics. Here is a once world-famous plant, still in its prime as far as physical condition is concerned, put out of commission because it has been out-distanced in the race for low energy-generation cost. The New York Railways load, superimposed upon that of the Interborough Rapid Transit Company, can be carried for a much lower cost by the great plants of the latter than in a separate power plant. The saving is in fuel, labor, maintenance, water, administration; in fact, in all elements of cost. While this is the most conspicuous instance of the practical abandonment of a large plant in favor of purchased power the same principle has been in process of application for a long time in various power systems. The gradual absorption of railway power business by the Commonwealth Edison Company of Chicago is a matter of contemporary history.

We have recently directed attention to the tendency toward the purchase of power, particularly where large plants are involved. A recent example is furnished by the New Haven Railroad, which now receives power for the New York, Westchester & Boston Railway and for part of the electrified steam road from the United Electric Light & Power Company. If we accept as a general principle the assumption that one plant can generate energy more cheaply than two, then it follows that economy results from combining the loads of two plants serving the same territory, provided reliability is not sacrificed by consolidation. Events seem to justify the above assumption. We anticipate, therefore, that in the largest cities particularly there will be larger and fewer power plants. At the same time, as we pointed out editorially last week, the small plant still has a large field in the railway industry. Its problems come nearer to the every-day life of the large number of railway engineers than do those referred to above. There is, however, a great deal that these men can learn from the experience of the large plants which are doing the sensational things in the power field to-day.

Seven Years of Operating Experience of a Single-Phase Interurban Railway

Chicago, Lake Shore & South Bend Railway Has Fine Record for Reliability of Service and Has Greatly Reduced Maintenance Costs and Equipment Failures—Operating Methods and General Results Obtained are Described

On the Chicago, Lake Shore & South Bend Railway, the headquarters of which are at Michigan City, Ind., single-phase equipment has been in service for more than seven years under unusually severe operating conditions. Cars weighing 55 tons frequently attain speeds as high as 68½ m.p.h., 60 and 65 m.p.h. being regularly reached on certain sections of the road. Multiple-unit trains of from two to seven cars, built up on a moment's notice, are operated daily, and enviable results have been obtained both as regards low operating costs and reliability of service.

At the time the Chicago, Lake Shore & South Bend Railway was built it was the most important single-phase installation in this country. It extends along the southern shore of Lake Michigan from Pullman, a suburb 14 miles south of the Chicago loop district, to South Bend, Ind., a distance of 76 miles. In the beginning the cars of the electric line connected with those of the Illinois Central Railroad, a steam road, at Pullman, Ill. About two and one-half years ago, however, a traffic arrangement was made whereby through trains or cars were operated between Gary, Ind., and the Randolph Street station of the Illinois Central Railroad in Chicago. Electric motor cars pull these Chicago coaches or trailers from Gary to Kensington, Ill., where they are coupled to a suburban-type steam locomotive for the trip to Chicago's downtown district.

That portion of the single-phase line between Pullman and Gary is built through the densely-populated industrial district requiring numerous station and road crossing stops, as well as relatively low speeds, because at many points the tracks are laid in the streets. The road from Gary to Pullman is double tracked and

17 miles long, while that from Gary to South Bend, the eastern terminus of the road, is single track and 59 miles long. Between Gary and South Bend there are relatively few stops, and on this section of the line the maximum speeds are attained. At no point on the line is a curvature greater than 10 deg. encountered, and the maximum gradient of approximately 2 per cent obtains only at one or two overhead crossings.

Track is laid with 70-lb. and 85-lb. A.S.C.E. rail and creosoted ties on crushed stone and gravel ballast. The overhead construction consists of No. 0000 grooved, copper trolley wire with a steel contact wire of the same section supported from a catenary messenger wire hung from 9-ft. mast-arms. Poles are 45 ft. long, of longleaf pine creosoted throughout, including the cross-arms, and set in concrete. Track, overhead construction, bridges and other structures are maintained in first-class condition.

METHODS OF HANDLING TRAFFIC

Traffic is confined largely to the passenger business, exclusive of package express handled by one of the standard express companies, milk shipments and passengers' baggage. Beginning Nov. 1, 1915, however, the company began to take on a car-load freight business, for which the line offers great possibilities. Between Gary and Pullman the passenger business is largely local, with morning and evening peaks. During the spring, summer and fall months numerous special parties are handled, and many of these arrive at Gary and Pullman unannounced, making it necessary for the transportation department to be prepared at both these points for any emergency. A passenger

SINGLE-PHASE OPERATION—SINGLE TRACK EAST OF GARY

SINGLE-PHASE OPERATION—MAP SHOWING PART OF CITY OF CHICAGO ON ENLARGED SCALE

SINGLE-PHASE OPERATION—OVERHEAD CONSTRUCTION AT SIDING

coach yard at each of these stations, with plenty of extra cars, enables the transportation department to cope with these instantaneous rushes. Trains to meet these emergencies vary in size up to seven cars each.

Limited trains between South Bend and Gary average about 5 miles between stops, while between Gary and Pullman the average is sixteen stops in 16 miles. This service is performed with a three-car train made up of one motor car and two trail cars. Local trains average about 1 mile between stops during the rush period. When local traffic is heaviest, frequently trailers are handled between South Bend and Gary, and on the remaining trip to Pullman this local train usually hauls two trailers. The ratio of trailers to motor cars operated on a maximum day averages 45 per cent to 50 per cent, and for a normal day from 30 per cent to 35 per cent. Trailers or coaches are added to trains to take care of increased traffic with the following average results: Seat increase, 150 per cent; tonnage increase, 128 per cent, representing a saving in weight per train of 22 per cent. On the normal day 23 per cent of the seats furnished are in trailers and 77 per cent are in motor cars, and on a maximum day the percentages are 44 and 56 respectively.

Regular schedules require twenty-three trains, usually consisting of three or four cars each, between Gary and Pullman, and eleven trains each way consisting of one or two cars each between Gary and South Bend. Local trains make the 76-mile run between South Bend and Pullman in two hours and fifty-two minutes and express trains make the same run in two hours and thirty minutes. The express trains between South Bend and Gary make the 59-mile trip in one hour and forty-two minutes and between Gary and Kensington, a distance of 17 miles, in forty-three minutes.

As an example of the regular morning schedule out

SINGLE-PHASE OPERATION—DOUBLE TRACK BETWEEN GARY AND PULLMAN

SINGLE-PHASE OPERATION—REGULAR CHICAGO-GARY TRAIN

of Pullman, the 6.18 a. m. train is made up of two motor cars and two trailers. One motor car and one trailer are set out at Gary, one trailer at Michigan City and the motor car continues the trip to South Bend. On this trip an average of 685 passengers are handled daily, seventy-two stops are made, and 102 milk cans, ten pieces of baggage and sixty-seven pieces of express are picked up and delivered.

To maintain regular schedules twenty-two main-line crews, eight collectors and four flagmen are required, in addition to four crews for the city-line service between East Chicago and Indiana Harbor. The conductors on excursion trains of three or more cars are held responsible only for the safety of the train while the collectors take up all fares. Between Gary and Pullman each train also carries a flagman who operates all derails and flags trains across the railroad crossings.

Between these two points there are eleven steam railroad crossings, involving the crossing of twenty-five tracks, and three of these crossings are interlocked. The line is also intercepted by one drawbridge, where operators are stationed at all times.

All prospective motormen, upon breaking in, are required to spend four weeks in the shops with the regular repair force. During this time they are paid 17½ cents an hour, and the master mechanic sees that they are made familiar with various defects in the car equipment in the different shop departments. This training, to a certain extent, accounts for the relatively few car failures attributable to the motormen's abuse of equipment. All motormen are examined once a year to refresh their memories concerning the equipment as well as the rules. Upon taking charge of trains all motormen are required to test the brakes and the pantographs as a safety precaution. If additional motor cars are added to multiple-unit trains the brakes and pantographs are again tested.

ROLLING STOCK

The passenger equipment includes eleven passenger motor cars and eight combination motor and baggage cars weighing 55 tons each. There are also ten 50-ft. trail cars weighing 27½ tons each and four 60-ft. trail cars of about the same weight. The passenger cars in single units and in trains are provided with motor capacity as follows: Single motor cars, 9.1 hp. per ton; motor car and one trailer, 6.1 hp. per ton, and motor car and two trailers, 4.6 hp. per ton. These cars are mounted on Baldwin class 90-35 M.C.B. trucks with 7-ft. 6-in. wheelbase. The trucks are fitted with 38-in. rolled-steel wheels mounted on axles 6½ in. in diameter at the center, 7½ in. at the gear seat and 7 in. at the wheel seat. The journals are 5½ in. x 10 in. inclosed in Symington journal boxes and fitted with M.C.B. brasses. All trucks have ball-bearing center bearings designed for a center-plate load of 35,000 lb. The body and electrical equipment on the motor car weighs 59,750 lb. and the trucks and motors 51,600 lb., making the total weight 111,350 lb.

The electrical equipment on the motor cars includes four Westinghouse No. 148 single-phase motors rated at 125 hp. and equipped with multiple-unit control. With this equipment the average energy consumption at the power plant is 5.75-kw.-hr. per car-mile. Considering cars with a seating capacity of sixty-two and a gross weight of 57 tons, the following results are obtained: Watt-hours per ton-mile, 101; per seat-mile,

FOR 1915

93, both at the power plant. In comparing these figures with the results obtained on other properties, it must be borne in mind that the cars of the Chicago, Lake Shore & South Bend Railway are of the Pullman type with a 10-ft. over-all width, a 24-in. aisle, and passenger seats with dimensions and spacing the same as the standard for steam railroads.

EQUIPMENT INSPECTION AND MAINTENANCE

All equipment is thoroughly inspected daily at the terminals and is turned into the general repair shops at Michigan City for general inspection on a 1000-mile basis, or once each week for the motor cars. Owing to the fact that much of the line from Michigan City to Pullman was built through sand dunes, thorough overhauling of the equipment is necessary twice a year. At that time all commutators are turned and slotted and all parts of the equipment thoroughly cleaned and put in first-class running order. Maintenance costs for passenger car bodies and trucks during the year 1914 averaged 1.03 cents per car-mile, and during the year 1915 the average was 1.18 cents per car-mile. Maintenance

SINGLE-PHASE OPERATION—TRANSPORTATION REPORT
FOR 1912

nance of the electrical equipment on these cars during 1914 was 1.52 cents per car-mile and during 1915 it was 1.41 cents per car-mile. In other words, the total cost of equipment maintenance, including bodies, trucks and electrical equipment for 1914, was 2.55 cents per car-mile and in 1915 it was 2.59 cents per car-mile.

Equipment failures classified and credited to the various months of the year indicate that during the period prior to Dec. 31, 1913, there was no perceptible improvement in the number or character of failures. Records for six months in 1910, the years 1911, 1913, 1914 and 1915 are shown. During the last two years it will be noted that the total number of failures dropped from an average of around 300 to less than 200. This result was largely attributed to a change in gear ratio from 25:66 with a 2½ pitch, to a 21:70 gear ratio. This change necessitated a reduction in the maximum schedule speeds to 58 miles per hour, but the reduction

SINGLE-PHASE OPERATION—EQUIPMENT FAILURES FOR 1910-1911

only affected two trains on the regular schedules. Another improvement which materially reduced the number of equipment defects was the introduction of a steel slipper wire suspended beneath the copper trolley wire. This decreased the number of pantograph failures which were principally due to broken trolley wire. A change in the style of pantograph insulator also aided in reducing difficulties in this part of the equipment. Brush-holder failures were decreased by the introduction of an improved brush-holder, and failures in the motor fields, reversers and switch groups, as well as the preventive coils were materially minimized by the lower starting torque obtained with the lower gear ratio.

From the preceding paragraph it might appear that equipment failures were numerous and serious, but that never has been the case. Few electric interurban properties can boast of a more reliable service even when the difference in operating conditions are taken into account. As evidence the service records for the years ending June, 1912, and June, 1915, are shown. These

SINGLE-PHASE OPERATION—DETAILED TABULATION OF MAINTENANCE MATERIALS AND COSTS

records are typical of all those for the past five years. Calculations made from these show that although the per cent of trains on time has changed only a few per cent, a marked reduction in the number and time of detentions has been made. Against 804 delayed in 1912, only 276 were recorded in 1915. This represents an improvement of from 8798 miles per detention to 21,958 miles per detention. This is also most compelling evidence that single-phase equipment has attained a high degree of reliability. In another tabulation the exact amounts of money spent and the quantities and materials used for the first eight months during the present year in the maintenance of equipment are shown. All of these data are totaled and reduced to a cost per 1000 car-miles.

Single-phase electrical equipment, like any d.c. equipment, had to pass through a period of service tests. Surprising as it may seem, however, at no time have defects in the equipment seriously affected the reliability of the service. As shown in the transportation records, the yearly average of trains on time has seldom, if ever, been below 95 per cent during the eight years of operation, and for the year just closed, June 30, 1915, an enviable record of 98.37 per cent of trains on time was made. Records of this kind could not obtain if equipment defects were numerous or serious. In another article to be published soon these defects will be taken up in detail and the methods by which they have been eliminated will be described. The article will also tell how other operating economies have been developed. Enough has already been given to show that, after making allowances for differences in the operating conditions, the character of service and the schedule speeds, the Chicago, Lake Shore & South Bend

W. E. ROLSTON, Supt. O.H.L. & Signals.	

SINGLE-PHASE OPERATION—TYPICAL MONTHLY SIGNAL OPERATION REPORT

Railway has made a fine record for reliability of service and low operating costs. The present condition of the physical property shows the results of permanent construction and careful maintenance. The management can point with pride to a record of 99.3 per cent of trains on time for an entire year, a maintenance cost of 2.55 cents per car-mile on equipment, and 0.854 cent on overhead and signal lines. During the past five years the percentage of trains on time has never been less than 95 per cent, and in the same period equipment failures were reduced from more than 300 to less than 200 per year, representing an improvement from 8798 miles per detention to 21,958 miles per detention. For these excellent results credit must be given to C. N. Wilcoxon, president and general manager, assisted by his able department heads, J. K. Gray, superintendent; J. E. Rolston, chief engineer, and C. E. Heslett, master mechanic.

Utilizing the County Fair in Publicity Work

How An Enterprising Interurban Railway Identified Itself with Its Constituency by Exhibiting at the County Fair

BY W. H. BOYCE, SUPERINTENDENT BEAVER VALLEY TRACTION COMPANY, NEW BRIGHTON, PA.

How many times during county fair days and holidays have we heard the "bromide" exclaim, "I surely would like to have the traction company's receipts to-day!" We have never heard one say, on a winter's night, between 9 and 11 o'clock, "I certainly would like to have what the company earned to-day."

The Beaver Valley Traction Company recently conducted a novel exhibit at the Beaver County Fair for the purpose of demonstrating to the people of the vicinity that all of the nickels garnered by us during those days of the fair were not "velvet," and of impressing upon the public the great variety of ways in which we have appealed to them during our educational campaign for the prevention of accidents. We believe that we made the public think during that week. L. F. Coffin, our master mechanic, was in charge of the booth and explained the operation of the various mechan-

BEAVER VALLEY TRACTION COMPANY'S BOOTH AT BEAVER COUNTY FAIR

ical and electrical devices. A complete straight air-brake equipment was in operation so that the intermittent pumping of the air compressor and the occasional shrieks of the air whistle attracted crowds as well as demonstrated some of the inner workings of a street car.

For our exhibit we had prepared a panel appearing near the center of the partition above, which showed the sixteen operations necessary in removing old paint from a car exterior and in applying the successive coats of primer, surfacing, sanding, applying color, and striping and varnishing. On the floor space we had arranged a platform-type controller, grid resistance boxes, motor frame mounted on a $4\frac{1}{4}$ -in. axle, as shown herewith. We had the whole so wired with carbon lamps as to show clearly the path of the current on different points of the controller. We thus called attention to the large current waste in starting a car so as to give it a comfortable rate of acceleration. The controller, the cover of which was open, showed also the multiplicity of fingers, segments, screws and lock nuts, all of which we used to emphasize the need of continual inspection and renewal.

"Did you ever think"

That we use these Emery Shoes to grind out flat wheels, which annoy you, whenever you do hear one remember that one of these Shoes is fast grinding it out.

"Did you ever think"

That we operate 150 of these Comutators at a cost of \$20 each.

"Did you ever think"

There were so many kinds of Screws in one Street Car.

We Maintain 2,250,600 Sq.ft. of your Street Paving.

"Did you ever think"

That our 3360[#] of these Brasses Cost \$1008 and last only 2 yrs.

"Did you ever think"

That a Controller had so many parts.

"Did you ever think"

The scientific painting of a Street Car requires the application of so many coats. Examine this board closely.

"Did you ever think"

Our Wheels make 16,573,420 Revolutions per day.

"Did you ever think"

Our Trolley Wheels average 22.6 Revolutions per Second.

"Did you ever think"

1½ Tons of these brasses in service, Cost \$670.

CENTRAL FEATURES OF BEAVER VALLEY TRACTION COMPANY'S FAIR BOOTH

We demonstrated the construction of an armature, explaining the methods used in building up laminations, pressing in the shaft, assembling the commutator and placing and connecting the armature coils. The boiler tube, some types of overhead line material, car trimmings, the different and latest types of lighting arresters, which we have installed in our efforts to reduce car failures and delays to the minimum and thus better the service, the daily and yearly coal consumption record painted in yellow on a large block of coal, also shown herewith, all were used to call attention to the variety of our problems.

As a necessary adjunct to the solution of these problems of maintenance and renewal we explained the operation of our modern storeroom and, that we might bring home a little more forcibly the extent of our stock, had arranged a board showing types of screws carried and labelled it—"Did you ever think there were so many kinds of screws in one street car?" We further emphasized our storeroom movements by the sign hung over a journal brass—"Did you ever think—1½ tons of these brasses in service, length of life only one year?"

An excellent water color of the "Capture of the Essex," one of the commerce raiders of the War of 1812, bearing the legend, "Yes, our painter did it," was a tip as to the ability and type of workmen we employ. In this connection a single photograph showing the assemblage at our last Christmas tree and a group of employees' field meet photographs gave the public an insight into our employees' welfare work.

That we might also present the financial problems involved in street railway operation we had arranged a series of rails mounted on two cross-ties and used them to illustrate the difference in cost of construction twenty-five years ago and to-day.

Another sign read as follows:

"Your fare has not increased but—

"Operating expenses 1906 = _____"

"Operating expenses 1914 = _____"

We went even further and presented a portion of our 1914 expense account, showing cost of maintenance of equipment, of production of power, trainmen and car-house employees' wages, bridge tolls, insurance premiums, maintenance of way costs, etc. We gave this cost to demonstrate that our tax burden, both state and county, was high—not low, as is so commonly the impression.

The last and one of the most important phases of our activities as they are related to the public, that of

"safety first," was brought clearly to the attention of all who visited our booth. These give a fair idea of the accident-prevention advertising matter used and show safety-first matter as it formed a background and border for the exhibits and a covering for the walls. We distributed at the booth the following:

1000 safety-first cards for teamsters bearing at the top a large horse blanket pin.

2500 boxes of safety matches, with a warning sticker on one side lettered in red letters on white background: "Safety First Means a Lot to You. The Beaver Valley Traction Company." On the reverse side, in blue letters on white background was: "We Are Doing Everything in Our Power to Prevent Accidents. Will You Do Your Part?"

1000 scratch pads bearing on front cover: "Note Book." "Note Down Safety First for Yourself, Your Relatives and Friends, and The Beaver Valley Traction Company." On the reverse side was a short discourse on "The Perils of the Street."

1000 halftone booklets given to mothers, the cover bearing a short appeal for safety and the seven pages of the booklet depicting as many ways in which accidents might happen, and a miscellaneous lot, totaling about 1000, of drinking cups, blotters and cards, which we had formerly used in our accident-prevention campaign.

The cost of preparing, installing and removing the appliances in the booth was \$46. The cost of advertising matter was \$56.

As to the amount of good derived, it is too bad that we can't tell you in dollars and cents, isn't it?

Mapping the System on a Window

The Cumberland County Power & Light Company, operating the electric railway service of Portland, Me., and vicinity, effectively advertises the layout of the system by a map painted in colors on the plate-glass window of the waiting room in Monument Square, Portland, as shown in the accompanying halftone. The system extends from Saco to Waterville, and the featuring of the map as a transparency attracts much attention from both inside and outside the waiting room.

DISPLAY OF MAP ON WAITING-ROOM WINDOW AT PORTLAND, ME.

Graphics in Maintenance Work

Examples of Graphical Records of Various Kinds Used in Modern Electric Railway Practice, Together with Some Generalizations Based Thereon

Observation of the practice of electric railway companies in different parts of the country indicates that the use of graphical records in electric railway shops is on the increase. Such records have long been used in the power and distribution, accounting and transportation departments, but are only beginning to be appreciated in the equipment department. Some roads use graphical records on a very large scale, while probably few do not find them helpful in some degree. For the purpose of furnishing an instructive exhibit of the kinds of records that are being found useful a number of typical examples were selected from recent volumes of the *ELECTRIC RAILWAY JOURNAL*. These were chosen as representing good practice and possessing commendable features, but no attempt has been made to draw general conclusions from them. They will suggest to some companies how greater use might be made of this method of presenting data, while others may see how their practice can be simplified.

To be effective the information to be put in graphical

form must be such as can be used in impressing some lesson in the direction of improvement, or such as it is desirable for employees to keep before them, in a comprehensive way. For example, a graphical record of trolley breaks by months and years cannot but lead to study of causes and remedies. Again, an organization chart of a shop maintenance force shows at a glance "who's who" in the company and how the responsibility is subdivided.

The present practice in graphical records appears to comprehend the following varieties for the purposes indicated:

(1) Curves plotted between variable quantities affecting equipment details, such as the relation between current-carrying capacity of spring contacts and the pressure at the point of contact, or the relation of the life of paint and total cost. Such curves are of great value in determining details of practice on the basis of real information. Manufacturers are in a position to furnish data in this form.

(2) Records of costs plotted, usually, against time for maintenance of detail parts and totals. Such are valuable for the determination of the durability of the individual parts of the equipment and especially as a basis for conference and discussion.

MAINTENANCE GRAPHICS—FIGS. 11 AND 12—RAIL-WEAR CURVES, UNITED RAILROADS OF SAN FRANCISCO

MAINTENANCE GRAPHICS—FIG. 8—HOT BEARING RECORD, NEW YORK RAILWAYS

(3) Records of performance, usually on a time basis, such as numbers of cars pulled in by months, car-miles per defective car removed from line, hot-bearing records, etc. These are useful for the same purposes as (2).

(4) Construction progress records, partly for the purpose of insuring the delivery of parts at the times they are needed.

(5) Organization and routeing diagrams.

SAMPLES OF SPECIAL STUDIES

As examples of special studies, Figs. 1, 2, 3 and 4 have been selected.

Fig. 1 is a study made by the Detroit United Railway in the process of reducing the cost of car painting by improving washing methods. It shows at a glance the results of increasing the life of car finish and could be used in selecting paint on an economical basis or, as it was, for determining the best methods of washing. Fig. 2 was used by C. W. Squier in his "Equipment Defects" series of articles, printed in this paper, in indicating how circuit-breaker contact pressures affect carrying capacity. Such data for every element of equipment should be in the hands of all equipment men.

Fig. 3 is from a report of the Board of Supervising Engineers, Chicago Traction. It is typical of the kind of information needed in track work in selecting ties and spikes. By the ingenious plan shown a great deal of information is condensed in a small space. This board makes extensive use of graphical presentation of data. Fig. 4 shows curves prepared by a brush manufacturer in the course of improving his product, but they supply exactly the information needed in the shop. Similar curves between brush pressure and voltage drop, pressure and life of brushes, etc., would also be convenient.

While it is true that the handbooks contain a great deal of this sort of information, yet new curves are always turning up and tests are being made for special purposes. Cross-section paper and cloth of letter size, and larger or smaller, are available for records, and a looseleaf binder furnishes a convenient device for filing purposes.

SAMPLES OF CONTINUOUS COST RECORDS

Continuous records of maintenance cost data are easily kept graphically and the advantages of so doing are obvious from an inspection of Figs. 5, 6 and 7. Fig. 5 is from the New York, Westchester & Boston Railway. It serves to show clearly how the cost of repairs was brought down to a reasonable value until it is nearly down to inspection cost. Fig. 6 gives a more elaborate analysis of the United Railroads of San Francisco records prepared by B. J. Arnold. It contains more records in a single sheet than are usually necessary but has the advantage of condensation. In reading diagrams like Figs. 5 and 6 it is necessary to remember that the points represent average values for the period corresponding to the horizontal units and not instantaneous values. The method of plotting shown in Fig. 7 is preferable because it is easier to read except when several lines which intersect are to be plotted on the same sheet. Fig. 7 is a sample diagram from the equipment department of the New York Railways, which employs graphical records on a large scale. This particular chart was prepared for the purpose of showing the change in maintenance costs over a long period, but similar charts, with the month as the time unit, are plotted for all elements of maintenance cost. These are sent monthly to heads of departments and are made the basis of discussion at staff confer-

MAINTENANCE GRAPHICS—FIG. 13—LUBRICATION RECORD, BROOKLYN RAPID TRANSIT COMPANY

ences. Obviously discussion with the record of operating results at hand in such tangible form cannot but result in more intelligent shop practice. The advantage of keeping such records in some standard form can be seen from Figs. 8 and 9 from different roads, for if it is profitable to compare performance month by month on one system it is equally so to make inter-company comparisons.

Cost diagrams can often contain other information as to factors affecting cost as, for example, in Fig. 10, which was prepared by the efficiency engineering department of The Milwaukee Railway & Light Company. It shows the effect of introducing a premium system in the flooring of cars. Cars 631 to 633 were framed and floored by day work, cars 634 to 657 under the premium system. Line *d* is the bonus time allowed above a standard of 100 hours set from observation on the first three

MAINTENANCE GRAPHICS—FIG. 19—WHEEL-WEAR RECORD FORM, MASSACHUSETTS ELECTRIC COMPANIES

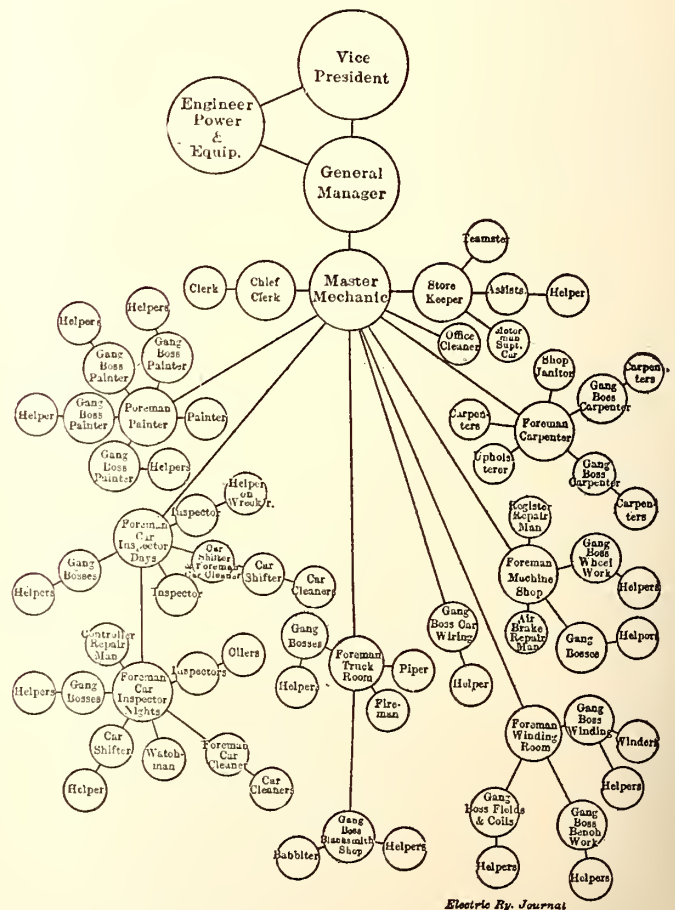

cars. Line *b* is the actual time consumed, in man-hours. Line *c* is the time paid for, and line *a* is the cost to the company for labor on underframe and floor construction.

SAMPLES OF CONTINUOUS PERFORMANCE RECORDS

Another class of diagram, typified in Figs. 11 and 12, is of value in keeping track of performance in terms of

MAINTENANCE GRAPHICS—FIG. 17—WAY CONSTRUCTION DIAGRAM, CONNECTICUT COMPANY

MAINTENANCE GRAPHICS—FIG. 20—ORGANIZATION DIAGRAM, WORCESTER CONSOLIDATED STREET RAILWAY

MAINTENANCE GRAPHICS—FIG. 18—WAY CONSTRUCTION DIAGRAM, BRITISH COLUMBIA ELECTRIC RAILWAY

traffic or time. These diagrams were made by B. F. Legare, engineer maintenance of way United Railroads of San Francisco. They depict rail-head wear, in terms of both traffic and time, by the simplest expedient of indicating time-points on the wear curves by letters. Fig. 13 shows a Brooklyn Rapid Transit daily hot-bearing record, in which a small rectangle represents one hot bearing.

Fig. 14 is a hot-bearing record from the New York Subway showing averages by months. The record for the succeeding year is placed on the same sheet for comparison of similar months. Generally this would answer the same purpose as the preceding and is much cheaper to produce. In Fig. 15 is given a "cars-pulled-in" record of the Connecticut Company, Hartford shops. This company uses similar diagrams for different car troubles, arranging data for comparison of carhouses with a view to stimulating competition. The lines for the several years are distinguished by their character.

SAMPLES OF OTHER FORMS OF GRAPHICAL PRESENTATION OF MAINTENANCE RECORDS

In addition to the examples already cited, there are many special uses of graphics in maintenance work. For instance, autographic records of wheel press pressure, such as shown in Fig. 16 which is from a car-shop hydraulograph operated by the Boston Elevated Railway. Construction progress diagrams are also very useful. The style shown in Fig. 17, as used by the Connecticut Company, is good for general summaries, but for daily records that shown in Fig. 18 is better. The latter is used by the British Columbia Electric Railway of Vancouver. Other forms were shown in an article by Norman Litchfield, printed in the issue of this paper for Feb. 13, page 339.

A wheel record form that combines simplicity and effectiveness is the card used by the Massachusetts Electric Companies and shown in Fig. 19. A history of each pair of wheels is entered on the back of the card. Fig. 20 is the organization chart of the Worcester, Mass., Consolidated Street Railway Company's equipment maintenance department. It is of the form generally used as the construction is simple and it is easy to revise. Such a diagram is worth many hundreds of

words in explaining the subdivision of work and responsibility in the department.

CONCLUSIONS

The foregoing illustrations have been selected from previous issues of this paper to show the usefulness of graphics outside of its original sphere. Drawing is so useful an art in conveying ideas and data regarding construction, and draftsmen, professional or amateur, are so plentiful on any electric railway property that it is but natural that both should be pressed into service in representing more than structural details. The examples indicate a wide variety of novel uses of graphics by a large number of companies.

Foreign Railway Equipment Described

With the object of placing in convenient and accessible form before persons in this country who are interested in railway materials, the United States Bureau of Standards, in connection with its investigation of failures of such material, has obtained, through the courtesy of the State Department, copies of specifications for railway material—rails, axles, wheels, and tires—used in several European countries. These specifications are given in full, together with a digest and discussion, in a forthcoming circular of information from the bureau. Available data concerning the types and weights of foreign railway equipment, together with those concerning derailments and accidents abroad, are included in the circular. Copies of the publication will be furnished on application to the Bureau of Standards, Washington, D. C.

The *Electric Railway and Tramway Journal* states that between 1500 and 1600 motormen and conductors and other employees of the tramways committee in Liverpool, England, have volunteered to give their labor in preparing munitions during their spare time, those most suitable for the work, either by age or training, having been accepted. The offer came spontaneously from the ranks, but the volunteers are paid overtime according to the usual tramway rates, and just now a large number of the men are giving useful service in the turning out of shells.

Illinois Association Meets

The Discussion at Chicago Last Week Was on Interchangeable Mileage, Interurban Rates of Fare, Oxy-Acetylene Welding for Bonds, and First-Aid Work

Experience with interchangeable mileage, electric interurban rates of fare, oxy-acetylene welded bonding and first-aid work on electric railways were the principal topics discussed at the meeting of the Illinois Electric Railway Association held at the Hotel La Salle, Chicago, Ill., on Oct. 29. About seventy-five railway and manufacturers' representatives attended this meeting and President F. E. Fisher presided. The report of the traffic committee called attention to the fact that many Illinois electric interurban lines were not participating in the use of the interchangeable coupon books. Some of the roads have cheaper local books which have reduced or eliminated the sale of the association book and thereby diminished the results which would obtain from its more general use. To improve this situation the committee urged all lines to become members of the agreement and to abolish all other forms of coupon books except those good on their own lines.

The traffic committee also recommended that the executive committee consider the question of interurban railway fares and whether the 5-cent zone system shall be continued, or whether fares shall be figured on a 2-cents-per-mile basis. Another question considered was whether permission should be granted to conductors to cut cash-fare slips for the proper fare except where the amount does not end in zero or five, when they are authorized to collect the next higher amount ending in zero or five. It was suggested that where more than 2 cents a mile was collected by the conductor, a provision should be printed on the cash fare slip that any ticket agent would refund the difference between the amount collected and the correct rate of fare.

Another suggestion by the traffic committee was that the president of the association appoint one man to act as agent and all members of the association give him power of attorney to file joint tariffs with the state and interstate commissions and to issue coupon books as requested by the various member companies. The committee also suggested that the member companies do what they could to encourage the proposed law to permit steam railroads of the State to charge 2½ cents per mile for passenger business. The report was signed by T. W. Gregory, East St. Louis & Suburban Railway; W. M. Brown, Central Illinois Public Service Company; A. M. Farrell, Chicago, Ottawa & Peoria Railway, and Richard Breckinridge, Aurora, Elgin & Chicago Railroad.

In the discussion which followed this report, J. R. Blackhall, Chicago & Joliet Electric Railway, said that he was particularly anxious to have an expression of opinion regarding the proper method of calculating the rates of fare. He said that his company was preparing a new rate schedule and that he would like to see some definite action on the part of the association as to whether the basis should be the 5-cent zone or 2 cents per mile. He said that in Indiana and Ohio interurban lines collected 2 cents per mile, while in Illinois the fares were based on 2 cents per mile, but collections made in multiples of 5 cents. Mr. Blackhall also pointed out that the Chicago & Milwaukee Electric Railroad had received the approval of the Wisconsin commission to increase its fares to approximately 2 cents per mile, whereas a similar increase on the Illinois section of that road had not been granted

by the Illinois commission. To set before the commission the views of the electric interurban roads in Illinois, it was important that all should agree to a common basis of calculating fares, and action by the association in this respect was desirable.

C. J. Jones, Aurora, Elgin & Chicago Railroad, and R. E. Dill, Joliet & Eastern Traction Company, also outlined their experience with coupon mileage and expressed the opinion that their companies would be willing to join in the more general use of the association's interchangeable mileage. In closing the discussion President Fisher called attention to the fact that the interchangeable mileage coupon books sold for \$8.50, whereas the coupon books generally used by roads to the exclusion of the association book were sold for \$5. He said that the higher-priced book was more desirable if all lines would come into the agreement and the cheaper or \$5 book if only a few roads were in. He said it was not the purpose to substitute the association mileage books for those used on any one road but only for passenger interchange. If the interchangeable book were sold for less than \$8.50, it would be so cheap that anyone would use it in place of paying regular fares. At the suggestion of one of the members, Secretary Griffin was instructed to communicate with all member companies requesting that they withdraw their own interchangeable mileage and substitute the association mileage.

G. T. Seeley, Elevated Railroads of Chicago, chairman of the sub-committee of the engineering committee investigating power economy on the car, reported that good progress had been made and that a report would be forthcoming soon. E. E. Soules, Illinois Traction System, chairman of the publicity committee, reported that the association map had been checked by all companies and when this information was transferred the map would be ready for publication.

At this point President Fisher again took up the question of the proper method of calculating rates of fares. He stated that all members were vitally interested in obtaining more revenue, and all should give serious consideration to increased fares where the fares could legally be raised. He said that his company thought of adding a 5-cent train fare to all cash fares collected on trains. This was to be done to encourage ticket sales and facilitate fare collection. He said that the Joliet & Eastern Traction Company had adopted such a plan and had practically eliminated all cash fares on the train. In connection with this plan, however, it was necessary to authorize conductors to collect the exact fare after certain hours at stations where agents were not on duty after stated hours at night. This was also true of road-crossing stops where no agents were maintained.

J. R. Blackhall favored fixing rates on a 2-cents-per-mile basis and eliminating the 5-cent zone system, because in equalizing the companies could not legitimately collect a fare greater than 2 cents per mile. It was also possible to make a charge of 2½ cents per mile for a train fare.

In closing Mr. Blackhall recommended that a committee be appointed to work out a scheme of calculating fares on interurban roads to be adopted by the association. Accordingly President Fisher appointed Mr. Blackhall, A. M. Farrell, Chicago, Ottawa & Peoria

Railway, and W. C. Potter, general passenger agent Illinois Traction System, on this committee.

FIRST-AID WORK

At this point Mr. Seeley called the attention of the association to the good work being done by the medical department of his company in the operation of a first-aid system, and suggested that it might be well for the association to appoint a committee to investigate and report to the association on medical subjects. He also suggested that each company present its medical adviser as a member and urge him to attend at least one meeting of the year which would be devoted to medical subjects. A standing committee could take up medical subjects and physical requirements of the various classes of employees, first-aid systems and instructions, sanitary inspection and medical work in connection with the claim department. Mr. Seeley stated that a higher standard for employees should obtain on electric railways, particularly in the cities where higher wages are being paid. To put this plan before all member companies, the secretary was instructed to outline the plan suggested by Mr. Seeley, in a communication and submit it to all companies for approval.

OXY-ACETYLENE WELDING FOR BONDS

J. R. Brown, engineer Ohio Brass Company, then addressed the association in an illustrated lecture on oxy-acetylene rail bonding. An abstract of this discussion will be published in a later issue of the *ELECTRIC RAILWAY JOURNAL*. It considered the welding equipment, welding methods and the effect of welding temperatures on rail steel.

In the discussion which followed it was brought out that one welder should average ten bonds per hour under traffic. As many as twenty-two bonds per hour had been installed, but this was under exceptional conditions. The standard acetylene and oxygen tanks will weld approximately forty bonds, hence the one welding gang would require three sets of tanks per day, if they average 100 bonds per day. It was also brought out that the electric welder had been replaced on a number of electric roads by the oxy-acetylene welding outfits, because the latter was cheaper to move when the bond replacements were scattered. If there are no leaks in the tanks, the quality of the gas does not deteriorate even after being in storage indefinitely. It was also brought out that welds could be made in any plane and that the metal would flow with the flame. Based on the cost of No. 0000 bonds which to-day is 37 cents, Mr. Brown said that the total cost of an oxy-acetylene welded bond was about 60 cents, including interest and depreciation.

OTHER BUSINESS

As a part of the regular program, E. J. Blair, electrical engineer Elevated Railroads of Chicago, outlined to the members the important topics discussed at the San Francisco convention of the American Electric Railway Association, and what action was taken on them. Dr. H. E. Fisher described, with the aid of lantern slides, the first-aid system in effect on the Elevated Railroads of Chicago. At the close of the meeting the members adjourned to the regular association luncheon.

At a meeting of the executive committee after the luncheon, members of the executive committees of the Illinois Gas Association and the Illinois State Electric Association were present and discussed the proposed amalgamation of these two associations with the Illinois Electric Railway Association. No definite decision was reached, but it was decided that at a meeting later in the year a definite plan will be outlined and submitted

to each association for approval. None of the Illinois associations mentioned is a member of the national bodies, and the numerous overlappings of membership made a consolidation of all three bodies desirable.

Library for Accounting Employees

In connection with the correspondence course of the American Electric Railway Accountants' Association, the educational committee sent out a pamphlet recommending that companies establish a library which would enable the students to pursue the collateral reading indicated in the lectures. The Connecticut Company, New Haven, Conn., recognizing the value of this suggestion, has purchased a few accounting books as the basis of establishing a more complete library as time goes on for the benefit of its large staff of employees in the accounting department. Following is a list of the books already included and their authors:

Net Worth and the Balance Sheet.....	Stockwell
Philosophy of Accounts.....	Sprague
Cost Accounting.....	Nicholson
Theory of Accounts.....	Esquerré
Accounting Practice and Procedure.....	Dickinson
Modern Accounting.....	Hatfield
Accounts—Their Construction and Interpretation.....	Cole
Montgomery's Auditing.....	Montgomery
Getting the Most Out of Business.....	Lewis
